## INDEX OF CONTENTS.

JANUARY TO JUNE, 1880.

## A

- AARON'S ROD, 408, 436, 468, 500  
 Abies Albertiana, 50; *A. bifida*, 308;  
*A. concolor*, 648; *A. lasiocarpa* at  
 Brownsover Hall, 8; *A. Veitchii*, 48  
 Abies or Picea, 243  
 Abutilon, a red, 242  
 Abutilons, on raising seedling, 300  
 Acaëcia longifolia var. *micronata*, 507;  
*A. homalophylla*, 200  
 Acalyphas as table and room plants, 436  
 Acanthorhiza aculeata, 716  
 Acer circinatum, 468  
 Achimenes, basket, at Chatsworth, 210  
 Aciphylla Colensoi, 75  
 "Aeme" labels, the, 110, 183  
 Aconite root, poisoning by, 20  
 Actinidia, a new species of, 754  
 Adiantum fulvum, synonymy of, 110, 182  
 Adjuda, the Dragon tree of, 42  
 Advertising exaggeration, 601  
 Aerides Schroderi, 462; *Veitchii*, 653  
 Aesthetic wild gardening, 786  
 Afghanistan, the vegetation of, 263  
 Agaricus Emerici, 240  
 Agathaea caelestis fol. *variegatis*, 627  
 Agave Regelii *macrodonata*, 189; *A. Vic-*  
*torice Regineæ*, 788  
 Agricultural experience, forty years of,  
 624  
 Agrostis stolonifera, 122  
 Ainslieia Walkeri, 112  
 Ainsworth's, Dr., Orchids, 492  
 Alexandra Park, Manchester, spring bed-  
 ding at, 508  
 Algæ, British, 369  
 Algeria, the flora of, 754; the Grape  
 louse in, 754  
 Allman, Dr., on the winter and the  
 plants, 331  
 Allotment gardens, 393  
 Aloes and Yuccas, 146  
 Alpine garden, an, 269, 425  
 Alpine plant culture, 211  
 Alternantheras, on propagating, 311, 372  
 Amaryllis Ackermannii *pulcherrima*, 341;  
*A. Belladonna*, 653; *A. Mrs. Baker*,  
 716; the yellow, 21  
 Amaryllis and Hyacinths, Mr. Hibberd  
 on, 405; Messrs. Veitch's new seed-  
 ling, 402  
 Amateur gardener's experiences, an, 523  
 America, horticultural notes from, 620;  
 horticultural progress in, 787  
 America, Sorghum cultivation for the  
 production of sugar in, 471  
 American Roses, 265  
 Amorphophallus Kiviëri, 338  
 Amphiscopia Pohlana, 366  
 Anacardium occidentale, 600  
 Anchomanes Hookeri, 434  
 Andaman Islands, new luminous fungi  
 from the, 240  
 Andersson, Dr. Nils Johann, 502  
 Anemone blanda, 433  
 Anemones, seedling, 469  
 Angraecum Christyanum, 806; *A. citra-*  
*tum*, 338; *A. hyaloides*, 264  
 Annuals for pot culture, 491, 523  
 Ant, a soldier, cleverness of a, 376  
 Anthurium Andreanum, 464, 490, 497,  
 561, 502; *A. colocasifolium*, 121; *A.*  
*Scherzerianum*, a bracteate form of,  
 808; *A. S.* var. *pygmaeum*, 630; *A. S.*  
 var. *Rothschildianum*, 366, 631  
 Antibes, the frost at, 23  
 Aphelandra punila, 76  
 Aphelandra Roezlii from seed, 456  
 Apiary: the Ligurian Queen Bee, 80  
 Apple crop prospects, 658  
 Apples, American, 57; for cultivation for  
 market, 273; free bearing, 117  
 Apple trees dying, 724, 757; effects of the  
 winter upon, 602  
 Apricots, the slaughter of the, 53; the  
 frost and the, 308  
 Apricot flowering, memoranda of, 310  
 Aquatic plants, 247  
 Araucaria imbricata, 700  
 Arboretum, the new Edinburgh, 268  
 Arbutus Uredo, 51  
 Argentine Horticultural Society, 16  
 Arisaema concinnum, 434; *A. curvatum*,  
 467; *A. galatum*, 121; *A. speciosum*,  
 338; *A. utile*, 458  
 Aristolochia unguifolia, 817  
 Aristoteia racemosa, 75, 535  
 Aroids, Mr. Brown on some new, 560; at  
 Schlenbrunn, 83  
 Arran, the past winter in, 535  
 Artichokes, Jerusalem, 82; globe, 140  
 Artificial lighting, 436  
 Artificial manures, 300, 470  
 Art in Japan, 592  
 Art in the conservatory, 104, 112, 139,  
 150, 181, 214, 207, 320, 372; in the  
 flower garden, 176  
 Artists' materials, the adulteration of, 601  
 Arundo conspicua, 171  
 Arundo Donax, a new use for the stems  
 of, 469  
 Ash root, deformed, 215  
 Ashton Court, the Orchids at, 466  
 Asparagus, prizes for, 338  
 Asparagus Kale, 372, 404, 490, 499  
 Asparagus plumosus, 789  
 Asplenium Planchetii, 306; *A. viride*, 469;  
 in Vermont and Jamaica, 780  
 Aster, the quilled, as an exhibition flower,  
 342  
 Atlas, Lettis', 145  
 Aubrietias, notes on, 81  
 Aucuba superba, 146, 184  
 Auricula, alpine, A. F. Barron, 458  
 Auricula bloom of 1880, the, 722  
 Auricula, the old Dusty Miller, 508  
 Auriculas, new, 501, 555; notes on, 533;  
 and other flowers, 491  
 Australian Orchids, Fitzgerald's illustra-  
 tions of, 306  
 Autumn Strawberries, 523, 590, 662, 692  
 Autumn, the effects of a dry, 405  
 Azalea Duke of Connaught, 203; *A. Field-*  
*er's White*, 119; *A. Madame L. van*  
*Houtte*, 716; *A. ledifolia* var., 184; *A.*  
*Mrs. Carmichael*, hardiness of, 789  
 Azaleas, 302; and Camellias, American  
 raised, 589; Mr. Carmichael's seedlings,  
 437; note on Chinese, 234; new  
 Indian, 402, 626

## B

Bacon, Lord, on Forcing, 727  
 Bahama Oranges, 660  
 Baillon's *Histoire des Plantes*, 560  
 Banana, a new, 242  
 Bananas, &c., at Ashidge, 786  
 Barb fences, 8  
 Bargains, 274  
 Bark, Carthagenæ, 240  
 Barkera cyclotella, 72, 82, 88, 112; B.  
*elegans*, 716  
 Barometrical tables, 59  
 Baskets, Trug, 373, 402, 495, 436, 469, 499  
 Batemanian Wallisii, 776

Beaumontia grandiflora, 278; in Jamaica,  
 621  
 Bean-cake manure in China, 178, 200,  
 242  
 Bean Field, the, 726  
 Beans, kidney, dwarfs and runners, 553;  
 kidney, 618; history of the, 507; long-  
 pod and broad, 167; the Mazagan,  
 310  
 Beckwith & Sons', Messrs., nurseries,  
 180  
 Bedding-out, 244  
 Bedding-out system, the, 267; the  
 pioneers of the, 22  
 Bedding, spring, summer and winter, 71  
 Bedding plants, propagation of, 531  
 Bee-keeping in Ireland, 440  
 Bees as fertilising agents, 149, 182  
 Beetle, the carpet, 520  
 Begonia Brilliant, 716; *B. Comte de Lim-*  
*minghe*, 340; *B. J. H. Laing*, 203;  
*B. Schmidtiana*, 203; *B. Teuscheri*, 203  
 Begonia, a new seedling, 372  
 Begonias, 302  
 Bellidistram Michellii, 425  
 Bell, Professor, death of, 368  
 Belvoir Castle, the spring flowers at, 457,  
 532  
 Berberis Aquifolium, wine made from,  
 564  
 Bertolonia Hrubiana, 716; *Rodeck-*  
*iana*, 716  
 Betula utilis var., 406  
 Biarritz, notes from, 330, 426  
 Bignonia speciosa, 495  
 Bignoniaceæ, a new herbaceous, 466  
 Bilbergia Liboniana, 507  
 Birch, Japan, 406  
 Birds and berries, 17; and Primroses,  
 279, 505  
 Bitter sweet, effects of, on animals, 117  
 Bitter Vetch, the, 17  
 Blaize Castle, a garden view at, 48; a  
 dell in the grounds of, 80  
 Boea hygrometrica, 76  
 Bohemia, fruit trees in, 814  
 Boilers, horticultural, 22, 54, 86, 119,  
 692, 700; Mr. Ladd's, 76; Messrs.  
 Beckwith's, 77; soot on, 148, 148, 214  
 Boisduval, Dr., death of, 304  
 Bollea caelestis, 203  
 Bone-dust as a manure, 408

 Burford Lodge Orchids, the, 423, 519,  
 610  
 Bush fruit prospects, 658

## C

CABBAGE Broccoli, Gilbert's, 241  
 Cactus, a seedling, 245  
 Caladium argyrites and Scarlet Polargo-  
 niums for winter decoration, 566  
 Caladium argyrites, 508, 620, 662  
 Calanthe Veitchii, 50  
 Calceolaria, the herbaceous (with Coloured  
 Plate), 688; a double, 754; giant her-  
 baceous, 626; Messrs. Sutton's strain  
 of, 722  
 California, troublesome weeds in, 19  
 Californian Tobacco, 808

Calochortus Benthami, 458  
 Caltha leptosepala, 498  
 Camelia Duke of Lancaster, 183  
 Camellias and Azaleas out-of-doors, 304, 402, 437  
 Campanula persicifolia alba flore-pleno, 693  
 Caulophor, the production of, in Japan, 211  
 Canadian notes, 525  
 Cantua dependens, 661, 784  
 Cape Colony, the introduction of plants into, prohibited, 240  
 Cape, fruit growing at the, 524  
 Carex secta, 171  
 Carissa grandiflora, 627  
 Carlina acanthus, 720, 722  
 Carludovica Willsoni, 203  
 Carnation Souvenir de la Malmaison, 532  
 Carpet bedding plants, 370; hardy, 56  
 Carpet beds, 662; at Chelsea Hospital, 616  
 Carpet beetle, the, 520  
 Carthagen bark, 240  
 Castle Ashby, spring bedding at, 814  
 Catalogues, trade, improvement in, 211  
 "Catalogus Plantarum," 502  
 Catalpas, the, 650; C. Bungei, 651; C. bignonioides, 650; C. Koenigii, 651; C. longisiliqua, 651; C. speciosa, 113  
 Catalpa, the durability of the, 276; as a timber tree, 748  
 Catmanche curulea, 278  
 Cattleya citrina, 500; C. crispa superba, 470; C. Mardelii, 776; C. Skinneri, 539, 594  
 Cauliflower, Dean's Early Snowball, 87  
 Cebu, the vegetable products of the island of, 51  
 Cedrus atlantica, 277; C. Deodara shedding its leaves, 243  
 Celery seed, on sowing, 113  
 Celosia pyramidalis plumosa, 594  
 Centigrade thermometer, 18  
 Centropogon Lucayanus, 468  
 Cerastium alpinum, 209  
 Cereals, transmutation in, 214  
 Ceylon Coffee leaf disease, 80  
 Ceylon Coffee soils and manures, 46  
 Ceylon soils suitable for Cinchonas, 778  
 Chamæropis Fortunei and Bambusa Melake, 661  
 Chambers' sand-distributing machine, 587  
 Charcoal dust, 436, 470  
 Chatsworth, notes from, 714; the culture of Achimenes at, 210  
 Cherries, 84; on forcing newly planted, 785  
 Chestnut, the Horse, in Greece, 498  
 Chevalliera Veitchii, 716  
 Chia, 808  
 Chickens in the garden, 761  
 Chilham Castle, Kent, 190  
 Chimonanthus fragrans, 372, 405; not flowering, 436  
 China and Japan, note on some plants introduced from, 234  
 China, bean-cake manure in, 178, 209, 242; opium in, 306  
 Chionodoxa nana, 121  
 Chiswick, Chinese Primroses at, 19; the rockwork at, 336  
 Chives, 808  
 Choisyana ternata, 625, 626, 693  
 Chorospira Greigii, 203  
 Christmas Roses, 74  
 Chrysanthemum frutescens var. Etoile d'Or, 241, 308, 500, 723  
 Chrysanthemums, Japanese, Mr. Fortune on the, 73  
 Chrysochloron Hookeri, 171  
 Chusan Daisy, Mr. Fortune on the origin of the, 73  
 Chysis Sedeni, 610  
 Cigars, concerning, 497  
 Cinchona officinalis var. Bonplandiana, 429; C. officinalis, a Uritisinga, 428; C. succubra in Jamaica, 806  
 Cinchona plantations, the establishment of, in Jamaica, 247  
 Cinchonas, soils suitable for, 778, 809  
 Cineraria, a new type of, 277  
 Cinerarias, double, 338, 408; perfection in, 337  
 Classification in gardens, 136  
 Clay's fertiliser, 500  
 Chytoria alsinoides, 755; C. sibirica, 597  
 Cleaning stove plants, 52  
 Clematis Fairy Queen, 458; C. Louise Carrière, 458  
 Clivanthus Dampieri, 373, 507; C. puniceus, 171  
 Clockwork subservient to the ripening of fruit, 150  
 Clove, Susan Askey, 203  
 Clover and grass seeds, the import and export trade in, 74; the crops of 1879, 114  
 Clover and rib-grass, 119  
 Cockchafer grub in Germany, the, 695  
 Cologne barbata, 8; C. cristata at Holloway, 242; C. humilis var. tricolor, 304; C. Massangeana, 121  
 Coffee, Liberian, 274  
 Coleus Tricolor, 203

College Botanic Garden, Dublin, 690  
 Colours of flowers, the, 594  
 Colour statistics, 619  
 Comelynaeae, the, 200  
 Commercial plants, new, 274  
 COMMITTEE, THE SCIENTIFIC.—Subjects brought before the:—Appointment of a new Secretary, 761; Aristolochia unguiculata, 817; Ash, malformed root of, 88; Ash root, 215; Birch, Japan, 406; Caleolaria, double, 761; Callitriche Plantarum, 502; Colchicum as a cattle poison, 694; Cocoon from Avacha, 88; Crocus, new species of, 215; Cytisus Adami, 604; Dionaea with double lamina to the leaf, 694; Dragon's Blood tree, 566; Effects of the winter of 1879-80, 344; Electric Light, 344, 406; Eucalyptus, gall on, 630, 664; Fir, Spruce, bud variation in, 88; Frustrary, a malformed, 761; Fungus on glass, 502; Insects found upon Juniperus virginiana, 501, 566; Insects injurious to Larch, 566; Injurious insects; report on, 406; Ismene, a hybrid, 761, Japanese objects, 88; Lilium nitidum, 761; New Zealand plants, 88; Peach blossom, malformed, 761, 817; Peach shoots injured by galvanised wire, 215, 343; Pelargonium, an alleged hybrid, 817; Phylloxera at the Cape, 215; Phylloxera question, the, 566, 630, 761; Pitcher on Broccoli, 761; Plant supposed to be poisonous to sheep, 502; Plants exhibited, 344, 406, 501, 566, 630, 761, 817; Plants, unhealthy condition of, 630; Puccinia violarum, 604; Retirement of Mr. Jennings, 406; Sarracenia, insects in pitchers of, 88; Sempervivum, parasite on, 630; Solanum Dulcamara, 88; Tulips, 566; Vine disease, 88; Wood from gravel deposit, 406; Winter and the plants, the, 630; Yeast, destruction of insects by, 88

Conifers, Japanese, 115, 212, 233, 275, 300, 363, 589  
 Conifers, the uprooting of, 182, 215, 246, 308, 373; surface dressing for, 266, 308  
 Conservatory and billiard room, a, 172  
 Conservatory at Eagle Cliff, the, 236  
 Conservatory, art in the, 104, 112, 130, 150, 181, 214, 297, 329, 372  
 Cooke, Edward W., R.A., death of, 41  
 Cool Orchids, 117  
 Coprosma Baueriana variegata, as a bedding plant, 341  
 Cordylina australis, 171  
 Coriaria ruscifolia and C. sarmentosa, 75  
 Cork agricultural experiments, 814  
 Corn, cheapness of, in the sixteenth century, 344  
 Corokia Cotonaster, 76  
 Corydalis Ledebouriana, 369  
 Cottage gardens, 9  
 Couve tronchuda, 341  
 Covent Garden, 805  
 Cowslips on the Coombes, 627  
 Cranbourn Court, spring flowers at, 816; Creepers, wall, 722  
 Crinum podophyllum, 716  
 Cripps, Messrs., nursery at Tunbridge Wells, 658  
 Crocus Korolkowii, 531  
 Crocus, Mr. Maw's monograph of the genus, 434; new species of, 215  
 Crops in the San Louis Valley, 595  
 Cross fertilisation, Dr. Ernst on, 48  
 Croton Barome James de Rothschild, 213, 716; C. Warrenii, 432  
 Crotons, two new, 369; for decorative work, 465  
 Cuckoo, the, 724, 761, 790  
 Cucumbers, 597  
 Cultivation, what it can do, 653  
 Cupressus macrocarpa, 808  
 Currant bushes on railway bankments, 539  
 Custard-Apple, the, 203  
 Cut flowers, green glasses for, 565  
 Cuttings, sea-sand for propagating, 274  
 Cycas media, 716  
 Cybalidium cochleare, 168; C. elegans var. obovatum, 41; C. Mastersii, 136, 458

 Plant portraits, 76, 121, 716  
 Plant thirst and root-rest, 202

PLANTS, NEW GARDEN, DESCRIBED:—  
 Angraecum Christyanum, 806; A. hyaloides, 264; Anthurium Andreanum, 490; Barkeria cyclotella, 76; Batemannia Wallisii, 776; Brassia eucodes, 680; Bulbophyllum iners, 776; Cattleya Mardellii, 776; Chysis Sedenii, 616; C. Cologyne barbata, 8; C. humilis tricolor, 394; Cymbidium coehleare, 168; C. elegans var. obovatum, 41; C. Mastersii, 136; C. Petri, 680; C. Spicerianum, 393; C. stenophyllum, 200; Dendrobium aureum var. philippinense, 72; D. lituiflorum candidum, 586; D. scabrilingue, 616; D. tetrachromum, 712; Epidendrum brachiatum, 648; Eria merguensis, 616; Lælia anceps var. rosea, 104; L. anceps vestalis, 136; L. Dormanniana, 168; L. Perrini var. nivea, 264; Liparis formosana, 394; L. Stricklandiana, 232; Maeradenia Brassavole, 104; Masdevallia Chelsoni, 554; M. militaris, 742; M. pulmonaris, 200; M. rosea, 554, 648, 681; M. vespertilio, 712; M. xanthina, 681; Maxillaria arachnites, 394; Mesospidium incantans, 586; Nepenthes bicalanata, 200, 294; Otonera Saundersiana, 264; Odontoglossum crispum var. flaveolum, 41, 232; O. crispum var. Lehmanni, 712; O. Eduardi, 72; O. Horsmanni, 41; O. Pescatorei limbosum, 169; O. ramosissimum var. xanthinum and viride, 298; O. Rossi musaicum, 205; O. Rossii pallens, 200; O. vellarium Lehmanni, 586; O. Wilekeanum, 298; Oncidium xanthocentron, 104; Pothos celatocaulis, 205; Restrepia Falkenbergii, 232; Thrixspermum Moorei, 104; Tillandsia distachya, 205; Vanda lamellata var. Boxallii, 743; V. Parisii var. Marriotiana, 743

Plants, artificial sources of light and heat for, 429; Dr. Allmann on the winter and the, 331; changing their names, 690; defence in, 304; exhibition at Henwick Grange, 587; and the frost, 437; hardy, for carpet-bedding, 59; hardy, in bloom, 304, 787; hardy, effects of the winter upon, 469; the winter and the, 563; introduced from China and Japan by Mr. Fortune, 11; Japanese, and spring frosts, 627; of the Kurrum Valley, 209; labels for, 215; on labelling, 241; London market, 237; in living rooms, 214; the migration of, and replacement of one species by another, 17; names, 22; new Mexican, 498; the new, of 1870, 739; hardness of Minorcan, 339; by post, 498; on the action of the sun on the foliage of, after rain, 57; effect of uninterrupted sunlight on, 272

Plants, on watering, 239  
 Plumbago rosea, 521  
 Plum prospects, 529  
 Plum, the Waterloo, 151, 187  
 Plum trees, scale on, 789  
 Plums, Date, 109  
 Plums, on the culture of, 83  
 Poetry of a root crop, 61  
 Poinsettia pulcherrima plenissima, 118  
 Poinsettia at Hawkstone, 21  
 Poor soils, 87; on the improvement of, 119  
 Polyanthus, a racemose, 594  
 Polyanthus, seedling gold-leed, 500, 658  
 Polygonum affine, 203  
 Polystichum vestitum, 171  
 Potato, Champion, 52, 117; Magnum Bonum, 20, 178; Finke Kidney, 178  
 Potato crop, the, 786; the Irish, of 1879, 177  
 Potato cultivation, recommendations of the International Potato Committee, 395  
 Potato Diseases Committee, the Irish, 812  
 Potato Exhibition, the International, 59, 176; a Midland Counties', 306  
 Potato famine in Ireland, the, 210  
 Potato flour, 627  
 Potato manures, 500  
 Potatoes, on the cultivation of, 142; on planting, 437; frame, 305; gypsum for, 555; seed, for Ireland, 208, 434; "improvements" in, 54, 81, 118, 144; selected, 149  
 Pothos celatocaulis, 200; P. glauca, 121  
 Poultry, winter laying, 184  
 Poverty in the greenhouse, 364  
 Powell, Mr. John, death of, 502  
 Practical education, 752  
 Primrose, calycanthemy of, 629  
 Primrose, Cloth of Gold, double, 661  
 Primrose, Oxlip, and Cowslip, the, 722  
 Primroses, Birds and, 270, 595

Now Ready, in cloth, 16s.,

**THE GARDENERS' CHRONICLE,**  
Volume XI., JANUARY TO JUNE, 1879.  
W. RICHARDS, 41, Wellington Street, Strand, W.C.

To the Seed Trade.

**WAITE, BURNELL, HUGGINS, AND CO.'S** General Wholesale Seed CATALOGUE is now ready, and will be forwarded on application. A copy was posted to all their Customers on December 23, should it not have been received, another copy will be forwarded on an intimation to that effect being sent them.  
Seed Warehouse, 79, Southwark Street, London, S.E.

**THOMAS RIVERS AND SON** beg to offer **STANDARD PURPLE-LEAVED** (6 to 7 feet, and 5 to 6 feet, well grown grafted trees), also **SCARLET HORSE CHESTNUTS**, 6 feet.  
The Nurseries, Sawbridgeworth, Herts.

Lilies of the Valley.

**JULIUS HOFFMANN,**  
137, Koepnickstrasse, Berlin S.O.  
The Plants are fine this year. Prices, £1 12s. per 1000, £15 per 10,000. Every one strong flowering. Stock, 400,000.

**HARDY CONIFERS and EVERGREENS.**  
—To effect a speedy clearance of the ground, specially low quotations will be given for choice CONIFERS, EVERGREENS, and DECIDUOUS TREES. Gentlemen about to plant are invited to apply for particulars.  
J. J. MARRIOTT, Highfield Nurseries, Matlock, Derbyshire.

**ASH.**—150,000—2 to 3 and 3 to 4 feet—good stout plants, offered to the Trade or otherwise, on very reasonable terms, by  
J. CHEAL AND SONS, Lowfield Nurseries, Crawley, Sussex.

Special List of Cheap Ferns.

**THE ABOVE SPECIAL LIST** of a large number of varieties of FERNS and SELAGINELLAS, offered at very low prices, will be forwarded on application. Ferns being our Speciality, and having an immense stock, we are able to supply them at the most reasonable prices.  
W. AND J. BIRKENHEAD, Fern Nursery, Sale, near Manchester.

Grapes This Year.

**STRONG FRUITING VINES**, thoroughly ripened without bottom-heat; leading kinds 7s. 6d. and 10s. 6d. each; planting Canes 3s. 6d. to 5s. each.  
CATALOGUE on application.  
JAMES DICKSON AND SONS, "Newton" Nurseries, Chester.

**GRAPE VINES.**—Fruiting and Planting Canes of leading sorts.  
FRANCIS R. KINGHORN, Sheen Nurseries, Richmond, Surrey.

To the Trade.

**H. AND F. SHARPE** are now prepared to make Special Offers of their fine selected stocks of **GARDEN and FIELD SEEDS** of 1879 growth.  
Seed Growing Establishment, Wisbech.

**SALE of ORCHIDS.**—Orchid Growers are invited to INSPECT the ORCHIDS of the late Mr. SERJEANT COX, previous to their removal to Stevens' Auction Rooms. For Cards to view, apply to Captain EDWARDS, Moat Mount, Mid Hill, N.W.

To the Trade Only.  
WHITE FLOWERS FOR CHRISTMAS.

**HELLEBORUS NIGER.**—Strong Plants, full of flower-buds, £5 per 100, for cash. Sample ten forwarded on receipt of P.O. for 10s.  
THOMAS KITLEY, Oldfield Nursery, Bath.

Established in 1815.

Hollamby's Nurseries, Groombridge, Tunbridge Wells, 100 Acres to select from.

**EDWIN HOLLAMBY'S** Descriptive Priced CATALOGUE of Roses, Evergreens, and Flowering Shrubs, Conifers, Fruit and Forest Trees, &c., will be forwarded free on application.  
N.B.—Through trucks to all parts: a great saving in packing.

Immense Quantities of

**FOREST TREES, CONIFEROUS, ORNAMENTAL TREES and SHRUBS, ROSES and FRUIT TREES.**

CATALOGUES will be sent free on application.  
LEVAVASSEUR AND SON, Nurserymen, Ussy, Calvados, France.  
Agents: Messrs. R. SILBERRAD AND SON, 15, Harp Lane, Great Tower Street, London, E.C.

Christmas Trees.

**SPRUCE FIRS**, very bushy, suitable for 48 and 32 size pots, 1 1/2 to 2 feet, 35s. per 1000.  
W. BALL AND CO., Bedford Road Nursery, Northampton.

**SPRUCE FIRS.**—Many thousands, 2, 3, 4 and 5 feet. Stout, well furnished, and good rooted.  
ANTHONY WATERER, Knap Hill Nursery, Woking, Surrey.

THE BEST PLANTING SEASON.

THE LAWSON SEED AND NURSERY COMPANY (Limited) respectfully invite attention to their Extensive Stocks of FOREST, ORNAMENTAL, and FRUIT TREES, Dwarf and Standard ROSES, Vines, &c., all in splendid condition.

Where personal inspection is not convenient, special offers will be made, and CATALOGUES sent on request.

Special Railway Tickets to and from the New Nurseries, Granton Road, may be had gratis, at 1, George IV. Bridge.

LILIIUM AURATUM.—Splendid Bulbs of this fine Lily at Reduced Prices, 6s., 9s., 1s. and 1s. 6d. each. For other new Lilies, rare and cheap Orchids, apply for CATALOGUE to WM. GORDON, Bulb and Plant Importer, 10, Cullum Street, London, E.C. Liberal discount to the Trade.

Kent, the Garden of England. COB NUTS, fine Kentish; Kentish PLUMS, CHERRIES, PEARS, DAMSONS and APPLES; specimen MULBERRIES, large AUCUBAS, large LIMES, YUCCAS, and the finest general stock of FRUIT TREES in the Kingdom, some 200,000 to choose from. General Descriptive FRUIT LIST on application. The Trade supplied. THOS. BUNYARD and SONS, Old Nurseries, Maidstone.

New Potato. PRIDE OF ONTARIO. H. AND F. SHARPE have succeeded in securing a very fine Stock of the above-named POTATO, which has given so much satisfaction wherever it has been sent this season, in not only resisting the disease, but producing an excellent yield. Price to the trade on application. Seed Growing Establishment, Wisbech.

A. M. C. JONGKINDT CONINCK, Dedemsvaart, near Zwolle, Netherlands, has much pleasure in offering the following choice hardy perennials and alpine. Prices on application:—ARENARIA CESPITOSA.—A dwarf compact growing alpine, not exceeding 2 inches in height. Almost during the whole summer it is covered with numerous small white flowers. This little gem is sure to become a great favourite when more generally known.

GNAPHALUM LEONOPODIUM (EDELWEISS).—Plants grown in pots sure to bloom next summer. So much admired by tourists in the Alps, so highly spoken of by the horticultural press, that it needs no further description.

JUNCUS EFFUSUS FOL. AUREO STRIATIS.—The golden-striped Rush. A very interesting plant.

JUNCUS EFFUSUS SPERALIS.—Each leaf imitates a cork-screw.

PHLOX SETACEA.—In early spring this charming plant, not exceeding 2 inches in height, produces a profusion of rose-coloured flowers.

SELAGINELLA HELVETICA.—A native of the Swiss Alps. The only reason why this plant is so seldom met with seems to be its perfect hardness, it not being less pretty than indoor Selaginellas.

SEEDLING COLORADO CONIFERS, NURSERY GROWN.

PICEA PUNGENS, (Alies Menziesii Parryana, or "Blue Spruce"), strong 2-yr. old plants, £6 per 1000, £50 per 10,000.

PICEA ENGELMANNI, 2-yr. old plants, £6 per 1000, £50 per 10,000.

PSEUDOTSUGA DOUGLASSII, very strong 2-yr. old plants, £6 per 1000, £50 per 10,000.

ABIES CONCOLOR, very strong 2-yr. old plants, £10 per 1000, £100 per 10,000.

PINUS PONDEROSA, very strong 2-yr. old plants, £30 per 1000, £300 per 10,000.

Sample packages of the above, warranted to reach their destination in good condition, will be sent by mail, post paid, to any address on receipt of an International Money Order for the amount.

100 Picea pungens, 15s. 100 Picea engelmanni, 15s. 25 Abies concolor, 3s. 25 Pseudotsuga Douglasii, 6s. 25 Pinus ponderosa, 4s.

Also to plants of the new CATALPA SPECIOSA for 2s. R. DOUGLAS AND SONS, Waukegan, Illinois, U.S.A.

To the Trade and Large Buyers. ISAAC MATTHEWS AND SON'S Special offer:—

50,000 WILLOWS, Osier, 3 to 4 feet. 20,000 RHODODENDRON, splendidum, white. 20,000 " Jacksoni. 50,000 " Ponticum, 1 1/2 to 2 feet and 2 to 2 1/2 feet.

50,000 " Hybrid Ponticum, seedlings, 1 1/2 to 2 feet. 20,000 " named varieties, 2 feet. 50,000 YEWS, English, 1 1/2 to 2 feet.

For prices and particulars apply to The Nurseries, Milton, Stoke-on-Trent.

New Rose Trees. New Sorts obtained by MARGOTTIN PERE (Prize of Honour Exhibition of 1878, Paris).—22, Grande Rue, Bourglareine (Seine), France.

Hybrides Remontantes. GLOIRE DE BOURG-LA-REINE. HENRIETTE PETIT.

Very vigorous plants; large flowers, most beautiful red-scarlet colouring, surpassing in brilliancy all sorts in existence. Price £1 per plant. Shipments upon orders.

TREES for AVENUE, PARK, OR STREET PLANTING.

ACER DASYCARPUM, 14 to 16 feet, girting 5 to 7 inches. CHESTNUT, Horse, 12 to 14 feet, girting 5 to 7 inches.

" Horse, 14 to 16 feet, girting 8 to 10 inches. " Horse, Scarlet, 10 to 14 feet, girting 6 to 8 inches.

LIMES, 14, 15, 16, 18, and 20 feet, girting 6 to 10 inches. PLANES, Occidental, 10 to 12 feet, girting 4 to 5 inches.

" Occidental, 12 to 14 feet, girting 5 to 6 inches. A few hundred splendid PLANES, 16 to 18 feet, girting 8 to 10 inches.

POPULUS CANADENSIS NOVA, 12 to 14 feet, girting 6 inches. MAPLES, Norway, 12 to 16 feet.

BEECH, Purple, 10 to 12 feet. OAKS, Scarlet, 10 to 12 feet. CHESTNUTS, Spanish, 10 to 12 feet.

CYCAMORE, 12 to 15 feet. They have straight stout clean stems, and handsomely furnished well balanced heads, and from frequently transplanting are splendidly rooted. They are without doubt the finest stock of Avenue Trees to be met with in any Nursery in Europe.

The girth of the stems is taken at 4 feet from the ground, and not at the base, which is often deceptive. ANTHONY WATERER, Kuap Hill Nursery, Woking, Surrey.

Vines—Vines—Vines. J. COWAN, The Vineyard and Nurseries, Granton, near Liverpool, is now offering a large and splendid stock of strong, short jointed, and thoroughly ripened GRAPE VINES, suitable for fruiting in pots and planting Vines. Catalogue free. The Trade supplied.

THE NURSERIES, DUMFRIES. (Established 1787.)

Our stock, which is one of the largest in Scotland, comprises FOREST, FRUIT, and ORNAMENTAL TREES, DECIDUOUS and EVERGREEN SHRUBS, ROSES, GREENHOUSE PLANTS, &c.; also a very large and splendid stock of THORN QUICKS, for hedging and for filling up gaps.

The Trees and Shrubs are of all ages and sizes, and are well adapted for extensive planting, or giving immediate effect in the formation and improving of Ornamental Parks, Pleasure Grounds, &c. Prices on application. Special offers to the Trade. THOMAS KENNEDY AND CO., Seed and Nursery Establishment, Dumfries.

CHOICE SEEDS.—Carriage free. CUCUMBER, Rollisson's Telegraph, warranted true, 2s. 6d. per packet.

BEGONIAS, Gower's Superb Tuberos, saved from the best English and Continental Varieties, 1s. 6d. per packet.

LIST of NOVELTIES, 1879-80.

CHARLES SHARPE & CO.,  
SEED GROWERS AND SEED MERCHANTS,  
SLEAFORD.

SHARPE'S INVINCIBLE  
NEW LONG-PODDED BLUE MARROW PEA.

The Invincible is about 3 feet in height, of a robust branching habit. The pods are produced in pairs, and occasionally three together, from near the ground to the top of the stem—the rows having the appearance of being clothed with pods from top to bottom. The pods are closely packed with from 10 to 12 large Peas, which, when cooked, are of exquisite flavour, and of a beautiful deep green colour.

As a main-crop Pea, either for the Gentleman's Garden or the Market Gardener, CHARLES SHARPE & Co. have no hesitation in saying that the Invincible Pea will be found superior to anything yet sent out.

The Editor of the *Gardeners' Chronicle*, in his review of New Vegetables in the spring of 1875, mentions Sharpe's Invincible as one of the three Peas of the season worthy of notice.

Price, per Quart, 3s. 6d.

Half-pint Packets, free by post, 1s. 6d.

TOMATO, NISBET'S VICTORIA.

This is a seedling from Vick's "Criterion," and for cultivating under glass or in the open air there is no Tomato can approach it for fruitfulness. The plant requires no stopping, as it keeps growing and fruiting in the greatest abundance. The fruit is pyriform and grows in bunches, each bunch containing from eight to twenty fruit, which are the size and colour of a Victoria Plum; it contains but few seeds, and for flavour is unsurpassed.

"The original plant is growing under glass at Aswarby, covering a space 15 feet by 6 feet, and at the present time is carrying a crop of 600 bunches of fruit, as many more having been gathered from it during the summer.—RICHARD NISBET, Gardener, Aswarby Park, August 30, 1879."

Price 2s. 6d. per Packet.

RAUCEBY HALL MELON.

This splendid New Green-fleshed Melon was raised by Mr. Brown, the Gardener at Rauceby Hall, and has been exhibited many times—in every case gaining a First Prize. It is hardy, a fine setter, and a very heavy cropper. The fruit is very beautifully netted, the flesh juicy, sweet, and melting, and of a very rich flavour. Altogether it is a variety of unquestionable superiority, and worthy of a place in every garden. List of Testimonials on application.

Price, 2s. 6d. per Packet.

ASWARBY PARK SEEDLING MELON.

This fine New Melon was raised by Mr. Nisbet, at Aswarby Park, and is a cross between the Victory of Bath and Colston Bassett Seedling, and is certainly one of the Best Melons yet introduced. It is deeply ribbed, finely netted, and when ripening off it changes to a beautiful soft golden colour, thin skinned, great depth in flesh, which is of a rich transparent white; flavour exquisite. Strongly recommended.

Price, 2s. 6d. per Packet.

SHARPE'S "CONQUEROR" LONGPOD BEAN.—The longest and best of all Longpods. Price 1s. 6d. per Pint.

SHARPE'S "EMPEROR" RED BEET.—Splendid stock—dwarf, very deep in colour and glossy. Price 1s. per Packet.

SHARPE'S PRIZE WHITE SPANISH ONION.—It is impossible to obtain anything finer for exhibition purposes than the Seed we now offer. Price 1s. per Packet.

SHARPE'S EXQUISITE CURLED PARSLEY (The Lincoln Green).—The perfection of garnishing Parsley. Price 6d. per Packet.

EDELWEISS.

(GNAPHALIUM LEONTOPODIUM, Jacq.)  
(LEONTOPODIUM ALPINUM, Cass.)

This lovely little alpine, with woolly silvery-white bracteal-leaves, is yet little known in our gardens, though the culture is very easy. Sown early in spring in a flat pot, filled with sandy peat mixed with some good loam and kept moist, it will grow in about a fortnight; replanted and put in a cool frame they will be fit for planting out-of-doors in about six weeks. Any good garden soil, not too stiff, will be sufficient, and a good place freely exposed to the sun will suit them. In the winter a thin cover of leaves will be of use.

Price per Packet, 2s. 6d.

SHARPE'S Extra Choice CALCEOLARIA.—Price 2s. 6d. per Packet.

SHARPE'S Extra Choice CINERARIA.—Price 2s. 6d. per Packet.

SHARPE'S Extra Choice PRIMULA SINENSIS, Red, White, and Mixed.—Price 2s. 6d. per Packet.

These three varieties of Florists' Flowers are the finest ever offered, having been carefully selected for years and grown specially for us.

CHARLES SHARPE and CO., Seed Merchants, Sleaford, beg to intimate that their Descriptive CATALOGUE, with Cultural Instructions, for 1880, is now ready. Post-free on application. The Cultural Instructions have been revised by Mr. WILLIAM INGRAM, The Gardens, Belvoir Castle.

SWANLEY, KENT.

# LÆLIA ANCEPS DAWSONI.

MR. J. C. STEVENS has received instructions from Mr. F. SANDER to SELL by AUCTION, at his Great Rooms, 38, King Street, Covent Garden, W.C., on THURSDAY, January 8, at half-past 12 o'Clock precisely,

A MAGNIFICENT IMPORTATION of the grand and rare LÆLIA ANCEPS DAWSONI.

The masses and pieces are in splendid health, and full of breaks and leaves. The Plants having been brought home in Wardian Cases are in a condition which could not possibly be improved, and having arrived some five weeks since they are all perfectly safe.

At the same time will be offered a magnificent NEW ODONTOGLOSSUM dedicated by Prof. Reichenbach to its discoverer, Mr. F. C. Lehmann—ODONTOGLOSSUM LEHMANNI, Reich.; grand masses of LÆLIA ANCEPS (finest variety), a splendid importation of the beautiful large flowering TRICHOPILIA FRAGRANS, and the splendid red-spotted MORMODES PARDINUM, ODONTOGLOSSUM EDWARDI, the quite new ONCIDIUM XANTOCENTRUM, Reich, which will be shortly described in the *Gardeners' Chronicle*; a large lot of ONCIDIUM MACRANTHUM and MESOSPIDIUM VULCANICUM, MAXILLARIA GRANDIFLORA, a new ANGULOEA and STANHOPEA, PAPHINIA SANDERIANA, NANODES MEDUSÆ; together with an importation of the very rare CHYSIS AUREA and ODONTOGLOSSUM RAMOSISSIMUM, also a new yellow-flowering MAXILLARIA, flowers and drawings of which will be shown.

*May be viewed the morning of Sale, and Catalogues had.*

AUCTION ROOMS AND OFFICES, 38, KING STREET, COVENT GARDEN, LONDON, W.C.

SEND FOR A PRICE LIST OF

## BLAKE'S SELF-ACTING HYDRAULIC RAMS,

*For Raising Water for the Supply of Towns, Villages, Irrigation, Railway Stations, Mansions, Fountains, Farms.*

No Cost for Motive-Power, which is obtained from the Stream of Water passing through the Rams.  
No Oiling or Packing Required.

Made in sizes to raise from 300 to 100,000 Gallons per day.

*Parties requiring a Water Supply should not too readily conclude that the quantity and fall of water, if any is available, is too small to work a Ram before consulting J. B.*

**BLAKE'S SPECIAL RAMS,**

**FOR DEEP-WORKING FALLS,**

*Will force up One Third of the Water passing through them.*

Fig. B.—This Ram will raise a part of the same water that works it, or will raise pure water from a well or spring whilst worked by a stream of impure water, and will force to a height of 1500 feet.

### TESTIMONIALS.

From JOHN TAYLOR, Esq., *The Rocks, Bath, August 22, 1873.*—"The Self-acting Hydraulic Ram you fixed here in March of last year continues to work well. It has only the same quantity of water and fall to work it as the water-wheel and pump which I used previously to force a height of 294 feet, and yet the Ram sends up more than double the quantity of water that the wheel did to the same height."

From W. SCARTH, Esq., *Agent to His Grace the Duke of Cleveland, Darlington, July 16, 1878.*—"The Hydraulic Ram you supplied to his Grace the Duke of Cleveland in 1875 is a complete success. It worked for more than two years without once stopping, and throws more water than promised."

From Major STARKIE, *Lovely Hall, Blackburn, May 13, 1878.*—"Sir,—I have great pleasure in testifying to the good qualities possessed by the Ram you erected here last year. It has done its work well, and not failed as the other Ram did, which was of a different construction, and supplied by a different firm. I consider that there are great difficulties to contend with here, but your practical mechanical knowledge, both as to the construction of the Ram and its situation here, overcame most of the difficulties that we had to contend against."

From JOHN PENNINGTON, Esq., *Emmott Hall, near Colne, December 21, 1868.*—"Sir,—The Self-acting Hydraulic Ram you supplied me with nine months ago continues in excellent condition. It receives water from a spring through a 2-inch pipe, of which it forces 3500 gallons per day of twenty-four hours to a height of 99 feet, exceeding all you promised, and far surpassing the water-wheel and force-pumps which it has displaced. Its cost is small, it occupies but little space (2 square feet), and in mechanical detail is simplicity itself. I have much pleasure in recommending it as a cheap and efficient method of raising water."

From the Right Hon. T. SOTHERON-ESTCOURT, *Estcourt Park, Gloucestershire, September 6, 1875.*—"You will be glad to hear, as I am to tell you, that your Self-acting Hydraulic Ram has worked exceedingly well and continuously since it was erected, more than twelve months ago. It is, in fact, perfectly successful." (The delivery pipe in the above case is 4200 feet long, with a 100 feet rise.)

From Captain TOWNSEND, *Wincham, February 10, 1877.*—"In answer to your inquiry, I am glad to say the Hydraulic Ram you sent me in November, 1875, is working exceedingly well and gives no trouble. It will work when quite immersed, as it has been several times during the floods this winter, forcing up water through a delivery pipe, 900 yards long, at the rate of 80,000 gallons per day, although you only promised 50,000."

From *Deane-water, Wilmslow, November 20, 1873.*—"Dear Sir,—In answer to your inquiries respecting the Hydraulic Ram you supplied me with six months ago, I beg to state that I am more than satisfied with it, as it is in perfect order, sending up to the top of the house about 2000 gallons of water in the twenty-four hours, whereas you only contracted to deliver in that time 500 gallons. I have, therefore, every reason to be well pleased with your work, and more especially as I had a Ram supplied me by another maker which could not send up a single gallon of water to the height required, and a second maker informed me that no Ram with a fall of 3 feet could send up water to the distance required—namely, 120 feet. But yours is an accomplished fact, and does its work most effectually.—Yours, &c., L. HANMER."

From Mr. THOMAS MASON, *Alkmeates Hall, Colne, September 30, 1871.*—"Sir,—Your Self-acting Hydraulic Ram gives me entire satisfaction; it has been at work about fifteen months, and has only been seen once during the last six months; it is forcing about 1400 gallons per day of twenty-four hours, to a height of 194 feet."

**JOHN BLAKE, ENGINEER, ACCRINGTON, LANCASHIRE.**

## PRIZE FLORISTS' FLOWERS.

## JAMES CARTER AND CO.

Direct the special attention of all who wish to procure the best Flowers to the following magnificent strains, many of which have been pronounced by the Horticultural Press to be unsurpassed for perfection of form, brilliancy of colour, and general excellence.

SATURDAY, JANUARY 3, 1880.

THE NEW PLANTS OF 1879.

AMONGST the many introductions of the year just closed there have been none of such extraordinary splendour as to throw a ray of brilliancy upon the sombre hue of a season, the records of which, so far as gardens and gardening are concerned, must be written down as dreary and disappointing. Yet, though we cannot point to any star of the first magnitude as having risen above the floral horizon, we have a galaxy of lesser luminaries, each of which we may assume will throw its own particular ray of beauty across the path of those who, in the future, lovingly watch over it, while some of these minor meteors, though not so dazzling as others which have formerly appeared, may serve to throw a gleam of brightness over the garden, or the greenhouse, in the coming season. Let us then proceed to advert to some of the most remarkable of the novelties of 1879.

**HARDY TREES AND SHRUBS.**

The list is brief, but not unimportant, since it may include the valuable Japanese evergreen coniferous trees which have been recently illustrated in these pages, although it is true that some of them have been in cultivation under other names for some time. *Abies brachyphylla* (xii., p. 557, figs. 91, 92), *homolepis* (xii., p. 823, fig. 136), *Mariesii* (xii., p. 789, fig. 129), and *sachalinensis* (xii., p. 589, fig. 97), all of which may be expected to prove fine additions to the group of Silver Firs, heretofore called *Piceas* in this country—a name which it seems the law of priority, to say nothing of a mistake on the part of Linnæus—what a consolation for his successors!—will prevent them from retaining. So far as can be at present judged they are meritorious introductions, which we shall estimate the more highly when they get up—that is, become more fully developed, and show more of their natural form and character.

As an ornamental flowering tree the *Æsculus rubicunda Briotii*, raised by M. Briot, of Versailles, is highly spoken of for its attractive inflorescence, the blossoms being of a bright violet-tinted red, with an orange-red blotch on the upper division of the flower.

Amongst hardy shrubs, the *Hibiscus syriacus* var. *cælestis* is perhaps the most striking—not absolutely new, but so little known that its novelty has not yet worn off; the flowers, of a soft celestial blue, with crimson eye, are indeed so charming that the shrub ought to be planted in every shrubbery. The variety, which bears the somewhat ungainly name of *H. syriacus totus albus* (*Gardeners' Chronicle*, x., 525, fig. 91), is also a good introduction, the flowers being pure white, and produced with exceptional freeness. Both are of Continental origin. The Japanese *Rosa rugosa*, syn. *R. Regaliana* (*Gardeners' Chronicle*, x., 565, fig. 98), is also not absolutely novel, but is only now beginning to be known; its fine flowers, bold rugose foliage,

and handsome fruits, together with its thoroughly distinct aspect, give it a claim to a very prominent position in every garden. Two fine single white Lilacs, of garden origin, have been made known—*Syringa vulgaris alba grandiflora*, a very fine pure white, far superior to the older whites, and *S. Mdlle. Marie Legeraye*, a splendid form, with white flowers fully an inch across, named by Professor Morren after the raiser, a *fleuriste* of Liège. The *Weigela candida* of the French gardens is another valuable white-flowered hardy shrub, vigorous in habit and very prolific of blossoms, and, like the Lilacs, an invaluable plant for forcing purposes. The *Yucca gloriosa elegans variegata*, which is, we believe, extremely rare, is a remarkably handsome plant, and has appeared at one of the metropolitan exhibitions during the past summer. It is said to be very slow or difficult of increase, but from its fine appearance it deserves to be widely grown.

#### HARDY PERENNIALS.

The most striking plant of this group—in point of genuine botanical interest perhaps the plant of the year—is the *Conandron ramondoides* (*Gardeners' Chronicle*, xii., 232), a native of the higher mountains of Japan, with the habit of *Ramondia pyrenaica*, a dwarf herbaceous plant, with a small glabrous tuber, a solitary or almost solitary ovate-oblong, rugose, coarsely serrated leaf, and a forked cyme on a leafless scape of pinkish flowers, with a subglobose, whitish tube, internally spotted with yellow; its botanical interest consists in its being a regular-flowered, five-stamened *Gesneria*; its horticultural interest in its probable hardness, which, however, has not yet, we believe, been completely tested. Two other pretty tuberous-rooted plants are the *Corydalis Kolpakowskiana* and *C. Ledebouriana*, both dwarf plants with purplish flowers, the latter having broader, less divided, glaucous leaves. A very pretty *Spiraea*, *S. nivosa*, from Japan, with bipinnate leaves made up of obovate cuspidate serrate leaflets, and showy panicles of abundant white flowers, promises to be a useful border plant, and will perhaps be eligible for indoor work also. *Dracocephalum Ruyschiana japonicum* (*Gardeners' Chronicle*, xii., 167, fig. 29), a Japanese labiate, is a showy subject, with bright blue flowers in dense spike-like heads. *Erigeron aurantiacus*, from Eastern Turkestan, has orange-coloured flowers with numerous narrow ligulate flowers, in five or six series resembling the blossoms of the orange *Mesembryanthemum*, and showy if sufficiently numerous. In *Iris Eulefeldi*, collected by Dr. A. Regel on the mountains of Thian-Schan, we have a pretty dwarf-habited species, with short glaucous ensiform leaves, and pale violet bordered outer petals, marked with coppery veins, and contrasting strongly with the erect inner petals, of a coppery-bronze hue. In *Iris iberica insignis* (*Gardeners' Chronicle*, xi., 693, fig. 100) we gain a much improved form of that fine species, which was selected from a batch of imported roots. A fine *Campanula*, grown in the French gardens under the name of *C. Van Houttei*, is in the way of *C. nobilis*, and has the large drooping blossoms of an indigo-blue. Strongly contrasting with this is the *Androsace Lageri*, a pretty little rock plant of the Primulaceous order, growing in tufts, the short stems having linear oval-shaped leaves, and looking not unlike those of a *Polystichum*, while the heads of little pink flowers are very abundant. The dwarf rosy-tinted *Primula rosea*, from Kashmir, is another gem belonging to the same group, as is the purple-flowered *P. cashmiriana* from the same region.

#### HARDY BULBS.

Amongst the novelties in this group we find a gem of the first water, *Chionodoxa Luciliae*, one of the most charming of spring decorative

subjects, humble in its habit, but perfectly dazzling in the brilliant blue of its starry blossoms, which rival if they do not excel those of the *Scilla sibirica*, being larger in size and at the same time fully equal to them in intensity of colouring. Novel in character but several grades lower in merit than the foregoing, though still a pretty plant and worth a place in every bulb garden, is the *Gladiolus Lemoinei*, a hybrid in which the blood of the mother, *G. purpureo-auratus*, is strongly marked; the creamy flowers are flushed with salmony-red, and handsomely blotched with maroon-crimson and orange; quite different from those in the ordinary *Gladioli*, and quite hardy, having stood in the open ground uninjured for the past two or three winters. There are two new American *Lilies* of the affinity of *L. canadense*, with pendant bell-shaped flowers: *L. maritimum*, with deep orange-brown flowers spotted with dark purple; and *L. lucidum*, with translucent light orange-yellow flowers and dark purple spots inside. Sundry new *Tulips* have been obtained from Central Asia, of which none are perhaps so striking as the spotted-leaved *T. Greigi*, introduced a year or two ago, but some are very interesting, as *T. Schrenkii*, which resembles *T. Gesneriana*, the parent of our garden *Tulips*, but is smaller and more funnel-shaped, the colour crimson with a yellow base; *T. Kesselringi*, which has the same relationship, and is also small-flowered by comparison, the outer segments being yellow streaked outside with purple, the inner whitish towards the tips; and *T. Kolpakowskiana*, also a pretty species, already affording sundry varieties of colour. To these may be added a rather good-looking *Fritillary*, namely, *F. Burnatti*, which belongs to the same set as our native *F. meleagris*, and is much like it in marking, only the colours are richer, being a deep lurid brownish-red closely tessellated with white, especially on the inside, the outer surface having a glaucous bloom.

#### HARDY ANNUALS.

The *Chorispora Greigi*, found by Dr. A. Regel in Thian-Schan, in Central Asia, is a very pretty but simple-looking cruciferous annual (or biennial) with pinnatifid leaves and erect racemes of purplish flowers somewhat like those of a *Virginian Stock*, the seed-pods of which are prettily torulose; it may possibly become a rival to the popular annual just alluded to if it proves equally amenable to cultivation. In the Californian *Erythraea venusta* we have a charming little plant of 8 to 10 inches high, with the dichotomous branching of the genus, and showy star-shaped rosy-scarlet flowers. *Nemesia cynanchifolia* (*Gardeners' Chronicle*, xii., 136, fig. 22) is a showy *Scrophulariad* from Natal, growing some 1½ or 2 feet high, with close terminal clusters of rich lilac-blue flowers. The additions here are few, but they are all interesting plants in their particular group. *T. Moore*.

(To be continued.)

### New Garden Plants.

#### CELOGYNE BARBATA, Griff.

*Tandem aliquando!* How long have we had to sigh for this beauty, growing on Anglo-Indian ground and lurking in our herbaria for more than a quarter of a century, having been discovered by one of the very best and keenest of English botanists, Dr. William Griffith. There they lie, two mighty inflorescences, the one with a peduncle more than 2 feet long, strong, rigid, with eight stiff imbricate brown scales under the inflorescence, thus showing the plant to belong to Dr. Lindley's section, *Imbricateae*. The inflorescence bears ten flowers, which might be compared to those of *Ceologyne elata* (though they are much larger), if it were not for the glorious labellum which is trifid with projecting triangular acute middle lacinia, three rows of narrow lamellae on the disk, and a border of ciliae. These lamellae, those ciliae, and the top are altogether of a sepia-brown verging to black, which gives an exceedingly neat contrast to the beautiful white colour of the other parts

of the flowers. The upper part of the column is hooded, and there is a toothletted membrane around the anther. The stigmatic hollow is transverse under the very broad projecting rostellum.

To the credit of the collections of Burford Lodge, and High Cross, Tottenham, it may be said that the internodes between the flowers are shorter than in the wild specimens, and not one of the fourteen wild specimens has so many flowers as the glorious Burfordian raceme. Perhaps in consequence of this the individual flowers are smaller than in Mr. Day's splendid but few-flowered inflorescences. I have a letter of Thomas Lobb himself (kindly presented by Messrs. Veitch), who says, "flowers must shrink in drying, as is always the case with *Orchids*." Now those shrunken flowers are larger than those of my fresh many-flowered peduncles. I must also state that the zigzag bends of the inflorescence are much less apparent in the garden plant than in the wild one.

A good orchidist should have a microscope (of course a compound one) to increase his enjoyment and to astonish his profane guests in the drawing-room before dinner. This plant offers much interest in the ciliae and lamellae as seen under the microscope, as they have numerous projecting conical teeth, making a wonderful appearance; all those organs belonging to De Bary's "Zotten" (see his invaluable *Vergleichende Anatomie*: Leipzig, 1877). Then the tela conductrix of the stigmatic hollow is unrivalled in the multitude of shapes assumed by the cells. Unger mentioned as an inexhaustible store of various kinds of cells the fruit of *Eleagnus* (even mentioning the forms of biscuit cell, and the bagpipe cell!), we may cite the biscuit cells and numerous other kinds in our *Ceologyne*, though, I am sorry to say, there are no bagpipe cells. Dr. Lindley gave a very good description of the plant in his *Folia*, which is very Lindleyan in saying all that was wanted in as few words as possible. His censure of Dr. Griffith's figure is a little hard, though not quite undeserved. We must bear in mind that the faults—and faults there are—are decidedly not due to our lamented hero, but to Mr. McLelland and his would-be lithographers.

My specimens come from Bootan, Griffith! Khasia Hills, Lobb! Dr. Hooker and Dr. Thomson! Mann! A memorandum from this excellent friend states that it flowers in November, at the height of 3000 to 4000 feet! I must also state that I have some specimens (once the property of the Horticultural Society), signed "Malacca, Griffith." This appears to be a great mistake.

Dr. Lindley calls the bulbs "sub-ampullaceis" (see *Folia*). This is quite true for my single specimen of Hooker-Thomsonian origin; but my other specimens have a different shape of bulb, which are almost sessile at the base, hence conical, and not swelling out in the middle.

I was told by my English acquaintances that the specimens require a continuous and abundant supply of water while growing. I have to express my warmest thanks for these glorious inflorescences to Sir Trevor Lawrence, for the first, and to Mr. John Day, for the second. What a pity the beauty did not flower in Dr. Lindley's days, who called it "perhaps the finest of this fine genus." I believe the introduction is due to Mr. W. Bull, for whom it was collected by Mr. Freeman. *H. G. Rehb. f.*

#### ABIES LASIOCARPA.

FOR the photograph of the beautiful specimen engraved at fig. 1, p. 9, we are indebted to Allesley Boughton Leigh, Esq., of Brownover Hall, Rugby. The height of the tree is 13 feet; the girth of the stem, at 3 feet from the ground, 17 inches. Its weeping habit renders it unusually elegant. The small spray sent to us was very like one of *A. grandis*, but the leaves were paler, on which account we think it not unlikely that the plant is really a form of *A. concolor*. Balfour's *lasiocarpa* is generally admitted to be the same as *grandis*; while, according to Dr. Engelmann, the *lasiocarpa* of the nurseries is a young state of *A. concolor* which has not as yet produced cones. *A. concolor* on the same authority includes as synonyms *Lowiana* (Gordon), *Parsonsiana* (hort. Barron), and *amabilis*. *A. concolor* has, as its name implies, no, or but slight, difference in colour between the upper and the lower surface of the leaf, while all the forms of *grandis* have the upper surface of the leaf of a darker green than the lower. British Columbia and Northern California are given as the localities of both these species.

BARB FENCES.—The *American Agriculturist* gives figures of various wire fences, with formidable barbs at intervals, so that the fence has all the impenetrability of a quickset hedge without the loss of time in growth, and the numerous evils connected with hedges.

COTTAGE GARDENS.

ONE day during one of my autumnal rambles I was walking along a pleasant road in Derbyshire, making towards Darley Dale and the lovely rock gardens of Sir Joseph Whitworth, at Stancliff, where Art has been summoned to the aid of Nature, and disused stone quarries have been transformed as by the magician's wand into things of beauty, which I trust may continue "joys for ever."

tage had windows on both sides of the door, and a small narrow plot before each running from the cottage to the road, from which it was separated by a low fence of rustic palings of split Larch with the bark on.

The total area of this plot was small, and though not an inch of it was unoccupied, there was no over-crowding. The brightness of the flowers lit up the front of that cottage to such a degree that no one with eyes could pass it without having his atten-

bore testimony to industry, well-directed labour, and never-ceasing love for the gentlest of human pursuits.

A few years passed by ere I was in that neighbourhood again. I made a journey to my pet cottage on the first opportunity; but, alas! what a different sight awaited me! The bright flowers were all gone; the neat brightly furnished garden had lost all its distinctiveness; the climbers on the house were either dead or dying; the vegetable garden was mostly occupied by weeds; all was as miserable and forlorn

FIG. 1.—ABIES LASIOCARPA (? CONCOLOR) AT BROWNSOVER HALL. (SEE P. 8.)

During the greater part of my walk I saw nothing of much interest except the natural beauties of the surrounding scenery. They, however, were ample for my delight, and I wandered on, well content to be in the midst of so much that was lovely. I had nearly reached the limits of my walk when I came upon a small, decently-kept cottage, apparently occupied by some gentleman's servant (I afterwards found it was a coachman's cottage), with a small garden in front and on one side, which was absolutely perfect as an instance of good cultivation. The cot-

tion arrested, and the more it was examined the more there was found to admire.

The cottage itself was covered with a Gloire de Dijon Rose, two kinds of Clematis, and a Japanese Honeysuckle, except at the extreme limits at both ends, where a small-leaved digitate Ivy, trained closely to the wall, acted as the sides of a green-frame to the other plants. The garden at the side of the cottage was filled with excellent vegetables; not a bit of it but was bearing a useful crop. There was no sign of untidyness or neglect anywhere; the whole

as could be. The former tenant of the cottage was gone elsewhere, and had been followed in the occupation by an idle fellow on whom the lesson of that sweetly pretty garden was thrown away, and a spot of brightness and beauty was transformed into one of ugliness, disorder, and neglect. I left the spot saddened, and felt that the world was all the poorer for the loss of what was once so comely and beautiful.

Another of my autumn holidays was passed in Dorsetshire. I started one morning for a walk from Weymouth to Maiden Castle, and thence to Dor-

chester. During my ramble I passed through a village which has ever since lived in my memory as an especially bright spot. The cottages were mostly low in height and grey in colour; the roofs were uniformly made of thatch, and however different in appearance, were all more or less picturesque. Vines were trained over the cottage fronts, or on the gables when they chanced to have the sunniest aspect. Every cottage had its garden, and all were bright with flowers, while in many, besides the vegetables, which were everywhere in plenty, there were heavily laden fruit trees, Apples, Pears, and Plums, adding to the value and beauty of the gardens. I have never had the chance since of ascertaining as a fact the reason for the uniform excellence and universality of gardening in that village; but doubtless it was due to the all-pervading influence of some good and wise man or woman, who by example and precept had set the villagers on a path of a useful and refining tendency. Not improbably the Vicar of the parish was the cause; for I have usually found that wherever a village is famed for its gardens, the parish priest is also a gardener, and fosters the pursuit among all within the range of his influence.

A striking instance of a clergyman's power to make his parishioners good gardeners is afforded by a parish in Staffordshire, not far from the borough boundaries of a large town in an adjoining county. The villagers are a mixed community as to occupation, some being farm labourers, others workers in the mills and forges near at hand, or skilled artisans of one kind or other. Before the advent of the present Vicar the village was just like hundreds of others similarly situated. Being mainly built on land belonging to a neighbouring nobleman, the cottages were good and substantial; some of them picturesque and pretty; all having gardens, which were generally cultivated in the manner usually prevailing. Somewhere about Good Friday signs of activity were seen in them. The rows of Kidney-Bean sticks remaining from the last year were then removed; spades were once more brought into use, and the soil, which had remained untouched from the previous spring, was dug, seeds sown, Potatos dibbled in, and Cabbage-plants placed in the rows. Here and there a few flowers were to be seen. It was, as will be inferred, an ordinary common-place village. All is now changed, as it has been for years past. The present Vicar, while unremitting in the performance of his duties as a parson, as they are usually understood, is a living influence in many other ways, but in none more marked and visible than as the chief gardener of the district. He is himself a most skillful cultivator; he has made all his humble parishioners scarcely less so. He commenced quietly, but none the less effectually. He instituted social gatherings of his people long before the days of penny readings. He chatted with them on a variety of topics, and amongst others on the subject of gardening. Having awakened an interest, he fanned it by judicious presents of seeds, cuttings, plants, &c.; now and then a Rose tree, a few flower-roots, or some tubers of a good sort of Potato. Before long some one suggested the holding of a village show of vegetables; this the next year grew in proportion, and included fruit and flowers. For a time it was limited to the cottagers, but as years rolled on the neighbouring gentry sent in plants to add to the interest of the show, and now there is a flourishing and admirable horticultural society, distributing annually a goodly sum in prizes. And what tale do the village gardens tell? Why there is now to be seen, in this once commonplace village, as fine a lot of well-tilled gardens as can be seen anywhere. Roses abound in them; fruit trees are to be seen in every plot, and the houses are covered with beauty-giving climbers. Truly the Vicar has been an influence for good, and his cottagers are living instances of his beneficent reign. May it long continue, and may his example be followed in every parish in the kingdom!

Now for a contrasting picture. I pass from the centre of England far northwards. I am in one of the lovely dales of the Lake country. I shall never forget my delight when I first saw it. It is out of the line along which the bulk of summer tourists usually travel. It is surrounded on all sides by magnificent mountain scenery. Down its centre runs a merry beck. Not far from it is a glorious lake. I was out of health when I went there, and had lodgings, which a friend in the neighbourhood had taken for me, in a quaint old-fashioned dalesman's farm, where I found myself surrounded by conditions altogether unlike

those of my ordinary life. I look back on my quiet leisurely life there with regret, and often wish myself back among the lovely scenery of that quiet dale. My first visitor was the "fell-side priest," as the parson is called. A fine specimen of a robust, vigorous-minded man, I found him. Chatting on one subject or another, I asked him, "What about gardening?" "Oh," he replied, "the farmers don't do much that way; they are too busy with the sheep, or in the fields." I soon found this to be so. With the exception of the parson's garden there was not even an approach to a decent garden in the whole dale. The pieces of ground called gardens, attached to the houses, I found to be the worst cultivated plots in the holdings. A few badly grown Cabbages, of a degree of badness new to my experience; a few herbs, occasionally a row or two of indifferent Peas, and fairly good Potatos, were all I saw. And yet the climate was good; the soil not by any means bad. I inquired, "Could not these men be induced to pay more attention to their gardens?" "No," was the never-failing reply. I suggested that an attempt should be made. "It's no use," said my clerical friend.

But I maintained, in many a talk that followed, if he would but take the lead, and set the example, a great change might be effected. The parson, however, was not to be moved; and when I came away from that pleasant spot I felt as I have never failed to do ever since—that if the Staffordshire clergyman of whom I have spoken had been living in that dale, his influence would soon have been felt, and the charms of pleasant, profitable gardens would have been added to the many natural charms of that lovely spot. E. H.

PLANT PORTRAITS.

ORYTHIA OXYPETALA, Kunth, *Gartenflora*, t. 987, f. 2.—A yellow-flowered Tulip, the outer surface of the outer perianth segments being green. The stalk bears two green glabrous leaves. It only differs from Tulipa in the presence of a style. Native of the mountains of the Southern Altai, whence it has been introduced by Mr. Alfred Regel.

PAPAYA GRACILIS, Regel, *Gartenflora*, t. 986.—A slender unbranched tree, 4–6 feet high, with 3–5 partite leaves, whose lobes are again divided; flowers funnel-shaped in terminal cymes. New Granada. Introduced by M. Linden.

PEAR CHARLES ERNEST, *Revue Horticole*, Nov. 1.—Highly spoken of as a very fruitful new Pear; fruit large, pyriform, turbinate, oblique at the base, peduncle short, stout; eye shallow; skin sulphur-yellow, spotted with fawn-coloured spots, and blotched with crimson on the sunny side; flesh white, melting, flavour delicate. November–December. Raised by MM. Baltet, of Troyes.

SAXIFRAGA GERANIODES, L., *Gartenflora*, t. 989.—A Pyrenean species, with the habit of *S. granulata*.

TILLANDSIA TRICOLOR, Schlecht. and Cham., *Belg. Hort.*, 1879, t. xxi.—Bromeliaceæ. A handsome Mexican species, with tufted habit, narrow arching leaves, which on the flowering-stem become rose-coloured; spike compound, flattened; bracts green; flowers purplish, white at the tips.

TEMPERATURE AND VEGETATION.

DR. STAUB, of Buda-Pesth, has been following up the observations of De Candolle and others on the influence of "sums of temperature" on the leafing and flowering of various trees. We are indebted to the *Botanische Zeitung* for the following particulars, which are of special interest in relation to forcing. Dr. Staub's deductions, we may mention, were made from a large number of observations in various parts of Hungary. One of the most striking results obtained was the exceeding susceptibility of plants in relation to the changeableness of climatal factors, especially of temperature. This peculiarity becomes even more prominent on a closer examination of the observations of several years at the various stations. Comparing, for example, on the one hand, the monthly mean of the temperature of one year's observations with the monthly mean of several years' observations, and on the other hand, the deviations in the commencement of the flowering period in the months for single years with the general mean of the flowering period (as may also be determined by the observations of several years), we recognise the following

phenomena. The flowering period is only hastened when the mean temperature for the month in question is 3.5 Fahr. higher than the mean of several years; a smaller augmentation of the temperature does not affect vegetation. An exception to this law occurs when the temperature of the preceding month or months is above the average mean; for in such a case vegetation is under the influence of the secondary effects of temperature. The smallest fall in the average mean temperature of the month entails a corresponding retardation of the flowering period, and the retardation is all the greater the more the temperature of the preceding months has been below the average mean. Should the mean temperature of the preceding months be higher than the average, the lower temperature of the one month is unable to hinder the development of vegetation. Some other peculiarities observed by Dr. Staub, or those who have co-operated with him, are interesting. Thus the large-leaved Lime, according to ten or more years' observation in several places, always flowers some days before the small-leaved. In one place it is a week later, and in another upwards of a fortnight. Dr. Weszelowsky has noted that *Colchicum autumnale* has flowered twice every year at Arva-Váralja ever since 1874. The white-flowered varieties of *Syringa vulgaris* and *Nerium Oleander* always come into blossom under the same conditions at Buda-Pesth, earlier than the typical red-flowered varieties. From a geographical standpoint the thermal constants certainly offer a useful basis. Dr. Staub had observed the flowering of 128 plants for five years, and recorded the daily mean temperature from January 1 to the day the first flower opened of its species, and from these sums he calculated the mean for five years. As an example, we give the dates of flowering and the sums of heat, in degrees Centigrade, for the Horse Chestnut:—

	First Flowers Opened.	Heat Required.
1871 ..	April 26	514.31 C.
1872 ..	" 15	432.78 C.
1873 ..	" 9	460.83 C.
1874 ..	" 24	514.20 C.
1875 ..	May 9	470.20 C.
Mean ..	April 27	Mean .. 506 C.

Comparing, for woody plants, Dr. Staub states, the calculated sums of heat of each year, with the commencement of the flowering period, we involuntarily come to the conclusion that the expansion of their flowers is bound up with the season—that is to say, woody plants in their struggle with the climatal factors strive to keep within the limits of a certain flowering season to which they have become accustomed during generations. In relation to this there is a characteristic mean temperature for a certain period, say from the beginning of the month in question preceding the appearance of the flowers. Thus, according to five years' observation at Buda Pesth, it amounts to +11.5 C. for the Horse Chestnut, with a mean error of  $\pm 1.836$  C.

The accompanying table includes five examples for the period named:—

	Average date of flowering or coming into flower.	After using an average amount of heat of—	With a mean daily temperature of—	The average error being—
<i>E-culus hippocastanum</i> ..	April 27	479.70 C.	11.5 C.	$\pm 1.836$ C.
<i>Convallaria majalis</i> ..	April 25	506.00 C.	11.6 C.	$\pm 1.430$ C.
<i>Ligustrum vulgare</i> ..	June 6	1135.00 C.	19.0 C.	$\pm 3.820$ C.
<i>Prunus spinosa</i> ..	April 11	339.80 C.	9.9 C.	$\pm 2.168$ C.
<i>Vitis vinifera</i> ..	June 6	1120.20 C.	19.9 C.	$\pm 2.741$ C.

THE NEW ZEALAND FLAX.\*

THE acclimatisation of foreign plants in this country is a subject of so much general interest, whether as regards their economic value or as ornamental additions to our gardens, that I have put together the following notes on the result of a late attempt to introduce the *Phormium tenax*, or New Zealand Flax Lily, into the Orkney Islands, which islands, from their high latitude—59° north—enjoy comparatively

\* "On the Growth of the New Zealand Flax Plant (*Phormium tenax*) in the Orkney Islands." A paper read by Dr. W. Traill, at the December (1879) meeting of the Botanical Society of Edinburgh.

little heat in summer, though their winters are remarkably mild, there being little snow and frost, which is perhaps partly attributable to their insular position, but is chiefly caused by the action of the Gulf Stream, which makes its presence felt, not only by raising the temperature of the sea 7° above that of the air in the months of December and January, but by frequently casting up seeds of tropical plants on the shores of the different islands. During the severe gales of wind that often occur, there is usually a good deal of salt in the atmosphere, hence the extreme difficulty of growing trees or even shrubs, although there are a few exceptional plants that do not seem to be much affected by this, such as different kinds of evergreen shrubby Veronicas, and a few other plants, such as the New Zealand Manuka or Captain Cook's Tea-plant (*Leptospermum scoparium*), the *Pernettya mucronata*, and the Japan *Euonymus*, &c., which, favoured by the mildness of the winters, thrive remarkably well, and to all appearance the New Zealand Flax Lily is likely to prove as well adapted to the climate of Orkney as any of them.

About eight years ago or rather more I got some of the seeds from a friend in New Zealand, which I raised in a hotbed in St. Andrews, and during the same season I planted out several of them in the open air in my garden at North Ronaldshay, Orkney, where they have remained ever since with no protection beyond the proximity of a low wall, some having a southern exposure and others an eastern aspect. These plants seem in no way affected by the winter except that the tips of their leaves become somewhat frayed and ragged, but in the course of the following summer they soon recover their beauty, and they have gradually increased in size until the leaves on some plants now measure from 5 to 6 feet, and in others from 6 to 7 feet long.

I had also distributed duplicate plants among friends in the neighbourhood, in whose gardens they appear quite healthy. It was not until the first week of June this year that my plants showed any signs of flowering, but I then observed that (of the three largest plants) two were throwing out each two flower-shoots; the third and largest plant, however, produced no fewer than five flower-stalks, enveloped by long sheathing leaves that closely embraced the stems, which were at this time from 4 to 5 feet high; the upper part, which evidently contained the future flower, being inflated, and tapering to a point at the apex, not unlike the head of a spear. They increased in length at the rate of about an inch a day; the swollen mass of spathes separating, successively unfolding, revealing numerous bunches of flower-buds, until when the stem reached the length of 8 to 9 feet, there were twelve or fourteen distinct clusters of flower-buds of a purplish-brown colour, disposed alternately on each side of the stem. The spathes at this stage added much to the effect, their interior being of a deep orange colour. Our weather had been rather dry for some time, which seemed to retard the opening of the buds; but after a heavy shower of rain on August 1 the buds rapidly increased in size, and in three or four days the first flowers opened; they were tubular in shape, 1½ or 2 inches in length, of a deep red colour, with projecting orange stamens. The odour of the flowers was powerful, like that of Russia leather. It seemed to be very attractive to bees, moths, and other insects. Each main stem bore at least 300 flowers. Altogether it is a most magnificent example of the Lily family, and the general appearance of the plant is highly suggestive of tropical vegetation. It is well known that the fibre of the leaves possesses extraordinary tenacity, though, from its containing a large quantity of silica in its composition, the economic value of the plant has hitherto fallen short of what was at first expected. For the manufacture of ropes and cordage, however, I should think it most valuable. The leaf, even in its natural state, is so strong and pliable, that I have seen strips of it torn off and used as boot-laces, and it is evident that the flower-stalks partake of the same tough character as the leaves, as they were not at all damaged by the equinoctial gales of last September, though they were not tied to sticks or otherwise secured from injury. I may add that the flowers, after lasting for some two months, were succeeded by numerous seed capsules containing apparently well ripened seeds. I understand that two other plants from the same batch of seeds have also flowered this season; one at Strathkinness, here, and another at Professor Swan's residence on the west coast. It is curious that they should all flower in the eighth year

of their age, but whether the phenomenon is attributable to that entirely, or to any peculiarity in the past season, time alone can determine.

MR. FORTUNE'S INTRODUCTIONS.

I HAVE the pleasure to enclose to you a list of the trees, shrubs, and herbaceous plants discovered and introduced by me during my travels in China and Japan. They are described as follows, namely, 1st, Chinese plants discovered and introduced by me while in the service of the Horticultural Society of London from 1843 to 1846; 2d, Chinese plants discovered and introduced by me on my own account; and 3d, Japanese plants discovered and introduced by me, also on my own account. Most of these have proved perfectly hardy in the climate of England, and I hope will long continue to adorn our gardens and pleasure-grounds.

May I hope the list will prove interesting to the readers of the *Gardeners' Chronicle*. There may be some omissions, as it is somewhat difficult to get a complete list after so many years. The names are those under which the plants were originally introduced:—

CHINESE PLANTS DISCOVERED BY ROBERT FORTUNE WHILE IN THE SERVICE OF THE HORTICULTURAL SOCIETY OF LONDON, FROM 1843 TO 1846.

<i>Trees.</i>	
<i>Abies Kämpferi</i>	<i>Chamaerops Fortunei</i>
<i>Cephalotaxus Fortunei</i> (male and female)	<i>Cryptomeria japonica</i>
<i>Shrubs.</i>	
<i>Abelia rupestris</i>	<i>Jasminum nudiflorum</i>
<i>Akebia quinata</i>	<i>Kumquat (Citrus japonica)</i>
<i>Azalea obtusa</i>	<i>Mandarin Orange</i>
" ovata	<i>Pearus sinensis fl. pl. albo</i>
" squamata and other spring	<i>Rose (fine coloured)</i>
" variegated kinds	" <i>Anemone-flowered</i>
<i>Berberis Fortunei</i>	" <i>yellow (Fortune's)</i>
<i>Daphne Fortunei</i>	<i>Rhynchospermum jasminoides</i>
<i>Edgeworthia chrysantha</i>	<i>Spathoglottis Fortunei</i>
<i>Fingered Citron</i>	<i>Shanghai Peach</i>
<i>Forsythia viridissima</i>	<i>Spiraea prunifolia flore-pleno</i>
<i>Gardenia florida Fortunei</i>	<i>Viburnum macrocephalum</i>
<i>Glycine sinensis alba</i>	" <i>plicatum</i>
<i>Indigofera decora</i>	<i>Weigela rosea</i>
<i>Herbaceous Plants.</i>	
<i>Adonia versicolor</i>	<i>Platycodon grandiflorum</i>
<i>Anemone japonica</i>	" <i>album</i>
<i>Arundina sinensis</i>	<i>Paeonia (a large number)</i>
<i>Calistegia pubescens</i>	<i>Lycopodium caesium</i>
<i>Chirita sinensis</i>	" <i>Wildenovii</i>
<i>Chrysanthemum (Chusan Daisy)</i>	<i>Shantung Cabbage</i>
<i>Dielytra spectabilis</i>	<i>Staticia Fortunei</i>

CHINESE PLANTS DISCOVERED AND INTRODUCED BY ROBERT FORTUNE.

<i>Trees.</i>	
<i>Abies jezoensis</i>	<i>Olea fraxinus, a fine copper-coloured flowered kind</i>
<i>Cupressus funebris</i>	<i>Quercus sinensis</i>
<i>Peach (double red) and others</i>	<i>Torreya grandis</i>
" <i>Carnation flowered</i>	
<i>Pinus Bungeana</i>	
<i>Shrubs.</i>	
<i>Abelia uniflora</i>	<i>Camellia reticulata fl. pl.</i>
<i>Bambusa Fortunei variegata</i>	<i>Clematis lanuginosa</i>
<i>Berberis Bealei</i>	<i>Ilex cornuta</i>
" <i>consanguinea</i>	<i>Lonicera fragrantissima</i>
" <i>japonica</i>	<i>Prunus triloba</i>
" <i>triflora</i>	<i>Rose Fortunei</i>
<i>Camellia Cup of Beauty</i>	<i>Skimmia japonica</i>
" <i>Prince Frederick William</i>	<i>Spiraea callosa</i>
<i>Herbaceous Plants.</i>	
<i>Campanula nobilis</i>	<i>Moutan Peony (thirty vars.)</i>
<i>Farfugium grande</i>	" <i>stock for grafting</i>
<i>Ferns (many species)</i>	

JAPANESE PLANTS DISCOVERED AND INTRODUCED BY ROBERT FORTUNE.

<i>Trees.</i>	
<i>Acers (many species)</i>	<i>Osmanthus variegatun</i>
<i>Corylopsis parviflora</i>	" <i>nanum</i>
" <i>spicata</i>	<i>Pitiosporum variegatum</i>
<i>Cryptomeria sp. nov.</i>	<i>Retinospora aurea</i>
<i>Elaeagnus variegata</i>	" <i>obtusata</i>
<i>Sciadopitys verticillata</i>	" <i>pisifera</i>
<i>Ligustrum japonicum aureo-variegatum</i>	<i>Thujiopsis delabrata variegata</i>
<i>Osmanthus Aquifolium</i>	" <i>Standishii</i>
<i>Shrubs.</i>	
<i>Aralia variegata</i>	<i>Euonymus of sorts (many very beautiful)</i>
<i>Aucuba japonica (male)</i>	<i>Keria japonica variegata</i>
" <i>vera</i>	<i>Lonicera aureo-reticulata</i>
" <i>limbata</i>	<i>Podocarpus (many kinds beautifully variegated)</i>
" <i>narrow-leaved</i> and	<i>Prunus japonica</i>
" <i>others</i>	<i>Raphiolepis ovata</i>
<i>Clematis Fortunei</i>	<i>Skimmia japonica (vera)</i>
" <i>John Gould Veitch</i>	" <i>nova, and some others</i>
" <i>Standishii</i>	<i>Thea viridis variegata</i>
<i>Daphne variegata</i>	<i>Yedo Vine</i>
<i>Deutzia crenata fl. pl.</i>	
<i>Eurya sp.</i>	
" <i>japonica variegata</i>	
<i>Herbaceous Plants and Bulbs.</i>	
<i>Chrysanthemums of sorts (the Japanese kinds)</i>	<i>Rhododendron Metternichii</i>
<i>Convallaria variegata</i>	<i>Rhaphis flabelliformis variegata</i>
<i>Lastrea Standishii</i>	<i>Saxifraga Fortunei</i>
<i>Lilium auratum and others</i>	<i>Spiraea palmata</i>
<i>Lychnis Senno and variegata</i>	<i>Tricyrtis sp. (thirta)</i>

Robert Fortune.

NEW FRUITS AND VEGETABLES OF 1879.

A VEIL might well be drawn over the past year in respect of new fruits, for never have we had to record such a disastrous season for fruit crops in general as that of 1879. The cold wet spring played sad havoc with the fruit blossoms, and prevented their setting, and the continued cold, wet, sunless summer, extending to the very end of the season, entirely destroyed the true character and quality of the outdoor fruit crop in this country. No open-air grown fruit of any kind, it may be safely stated, reached its average quality or character during the past season. It would, therefore, be manifestly unfair to gauge the merits or demerits of new introductions by the experience of such a season. Better by far would it be to blot it out, and wait for brighter prospects to come.

The inclement character of the season was very fitly illustrated by some of our commonest and hardiest of fruits. The Hessel Pear, for example—one of the very hardiest sorts grown—although a full crop in almost every part of the country, never attained much more than half its natural size, and was almost uneatable. Louise Bonne of Jersey, usually one of the most reliable, was one of the very worst.

Messrs. Ewing bring forward the Norwich Prolific Nut as a new and distinct variety. It bears a close resemblance to the Atlas Nut, and wants careful comparison with that variety.

Coming to fruits grown under glass—although these were to some extent protected from the immediate climatal influences, they suffered from the absence of solar heat, resulting in a loss of flavour, the most noticeable new variety that came before us being a very handsome black Grape, from Mr. Allen, of Gunton Hall. This is a cross between Syrian and Alicante, and promises to become a useful variety. New Melons form a triplet—one of the finest, a large green-skinned sort, resembling the old Egyptian green-flesh, being named after that good old gardener, William Tillery. We hope it may prove a worthy memento of a worthy man. Mr. Carmichael's Victory of Bristol is a very fine, free-fruited, good sort, and the same may be said of the Davenham Early. We go no further this season.

VEGETABLES have been also injuriously affected by the inclemency of the past season—not perhaps to such an extent as fruit, but very greatly so, and sufficient in many cases to render all comparative tests as to special merits nugatory. In light soils many vegetables succeeded fairly well, but on heavy lands the failure was melancholy. Seeds during the present season cannot but be scarce and unsatisfactory.

Peas, in most cases, where they grew at all, were remarkably good. Carter's Telephone and Culverwell's Telegraph—the former a wrinkled selection of the latter—proved well, and maintained the high character awarded to them the previous year; and Mr. Culverwell is to be congratulated as the raiser of two such meritorious Peas. But yet another giant comes to us from the same source, named Autumn Marrow. This is an extraordinarily large-podded Pea, excellent for autumn use and splendid for exhibition purposes. Carter's Stratagem, a dwarf wrinkled blue marrow, is a grand acquisition—a heavy cropper, with large, remarkably well-filled pods. This will, no doubt, be largely grown for market purposes. Big Peas being the fashion, Messrs. Veitch are at last to give us Laxton's The Baron, a monster variety, grown at Chiswick in 1873, but only now sent out.

Amongst Kidney Beans a very desirable variety will be found in Messrs. Hurst's New Mammoth Negro, having fine long pods like Canadian Wonder. Of Turnips Benary's Early Munich is very valuable for its earliness, coming into use three weeks in advance of the earliest varieties. Amongst Radishes, a very extensive and excellent trial of which was made by the Fruit Committee at Chiswick, the earliest and finest stock proved to be the Early Rose Globe (Rond Rose Hâtif) of Leroy. This is a rose-coloured variety, intermediate in form between the Turnip and Olive-shaped sorts. The Earliest Red Erfurt short-top white Turnip Radishes may also be mentioned as very desirable varieties for forcing, being very early and with very small tops. Of Lettuces Messrs. Webb speak of Summerfield Giant, a variety of the Drum-head Cabbage.

New Potatoes have not been quite so prominent during the past year, the capability of resisting disease seeming to have been the chief desideratum. Two varieties have come prominently forward in thi-

garb—Magnum Bonum and Scotch Champion. The latter lays claim to some novelty. Although already grown to a very great extent it is comparatively new, and only last month received a certificate from the Royal Horticultural Society. It comes from Forfarshire, and is intermediate between the Regent and Irish Rock. Although by no means a handsome Potato, it is one of fine quality and a most satisfactory cropper. Amongst newer varieties may be mentioned Cosmopolitan and Avalanche, smooth white kidney varieties of great promise; also McKinlay's Beckenham Beauty, Vicar of Laleham, and Davis' Model Seedling, a very handsome variety, exhibited by Mr. Perry at Birmingham.

Let us hope that the coming year may prove more kindly disposed.

### LITTLE ASTON HALL.

THE residence of the Hon. E. S. Parker-Jervis, is near to Sutton Coldfield and Birmingham, and since the formation of the new branch of the Midland Railway, running from Birmingham to Walsall and Wolverhampton, is easily reached from Streetly Station. Although within a short distance of the Black Country—in fact, on the border of it—Little Aston Hall (see p. 17) nestles in a beautiful and well-wooded district, and the mansion, a noble structure, does full justice to the handsome and spacious park in which so many grand old specimens of Beech, Oaks, and other trees abound. The Beeches especially are perfectly at home here, attaining a great size and perfect luxuriance of growth, and are very numerous. In a stroll through the park I obtained the measurement of one fine patriarch, which has a girth of 15 feet at 4 feet from the ground, and it must be borne in mind that this is in the Black Country district.

The lawn at the garden front of the house is extensive and admirably kept, the standard pyramidal Yews and Hollies in pairs, alternating down the broad walk leading to the ornamental water, forming a very pleasing feature, as they are in good condition and are well looked after. Betwixt these specimen evergreens are ten long beds in pairs, each bed requiring 1000 bedding and edging plants, and as several other large beds exist in the pleasure grounds, and nooks and corners have to be filled, besides a great number of balcony and window work about the mansion to be supplied, a large stock of bedding plants has to be kept up.

In a conservatory—one of the old-fashioned structures such as were very common some forty or more years since—is a fine old tree of the *Rosa indica odorata*, planted fully thirty years ago, and which must be one of the oldest examples of this long since popular variety to be found in England. In the pleasure grounds about the mansion are noble specimen trees of *Ailantus glandulosa*, Tulip tree, Beech, some grand old Scotch and Larch, some rare Oaks, evergreen as well as deciduous, and a fine *Taxodium distichum*, 50 feet high, and the girth 4 feet 9 inches at 4 feet from the ground.

The pleasure grounds under the scythe and mowing machine consist of 7 acres, and the ornamental water is spacious and forms a most pleasing feature in the park scenery, the steam launch being considerably more than a toy boat.

Flower gardening is not carried out in a pretentious manner, although there is quite enough to lighten up the pleasure grounds with groups of colour. Still carpet bedding is adopted in a nicely designed garden near the conservatory, but here, as in so many other gardens this season, *Alternantheras* and *Iresines* failed, and colours had a very washed-out appearance.

The kitchen gardens are 4 acres in extent and enclosed by walls. Some capital pyramidal Pears are in good condition but bore thin crops, whilst the walls are well planted. Filberts and Cob Nuts abound, large plantations of them; and the trees were loaded with Nuts, but it is probable at the gathering of them that many were without kernels. This seems to have been the case in many places, Filberts showing the effects of so much cold, wet, unless weather.

There are several fruit and plant houses, in which, without aiming to ensure great results, Mr. William Ward contrives to grow a good lot of Grapes and other fruits, as well as plants. The gardens, like the conservatory, belong to a past generation, still Little Aston Hall well deserves a niche in the temple of fame where good gardens are enrolled. Here in a nook of the kitchen garden are several plants of

white Mediterranean Heath, which some time since were in full beauty, and how prettily it works into bouquets and table decorations!

In one of the vineries, 30 feet by 13 feet, is a fine old Black Hamburg Vine, planted fully thirty years ago, monarch of almost all it surveys, for it has the greater portion of the house to itself, and notwithstanding its age yearly gives a crop, and this season it had a capital crop of fruit, and good wood promising well for 1880. It is planted on the north side of a lean-to house, with a 6 feet border, but the roots have no doubt travelled far away. The stem was brought through a hole in the back wall at the time of planting, and of course the Vine has been trained downwards to the front of the house. A broad gravel walk exists beyond the 6 feet border.

Strawberries are extensively cultivated here for forcing; and in another vinery, containing Vines which have been planted several years, is a fine old Mill Hill Hamburg, quite thirty years old, which occupies a considerable space; some fine bunches weighing from 3 lb. to 4 lb. have been cut, and fit for the exhibition table. One bunch was 6½ lb. in weight, and in excellent character.

The practice of having a prolific supply of a substitute for forced Seakale has long existed here, and a visit to this place in the middle of December afforded ample proof of the excellence of forced Swede Turnip-tops, Mr. Ward having given us an opportunity of testing their value in a cooked form, and it would puzzle nine out of ten to detect the difference betwixt it and Seakale. The roots are gently forced in an old Mushroom-house, where the temperature is kept at an average of 60°. Like Seakale, when the forced crowns are cut out and used, a quantity of side-shoots are formed, which are equally delicious. As Swede Turnips are within the reach of all, a trial can easily be made at little or no cost, and where Seakale roots for forcing are not easily obtainable, the Seakale substitute will be welcomed. *Rambler.*

### Notices of Books.

**Sizing and Mildew in Cotton Goods.** By G. E. Davis, C. Dreyfus, and P. Holland. Manchester: Palmer and Howe.

Every now and then profane outsiders hear rumours that John Chinaman, or some other remote barbarian, has had the effrontery to complain of the goods sent out from Manchester. It is even said that the character for integrity of the British manufacturer and the British merchant has been somewhat impaired in consequence of the inferior quality of the goods supplied. We cannot say whether this is so or not—it is out of our line—but only supposing it to be so, our far off friends, did they but know it, are avenged by the existence of cankering mildew, the direct consequence of the process of "sizing" to which cotton goods are subjected. Sizing consists in washing or steeping the yarn with a size made from Wheat flour and water. This is allowed to ferment, and after some days the nitrogenous or glutenous matters are removed, and the liquid is then ready for use. Various other farinaceous substances are used, which we need not enumerate. Suffice it to say, that the object of the sizing process is not, as some might think, to give a superior appearance to an inferior article, but is, within proper limits, absolutely necessary to manufacture the fabric and to strengthen it when made. Fatty substances are also used in the manufacture to soften the yarn, while various mineral substances are specified as "weight givers!"—such are China clay, soapstone, gypsum, and Epsom salts. Other materials are used to keep the yarn moist during the weaving process, such as chloride of calcium. The simple operation of sizing (so-called by our authors) is not fraudulent unless a large excess of starchy matter be introduced—"nor is the practice necessarily open to censure even then, provided the price for a pure cloth be not charged for one containing much size. Since the weaving process cannot be conducted without a dressing of the warps, it is not fair to the weaver that all the evils which have since arisen in connection with the subject should be accounted to him as the one responsible for them." The weighting process, however, seems less defensible, and, as we have said, the sizing process brings its own retribution in the shape of various fungi or moulds. These pests do not confine their ravages to the field or to the garden—the store-cupboard, the cellar, and

the harness-room all afford them scope for their mischievous activity, and the glutenous and nitrogenous constituents of the size used in the manufacture of calico affords them just the very aliment they like best. The mischief they do in this case is twofold—they impair the strength of the fabric, and they deface it by causing unsightly spots and blemishes. No less than twenty-seven different kinds of moulds and mildews have been detected on cotton cloth, figures of which, from the pencil of Mr. Worthington Smith, are given in the volume before us. We are indebted to the publishers for the use of the blocks illustrative of these fungi, and as the list of names is so long we refer to the book itself for the catalogue of these miscreant mildews. In fig. 3, p. 13, are represented, very highly magnified, the individual fungi; in fig. 2 a portion of the woven cloth, with the fungi growing *in situ*—though we expect that the artist has taken the liberty of depicting more kinds than are ever met with at one time on a piece of cloth. At B (fig. 2) is shown a Cotton fibre looking like a twisted ribbon with thickened edges and invested by numerous minute threads, which constitute the spawn of the fungus. In consequence of these facts the authors have devoted a large space to the explanation of the mode of growth and other characteristics of fungi, including the phenomena of fermentation, and detailing numerous experiments made with a view of ascertaining the conditions under which they are produced, and the best means of preventing their growth. Chloride of zinc is one of the most efficient substances for the latter purpose, and various preparations of carbolic acid (phenol) are also very serviceable.

The remarks we have already made will suffice to convey a notion of the nature and scope of the book before us. It seems to have originated in an action brought to recover a large sum of money lost in consequence of the discoloration of the goods by a reddish brick-coloured stain, the nature of which was contested. The report of the trial is given, and it is instructive, as showing the necessity in such cases of having a jury of experts—manufacturers, chemists, and botanists—rather than a haphazard selection of gentlemen without any special knowledge of the matters in dispute.

Not so many years ago our great mycologist, in the preface to his *Introduction to Cryptogamic Botany*, thought it necessary to make what reads like an apology for the study of such minute and obscure organisms as fungi. He has lived to see the importance of the study universally recognised as a necessary preliminary to the study of the life history of man, as very essential in the study of the nature of many diseases of plants and animals, and in the investigation of the best means of preventing them; and now, from practical Manchester comes the evidence that what at one time was looked on as mere laborious trifling, mere harmless amusement, is now considered in very practical fashion—indeed from a pounds, shillings, and pence point of view.

Let some of our *cui bono* friends, who want to know what use science is in the practical business of life, peruse this little volume, and apply its lessons.

### Florists' Flowers.

**NEW FLORISTS' FLOWERS OF 1879.**—In spite of storm and wet—frost, snow, and sunless weather—with the elements in apparent array against the horticulturist, and the seasons in somewhat eccentric action—the floral records of the year are yet as numerous, full of interest, and valuable, as in any preceding year; the faculty of happy conception and the quality of enterprise, knows no diminution of zeal. The fervour shown by the florist is as praiseworthy and as full of consequence in small things as in large ones. We ought never to lose sight of the value of the simplest work in relation to the production of new forms in floriculture.

"Pay not thy praise to lofty things alone:  
The plains are everlasting as the hills!"—

is a couplet suggestive of the truest philosophy in relation to progress. The man who produces a new Verbena or a new Pansy (taking these as representing the lowest forms engaging the attention of the florist), if either be something higher in development than any that has gone before, wins as much honour as the skilful hybridiser who produces a new *Cattleya* or a distinct and splendid *Nepenthes*.

But to the task of passing in review the new floral productions of the year. What a wealth of new forms of the AMARULLIS is one part of the heritage from 1879. Since the Hon. and Rev. Wm. Herbert sketched *Hippeastrum splendens* in his preliminary treatise in 1821, what wonderful strides have been made. In point of colour, size and form we appear to have come very close to the goal of perfection, only that the ideal recedes as we approach it. Take as illustrations Dr. Masters, Duke of Connaught, Mrs. Baker, Mrs. Morgan, and Virgil, as representing the best; it seems difficult to improve upon them, only that results are co-equal with enterprise.

The AURICULA is not overlooked; it is now receiving a greater share of attention than for years past, and new forms are a certain result of an enlarged interest. Of white edges, Kead's Aeme is a

respect of *A. indica*, Williams' Duchess of Connaught is a charming and useful decorative variety, and the same estimate holds good of Van Geert's Empress of India, a very attractive double form; White Madeline is a large, pure white, semi-double variety, shown by Mr. Turner. The hardy Belgian varieties of *Azalea* exhibited from Knap Hill, and by Messrs. Veitch & Sons, and especially Graaf von Moran and *Narcissiflora*, show that this section is advancing.

Still the production of new TUBEROUS-ROOTED BEGONIAS goes on with almost flood-like persistency; and they come near to the Rose, Chrysanthemum, and Zonal Pelargonium in attracting a large share of public attention. When a dozen or more new varieties are certificated in one season, there is abundant proof of added quality. Whether we take the double varieties, which are represented by greatly improved

surprising that but a very few good new flowers came to the fore, though it must not be inferred that they do not exist. S.B. Robert Lord, C.B. J. T. D. Llewellyn, both raised by Mr. E. S. Dodwell, and P.F. G. F. Wilson (Turner), promise to make a good reputation. Picotees—H.K.E. Dr. Abercrombie (Turner), L.R.E. Violet Douglas (Simonite), L.P.E. Clara Penson (Wilmer), and Baroness Burdett Coutts (Turner), are of excellent quality, as the Certificates of Merit they received proves. A Northern Carnation named William Sporr (Adams), S.B., is said to possess excellent properties. In the way of Clove Carnations, Susan Askey (Culverwell), pure white, Heather Bell (Turner), pale pink, finely fringed, and Coroner (Barron), rosy crimson, very fine, are capital additions to this useful class. Mr. Turner's batch of new yellow

FIG. 2.—COTTON CLOTH, WITH MILDEWS GROWING OUT OF IT (MAGN.)

FIG. 3.—MILDEWS FOUND ON COTTON CLOTH (MAGN.)

charming and chaste flower, with much refinement of colour. Llewellyn's Grey Friar is a bold variety, of large size and good properties, perhaps a little too over-sized to be compatible with refinement, while Horner's Ringdove is a dark violet self, with all the qualities so well balanced as to form an approximately perfect Auricula. Mr. Turner's new alpinæ, A. F. Barron, Duchess of Connaught, Mrs. Ball, and Susie Matthams, give added lustre to this interesting class.

In regard to the AZALEAS, the new varieties of *A. indica* fall into the second place, as compared with the splendid new types of *A. mollis*. On the Continent the improvement of these fine decorative plants has been pushed on with great success, and with the addition of rare depths of colour united to size and form. Baron de Constante Rebecque, Comte de Gomer, Charles Kékulé, M. Arthur de Warelles, Ebenezer Pycke, and Isabela Van Houtte, all introduced by M. Van Houtte, are very fine indeed. In

orm in such flowers as Clovis, Comtesse H. de Choiseul, Edouard Morren, and Marie Bouchet—or the large flowered single types, as seen in J. H. Laing, Maude Churchill, Mrs. Howe, Reine Blanche, a very fine white-flowered type; Royal Standard, Souvenir de Gand, or Stanstead Rival—or the dwarf-growing forms represented by Constance Veitch, and Mrs. Arthur Potts—the headway is very satisfactory.

The beautiful Transatlantic CAMELLIAS, brought over by Mr. C. M. Hovey in the spring, are characterised by so much quality and refinement as to be valuable acquisitions. C. H. Hovey, rosy-crimson; C. M. Hovey, bright crimson; and Mrs. Hovey, pleasing fleshy pink, are the new introductions. The first and last received First-class Certificates of Merit from the Floral Committee; they are being distributed in this country by Mr. Ball.

In a season not at all adapted to show off the CARNATION and PICOTEE to the best advantage, it is not

Picotees was noticed at length on p. 537 of the last volume of the *Gardeners' Chronicle*. Of their value there can be no doubt.

Named CINERARIAS are still certificated, as Mr. James produces every year some varieties distinguished by large size, approved form, and rich colouring. Earl of Beaconsfield, Master Harold, and Mr. Bland, had the foregoing award during 1879; and the same award was made to Mrs. Joseph Grimond, a deep purple-flowered double variety of dwarf habit. The double Cinerarias, however, do not appear to be making much headway, and are only sparingly grown.

The handsomely marked COLEUSES have been strongly reinforced during the past year, their golden leaves being flamed, flushed, marbled, and pencilled with brilliant colours, such as purple, orange, crimson, pink, green, black, &c. There is great diversity combined with striking hues. Butterfly, Duchess of

Teck, Empress of Germany, Glow, Harlequin, James Barnshaw, Starlight, and Yellow Gem, from Mr. Bull's collection, are as beautiful as they are numerous; Dr. Brushfield (Lloyd), Majesticus, and Maud, raised by Mr. King, are strikingly handsome. Whether some of these new forms will retain their brilliant colouring when grown into size remains to be seen; it is to be hoped they will, as they cannot fail (with this proviso) to make most acceptable decorative and exhibition plants.

Each succeeding year the CYCLAMEN is found rising to a higher level of beauty. Take Mr. H. B. Smith's new large-flowered varieties, viz., Duke of Connaught, Picturata, Queen of the Belgians, among others, and they will be found uniting size and beauty of form with great freedom of bloom. Crimson King, very fine in colour, and Baroness Burdett Coutts, pure white, from the same raiser, are fine additions to the smaller flowered types, and so is Mr. Little's Gem. Reading Gem (Sutton & Sons) is also a very fine large-flowered variety of massive proportions and excellent form.

There has been no lack of new DAHLIAS, but, owing to the hostile character of the season, growers had poor opportunity of showing their flowers to the best advantage. The only certificated flower was Ethel Britton (Keynes & Co.), blush ground, tipped with pale reddish-purple. Triumphans, a rich purple self, and Mrs. Hodgson, rich yellow, tipped with crimson, are fine varieties by the same raisers. Messrs. Turner, Rawlings, Harris, and Smith, have new varieties also, of which we shall hear more next summer. From Germany have come some charming bouquet or Pompon Dahlias, and Mr. Turner's George Thomson is a rare yellow-flowered bedder, having all the good qualities that can well be desired in a plant used for this purpose. Mr. Cannell's Dahlia Juarezii, with its brilliant scarlet Cactus-like flowers, is the leading floral surprise of the year.

In the way of new FUCHSIAS, the varieties raised and distributed by Mr. Lye during the past year have proved valuable acquisitions, because of their excellent habit and free-blooming qualities. Beauty of Wilts (Lye), to be distributed in the coming spring, is a very fine light variety of the highest quality. Eclipse (G. Smith) is a very fine dark variety, of good habit, and very free.

Messrs. Kelway & Son have again produced some varieties of the GLADIOLUS remarkable for their superb quality, and that as many as eight varieties should be certificated is a good proof of their value. A few years must elapse before there will be sufficient stock to put them into commerce. A fine hybrid of M. Victor Lemoine's, named Hybridus Lemoinei, is of a very distinct and pleasing character.

The GLOXINIA, too, keeps pace with other flowers in the march of improvement, and some of the delicate maculated varieties are as beautiful as they are distinct. Charme de Latic (Lemoine), Yakoob Khan (Veitch), and Lady Holmesdale (Veitch), are excellent representatives of this section: while Duchess of Connaught (Veitch), and Mrs. Bause (Wills), are very fine in the section of ordinary marked types.

That Messrs. Veitch & Sons should receive something like a dozen Certificates of Merit for new HYACINTHS in one season, demonstrates that the year 1879 produced an unusual number of fine novelties. They are so good and distinct as to deserve separate mention.

The group of the new Japanese IRIS *Kæmpferi* has had distinguished additions during the past year. Messrs. Veitch & Sons have shown a select collection of very fine new forms, Charles Maries and Jersey Belle being especially noticeable; and Imperatrice, from H. J. Elwes, Esq., is a grand form also. No description can do justice to their superb beauty.

The production of new Show and Fancy PANSIES is confined mainly to Scotland, and they are rarely seen southwards in what may be termed show condition. But that there are marks of improvement is plain beyond doubt, though it manifests itself slowly. Bedding Pansies and Violas are also annually produced. Some of the varieties of the latter raised by Messrs. Downie & Laird are remarkable for good form and fine colours. Dr. Stuart, Chirnside, has also raised some useful and pleasing varieties.

A larger number than usual of new show or large-flowering PELARGONIUMS appeared in 1879. The existence of the Pelargonium Society serves as a stimulus to their production. As usual, Mr. E. B. Foster takes the lead as a raiser, and Alice, Emperor

William, Fireball, Flag Captain, Queen of Scots, Sensation, The Baron, and The Pope, received Certificates of Merit. Amethyst (Bréhaut) and Joe (Matthews) were similarly honoured. What are termed the "decorative" varieties grow in the popular esteem as they undergo improvement, and their value for market work is constantly being illustrated. Countess of Rosebery (Methven), Madame André (Jackson), Maid of Kent (Hayes), Nellie Hayes (Hayes), and Volunte National (F. Perkins), are the best of the year's production and well deserving of cultivation. In the Fancy class Mr. C. Turner can be credited with a dozen or so new varieties. Electric Light, Mrs. Milne-Howe, and Thurio had Certificates of Merit. The Zonal class shows a large augmentation, and Dr. Denny, who is not forgetful of double varieties, received certificates for Dauntless and Pioneer, both scarlet in colour, with full double flowers. In the single class this same raiser is to the fore with Allegro, Commander-in-Chief, a most useful pale scarlet bedding variety and equally fine for pots; Dudu, Horatio, Leander, and Romeo, all showing that stoutness of texture, refined form and rich colouring characteristic of Dr. Denny's flowers. Mr. Catlin has Edgar Catlin, Fanny Thorpe, and Lizzie Smith, all of fine quality. In Mrs. Henry Cox (Hayes) we get a new variegated Zonal worthy of a Certificate of Merit, the well-formed leaves being richly coloured. Mr. Bull has obtained some pretty double and single varieties of the Ivy-leaved section, and to one of the former, Gazelle, a Certificate of Merit was awarded. The same award was made to Mons. V. Lemoine for a pleasing single variety named Vicountess Cranbrook, white shaded with rosy-lilac.

New PENTSTEMONS have been produced by Messrs. Downie & Laird, Dicksons & Co., Laing, and Cannell, and the two former and Mr. Hooper have new varieties of Phloxes, early and late flowering. Pinks, both show and forcing, are found coming to the fore also.

A new gold-faced POLYANTHUS is obtained in Mr. Brockbank's John of Gaunt, a Northern flower of some promise. Mr. Ingram's Golden Gem is a useful bedding variety with yellow flowers; Prince of Orange (Dean) is the same, but of a deeper colour, very fine, and having Hoop-in-Hoop flowers. Superbus (Dean) is a very fine glossy dark variety, excellent for pot culture and exhibition purposes. The new mauve-coloured *P. aculis platypetala plena* is a good addition to our double garden Primroses; and Munro's white variety of *P. denticulata* is a desirable acquisition. Of Chinese Primroses, Mr. R. Gilbert's double variety, Earl of Beaconsfield, with its bright salmon-rose flowers, well deserved the certificate it obtained. Ruby King (Sutton & Sons) is a very fine richly coloured single variety; and the two Chiswick varieties, Chiswick Red and fimbriata rubro-violacea, have decidedly improved depths of colour.

Lovers of hardy hybrid RHODODENDRONS for forcing purposes should not overlook the claims of Mr. J. Davies' (Ormskirk) varieties. Duchess of Teck (Veitch) is another of the free greenhouse hybrids; and Mrs. Townshend, shown by the Rev. Mr. Boscawen, is a fine, pure white, of the arboreum type.

The new ROSES of the year are well reinforced by Mr. H. Bennett's hybrid Teas, which find much favour with rosarians generally; by Charles Darwin (Paul & Son), Duke of Teck (Paul & Son), and Isabella Ward (Ward.) A hybrid Tea, named Madame Alexandre Bernaix (Guillot), of a pleasing rose colour, was awarded with the afore-mentioned a Certificate of Merit. Of new Continental varieties there is, as usual, a formidable list, which require a season's culture to afford an estimate of their quality.

Of new VERBENAS there has been a considerable number. Mr. Mould's Mrs. Thompson was the only one that received a Certificate of Merit. His Beethoven, Lord Chelmsford, Mr. L. Harrison, Mrs. Mould, Sir Garnet Wolsley, and Sylvia are all fine exhibition flowers. Messrs. Cannell and Keynes & Co. have also raised new forms. A rich scarlet variety, named Lustrous, from the latter firm, is characterised by size, brilliancy, and splendid form.

It is only possible to touch on the leading new flowers of the year. Their multitude is prohibitory of anything like an extended notice. The times may be somewhat out of joint, and trade dull, but floriculture will flourish despite apparent, if not real, drawbacks. We turn with hopefulness to 1880, in the full belief that the procession of months will furnish their quota of novelties, and that the new will transcend the old in signs and tokens that will be as a valuable legacy to floriculture when the year on which we are now entering fades away into the irrevocable past. R. D.

## Garden Operations.

### KITCHEN GARDEN.

PEAS.—The season for this invaluable and much esteemed leguminous edible in a green state is looked for with much more interest than the coming in of many other subjects, simply because it is a vegetable so universally appreciated, and for this reason it is grown everywhere. The advanced crops at all places, without exception, are given the best position the garden affords, and every attention and care are given to them in order to obtain them in a fit state for use at the earliest date possible; but after all, how often does it follow that the ultimate result is much delayed, and oftentimes very disappointing? Whilst admitting there are naturally some sheltered places situated at a moderate altitude, where frost is not quite so destructive, and where the crop in question may, with some degree of certainty, be depended on almost every year, yet in general this is not the case; and here, as in many other gardens similarly situated in a low valley, with air almost constantly charged with moisture enough to make vegetation most susceptible to frost, the crop is most doubtful. For this reason we have of necessity been compelled to resort to a more certain and effectual method to secure the same end, and from past experience we strongly recommend the practice to the notice of those who labour under like difficulties as we ourselves—it is to have recourse to a temporary erection in the shape of a frame about 3 feet high at the back and 2 feet in front, with a strip under the junction of the lights in order to facilitate ventilation, and a width according to the size of the lights available for the purpose. This should be placed on a suitable border, and dwarf kinds of Peas only should be sown at about 18 inches apart between the rows, which should run from north to south. With such a convenience, covering an area of about 20 feet by 6 feet, and with ordinary coverings applied, a crop of Peas may be safely secured before the end of May, the average of which will favourably compare with the produce of many outside borders of far greater extent with but little additional trouble. For this purpose we sow thinly, in rows 18 inches apart, Laxton's Unique and Little Gem the first week in January—keeping the lights on until such time as the Peas are becoming visible, when a little air is given them every day. As soon as they are well up they are thinned out to about 2 inches apart, and before they have made much growth they are carefully staked to a height which will just admit the lights to run, and at this time they are mulched with 3 or 4 inches of the best decomposed manure, and well watered whenever necessary, and covered up likewise when occasion requires it.

FORCING DEPARTMENT.—The demand for forced vegetables, like many other things, is steadily increasing at most places, and supplies of Asparagus, Seakale, French Beans, Mushrooms, and Rhubarb are not only expected occasionally, but are supposed to be ready in quantity whenever demanded. After the new year comes in, to maintain such supplies, together with Cucumbers, Chicory, Radishes, Mustard and Cress, with a supply of Carrots and Potatoes in due course, is a task which not only requires much labour and attention, but considerable ability and forethought in management. See, therefore, that timely preparations are made in order to receive the supplementary crops which are to be introduced into the respective places to come in after those which are now in bearing have become exhausted; and it is at this season always advisable, in order to be prepared for an emergency in the way of prolonged frost, to have a small store of roots of Asparagus, Seakale, and Rhubarb on hand for the purpose. Give bearing crops of Asparagus plenty of air whenever favourable, as without this element the quality will be much impaired. Seakale comes good with us this year, and it will be made a substitute to help us out of difficulties which we shall experience in the way of a deficient crop of some of our usual hardy edibles. For this object good quantities of this valuable subject should be put in at intervals as may be required. Rhubarb will with the advance of the year come much more kindly; this will also be in greater request than usual, owing to the short supply of Apples last year. This may be put into almost any place where there is heat, and it will now start freely. Crops which are in bearing will want ample supplies of tepid water. French Beans will, unless the utmost care is exercised, become infested with the red-spider; should this be apparent on the foliage be cautious in removing such plants to newly started vineries or similar places, or the pest will assuredly be quickly established. We prefer to sow the Beans in the houses in which they are to be grown, because it prevents the evil. As advanced crops of Tarragon, Chervil, and Mint show indications of failing, let others be brought in: a Peach-house at work is a fit place for these subjects. Soil-up early crops of Potatoes as soon as they are fit, and use manured soil for the purpose. Sow Carrots for secondary crops, and thin out advanced ones—also

Radishes to succeed former sowings. These will require air every day until rough leaves are made.

**MUSHROOM-HOUSE.**—See to the watering and the sprinkling in this place every day. As the Mushroom-beds become fit for use remove them from the beds, and stand them in trays or shallow boxes until they are required: in this way they will keep good for a considerable time. *G. T. Miles, Wycombe Abbey.*

#### FRUIT HOUSES.

**ORCHARD-HOUSE.**—Those who have had little experience with forcing Peach and Nectarine trees will need to practise patience at this early period. They may expect to see the blossom-buds swell almost as soon as artificial heat is applied, but this will not be likely to happen unless the temperature is kept too high to begin with. It ought not to exceed 45° on cold nights and about 50° in mild weather. If the pots could be placed over a bed of fermenting material, that would excite the roots into active growth at the same time as the buds; but it is very certain that artificial heat must be applied with considerable caution, both to the roots and also to the temperature of the house. Another point to be considered is the supply of water to the roots: I would rather err by giving too much than too little; the atmosphere ought to be moist while the buds are swelling, although it ought to incline to dryness while the trees are in blossom. We are now clearing out the Chrysanthemums from our late house to make room for the trees that are still plunged out-of-doors. They certainly look remarkably well this year, showing that severe and long-continued frost does not injure them, although excessive rainfall probably will; indeed it does, as the late Mr. Pearson, of Chilwell, could testify from his experience at Nottingham, at the time that our trees at Loxford were braving the winter without the least injury—the inference being this, that the rainfall at Nottingham is too much for the trees in ordinary winters, while that in South Essex is not sufficient to cause any injury to them. Where the rainfall is very excessive tiles could be placed over the surface of the pots to throw off the water. I find that when the trees are placed out-of-doors to winter they do not suffer much from the attacks of insect pests of any kind. The Strawberry plants were placed on the shelves near the roof of the house some time ago. We used to grow about twelve varieties, but have reduced the number to less than half. We grow the Black Prince for earliest; this is followed by Keens' Seedling, and it ought to be stated that some persons have a spurious stock of this. An inferior variety was here for the true sort, and I only obtained it through a friend who exhibited the true sort in London. Next to this is President, then British Queen, and lastly Loxford Hall Seedling, which is the latest we have ever grown. See that the pots do not suffer for want of water, but be rather sparing with it until they start into growth. *J. Douglas.*

**ORANGE-HOUSE.**—There is little to be added to the instructions given in the number for December 20, p. 791. See that the requisite temperature is maintained, that the plants receive a sufficient quantity of water, and that the leaves are kept quite clean. It is usually best to trust to the nurserymen to supply us with young trees of most varieties of fruit, and I do not think of propagating any except Oranges; but when the trees are quite clean in a house, it is very monstrous to introduce trees that are infested with scale, and to prevent this I graft our own trees on Lemon stocks. Now is a good time to do it. The stocks for dwarf trees should be about as thick as a cedar pencil, and they may be grafted a few inches above the surface of the ground. After the operation is completed, place the pots (they may be 5 or 6 inches in diameter) in a forcing-house over a bed of tan or leaves, and cover them with a hand-glass; the union will soon be complete, when the trees may be removed from the hand-glass, and be placed over the bed. With careful management they will grow apace, and soon require repotting into 8 or 9-inch pots. By the end of the season the trees will be of considerable size, and after making another year's growth will produce blossoms and fruit. During the season the young growths must be stopped at the fourth or fifth leaves. The potting material should be the turf taken from a clayey loam, with a fourth part of rotten stable-manure and some ½-inch bones, say a 9-inch potful to a barrowload, added. *J. Douglas, Loxford Hall, Ilford, E.*

**PINES.**—In the preceding Calendar upon this matter rather comprehensive remarks were given in regard to the general treatment of these plants for that period which embraces the dullest time in the whole year. The details of management then described should continue to remain in force for the present, excepting in the case of plants which it may be necessary to bring together for the purpose of inducing them to come into fruit sooner than they would under other circumstances. If this should be necessary provide a light place in pit or house, as the

case may be, where they can have the advantage of more heat both at the roots and tops. Assuming this to be done, and a batch is to be selected from amongst the successional plants, choose those which indicate signs of speedily showing fruit. These are quickly distinguished by practical hands, and others may be materially assisted in the matter by an examination of the centre or heart of the plant. Let these plants be plunged into a bed which should be constantly kept at about 90° to 95° at the base of the pots. If the plants be at all dry water them copiously, and maintain the top heat at 65° to 70° at night, with a few degrees more during the daytime, and keep the temperature about the plants in an invigorating and genial state, by syringing, &c., as may be necessary. *G. T. Miles, Wycombe Abbey.*

**FIGS.**—When the terminal buds on the early pot-trees have fairly broken, advantage may be taken of the favourable change to milder weather for increasing the mean temperature of the house, as the Fig, when fairly started into growth, delights in a good heat, plenty of moisture, and all the light that can be secured to it. On this account the glass should be kept perfectly clean, and the increase will be more beneficial if it can be obtained from fire-heat combined with solar influence by day, in preference to making any great advance by night. Syringe the trees and walls twice a day, according to the state of the weather, and damp the floors in the evening when the weather is dark, wet, and unfavourable to the performance of the afternoon syringing. Examine the plunging material, and if it exceeds 70° to 75° let it be turned over as a means of reducing the bottom-heat, and setting moisture at liberty. Aim at a night temperature of 55° to 60°, give a little air at 68° when the morning gives promise of an increase from gleams of sunshine, and close sufficiently early for the house to run up to 80° after it is shut up. If the succession-house is conveniently arranged for the introduction of a good body of fermenting leaves and short stable manure, but little fire-heat will be required by night until the buds show signs of swelling, particularly when the trees have been started about the same time for a number of years; but young trees that have not been forced will require a somewhat higher temperature to cause them to break. Syringe twice a day with water a few degrees warmer than the house, and if it be thought necessary to repeat the root-watering, use water at a temperature of 80° to 90°. Prune or rather thin-out the wood that has reached the extremity of the trellis in late houses, wash the trees well with warm soap-water, and, in the event of scale having gained a lodgment, a wineglassful of paraffin to the gallon of water may be used with advantage. Put in cuttings or eyes of favourite kinds, and make preparations for potting on young plants intended for next year's forcing, using strong loam, old mortar, and a little thoroughly rotted cow-dung. Train to a clean, straight, single stem, and allow the radiating shoots to form the foundation of a good pyramid. If wanted for early work the plants should be placed in gentle bottom-heat by the end of the month, in order that they may make and properly ripen their growth by September. *W. Coleman, Eastnor.*

#### PLANT HOUSES.

**ORCHIDS.**—The year 1879 is gone, and these plants have no cause to lament over its departure. Time has glided us into the new year, the first day of which is looked up to by so many as the starting point in many undertakings. In Orchid culture the new year does not commence or finish at any particular period, but may be taken as the centre of the resting and slow-growing period, which extends from November to February. The remarks in the two last months' Calendars are still appropriate. For the benefit of new readers of this paper I may as well state that I group the various structures in which Orchids are grown into three divisions—namely, cool-house, intermediate-house, and East Indian-house. In the aforementioned Calendars their respective temperatures are given as, night, 45°, 55°, 60°; day, 50°, 60°, 65°, as maintained by fire-heat, with a few degrees rise by sun-heat, and a few degrees less during exceptionally severe nights, when the houses, owing to the unusual amount of fire-heat, are, comparatively speaking, dry. During the last six weeks our night temperatures have rarely been, for a short time even, below those given; on some days our temperatures at noon have been a few degrees above those given, but a trifle of air has been on at the same time. In the three houses or divisions mentioned almost every tropical Orchid can be grown more or less well; at the same time, where a large number of some particular class has to be grown, it is wise to give them a structure to themselves. Thus in many places there will be besides those mentioned a Cattleya-house, a Mexican-house, and a Dendrobium-house. The Cattleya-house will be a low light structure containing such plants as *C. Mossie*, *C. Trianae*, *C. gigas*, *C. Mendelii*, *C. labiata*, *C. maxima*, and *C. exoniensis*, &c., with an intermediate temperature.

The Mexican-house will be thinly shaded, so as to receive abundance of sun-heat and light. It will contain such plants as *Laelia majalis*, *L. acuminata*, *L. autumnalis*, *L. albida*, *L. furfuracea*, *Odontoglossum Londeborghianum*, *O. citrosium*, *O. Reicheneimii*, *Epidendrum nemorale*, *E. Parkinsonianum*, &c. The winter temperature of this will be a trifle under intermediate. The Dendrobium-house will be somewhat lofty, so as to allow of that family being suspended from the roof. A whole host of plants requiring a less close atmosphere than the Phalenopsis division will furnish the side stages. Through the summer this house will be hot, moist, and airy; and in the winter a trifle above intermediate. If any reader possessing only the first-named divisions should find me at any time recommending the growing of some plant in one of the last-named ones he need not despair, but may take it for granted that in some portion of his houses conditions almost identical with those advised can be found.

After six weeks' almost close confinement, no collection of Orchids will look in quite so brilliant a condition as they did at the commencement of winter. The foliage of some of the plants will be looking more yellow than usual, and too often in such cases water is rushed into them in order to speedily bring them green. This is a fatal error, ending as it does in the destruction of the roots. The proper thing to do is to keep the plants rather on the dry side, trusting entirely to the genial atmosphere which, thanks to a south-west wind, it is now easy to maintain, to bring them round. With such a gale of wind as we are now getting, there will be no necessity to open any ventilators, as enough fresh air will be forced through the laps, which are excellent and safe ventilators. As regards open laps, I have no hesitation in saying that nearly every Orchid-house would be all the better if a pane of glass here and there overlapped its fellow enough to keep out the rain, but with a space between sufficient for a penny to pass through. Houses in exposed positions will of course require no such openings.

Plants of *Cypripedium villosum* and *C. Boxallii* will now be fast sending up their flowers, which will require guiding up through the luxuriant foliage these plants make, or they in some cases get weighted down with leaves, and so grow distorted. In tying up the flowers of large plants where the breaks have become much crowded, care must be taken that the stakes do not injure the growths. *J. C. Spyers, Burford Lodge, Dorking.*

#### TOWN GARDENING.

The late hard frost gave a good opportunity for getting flower-beds and borders manured—that is to say, to have the manure carted or wheeled on and laid in heaps, so that when the season arrives for planting the manure may be spread and forked in. It is not a good plan to have the manure put on and dug in, in the autumn, as is often done; for if a wet winter follows all the goodness of the manure will be washed away before the planting season commences, and the labour and manure will be lost. Now is a good time for planting and pruning trees and shrubs, and turning in plantations, if not already done. With regard to pruning flowering trees and shrubs, I would remark that there should be a certain amount of discretion used before cutting off a branch. Look and see if it is necessary to cut it off, for remember that every branch in many flowering shrubs is a bunch of flowers. I do not think there is much gained by pruning flowering trees and shrubs: if it can be avoided the best plan is to thin them out and re-arrange them. Nothing looks worse than to see a lot of naked sticks, the result of rough pruning, standing about in plantations. The last two winters have proved a very hard time for border plants, such as Veronicas, Phloxes, Pentstemons, Antirrhinums, Hollyhocks, &c. Last season nearly all were killed, and the present seems so far to have been equally as destructive to those that are left out. It is not wholly the frost that kills them, it is the fog. I have known Pentstemons, Antirrhinums, killed in one day with fog and frost combined. There are very few border plants that will stand out in town in such winters as this and last. Plants that are quite hardy in the country require a cold frame in town, and even such things as Pansies, Golden Thyme, *Mentha Pulegium gibraltaricum*, and *Cerastium tomentosum*, *Veronica incana*, and *Sedum glaucum*, are the better for being taken up in the autumn and planted out early in the spring, for if left out nine-tenths will be lost. This is a very bad season for keeping bedding Pelargoniums, the season being so wet when the cuttings were put in which caused them to be so sappy that a very small portion of them were well struck before they were potted off. I am speaking of cuttings that were put in in the open ground, which I believe is the best plan to follow. Pot them in the latter end of September in small 60's to stand through the winter, and one plant in a small 60 in the spring will be worth two of those crowded six to ten in a 48. *W. Gibson, Royal Hospital Gardens, Chelsea, S.W.*

## APPOINTMENTS FOR THE ENSUING WEEK

MONDAY,	Jan 5	{ Sale of 700 Japanese Liliun auratum, at the Mart, by Prudden & Morris.
WEDNESDAY,	Jan 7	{ Sale of Roses, Bulbs, &c., at Stevens' Rooms.
THURSDAY,	Jan 8	{ Sale of Orchids, at Stevens' Rooms.
FRIDAY,	Jan 9	{ Sale of 1,500 Japanese Liliun auratum, at Stevens' Rooms.

AN appropriate subject at the present time is that of FORCING, and one that is testing the mettle of gardeners as well as the metal of boilers. First let us define the word forcing, which in a broad sense is as comprehensive a subject as any with which we have to deal in horticulture. Forcing is a work of time and skill rather than a display of stoking capacity or of mathematical exactness in the daily readings of the thermometer, and yet stoking has an important bearing upon the work of forcing, inasmuch as it affects the commercial value of the crop.

Forcing consists in changing the season of fruiting of the Vine or Peach tree, or the hastening of the flowering period. Outside the horticultural circle early produce, whether it be fruit, flowers, or vegetables, is regarded as the natural outcome of artificial heat and moisture—a mere mechanical process—such, for example, as a joiner would employ in making a chair or table, or a plumber in mending a burst pipe, and so on. Is this a fact?—is forcing a merely mechanical operation requiring nothing further than a fairly equipped hot-water apparatus, and a capacity for shovelling on coals in sufficient quantity to keep a house at a given temperature? If this were so the gardener's lot might fairly be compared with that of an ordinary mechanic, nor would the majority of the gardening fraternity object to such comparison if this assumption fairly represented their position: but how different is the true nature of the case. The mechanic having a fairly good set of tools to perform his work, and being a wood workman, fulfils his engagement creditably. The gardener, however well he may understand his work, is more or less at the mercy of the clerk of the weather, who cannot be said to have been over-lenient with the sons of Adam during the past year. Nor must we lose sight of the fact that in forcing the preparatory process, in other words the ripening of the wood of all kinds of fruit and flowering plants, is influenced in no inconsiderable degree by the conditions, whether favourable or otherwise, under which they have been grown the season before. Thus the practitioner who understands his work will review his position before starting, and if he is not a mere machine or a rule-of-thumb person, who is merely prompted by what he has seen others do, irrespective of circumstances, he will have a pretty accurate conception of what results may be expected after he examines the condition of the material which is to be forced.

Having determined a course of action to be pursued according to personal requirements, the next point to be considered is the principle upon which forcing should be conducted; and here again we turn to the great storehouse of Nature for an example. The days of steaming, stewing, and roasting, by means of trough-pipes, fermenting materials, &c., are happily being succeeded by a more rational system. Take the Vine, for instance, planted against an open wall, and mark when the sap first begins to move by the action of solar heat, and see if there be any precedent for

building hotbeds from 2 to 3 feet deep on our outside Vine borders. It is the elaborated sap stored up in the branches that first moves in response to the action of solar heat, and not from any effect that is produced at the root by the application of fermenting heat, although an influx of water from the root is very speedily called for. By way of illustration it may be urged that a Pear or other fruit tree, trained, say, partly on a west and partly on a south wall, will be clothed with flowers and leaves on the south side several days before there is an expanded flower on the west side; proving conclusively that Nature, left to herself, does not start into active growth at the root until she has expended the supplies with which she had filled the cells and tissues during the season of maturation the year before. Artificial heating of Vine borders by means of dung beds "in the first stages of forcing" is therefore wrong in principle, and, indeed, it is impracticable—even if it were necessary—to warm a body of earth from the surface to any appreciable degree; and secondly, if its power be admitted it is applied at the wrong time, as it deranges the legitimate course of Nature by forcing root-action prematurely, to the subsequent injury of the crop. Those who follow the course of Nature rigidly, and whose principle it is to assist her according to her own teachings, will therefore have entrapped the warmth of the summer sun, and prevented its escape in late autumn by covering their borders with a thick layer of dry Oak leaves. These should be protected by boards laid obliquely from the front of the border to the back, in order to throw off the heavy winter rains, which would cause them to ferment and rot, thereby rendering the surface of the border a cold stagnant mass. Some persons defeat the very object they have in view by raising beds of material which ferments quickly, and ultimately rots, leaving the border seldom at the same temperature for three days in succession. The same rule is applicable with regard to the internal temperature—with this qualification, that there is no objection, except that of appearance, to a slight body of fermenting dung and leaves being placed contiguous to the Vines in order to engender a gentle warmth, and steam to assist the forces to break, representing in an artificial way the influence of an April shower.

And again, forcing is not, or rather ought not to be, as is commonly supposed, a very expensive series of operations. A vinery, or Peach-house, for instance, at the present time will not exceed a temperature of from 45° to 50°, or a very little more, at night; and bedding plants, or anything else, can hardly be safely left at a lower temperature for the night. It is in the last stages that fire-heat comes in useful, and that is when the increased heat makes the mark. Strawberries, like the Vine, will only bear hard forcing at the finish, and are generally grown in forcing-houses with other things. Melons and Cucumbers, being raised from seed, require a rather high temperature, and are perhaps the most expensive early commodities that we grow; but upon the whole, forcing (as far, at any rate, as fruit is concerned) is more a work of skilful computation than is generally supposed.

— THE CHANGE IN THE WEATHER. — The wind bloweth where it listeth, just as it did in the time of the sacred writer, and still are we unable to tell of its whence or its going. Science somewhat cruelly tells us that somewhere or other Nature has produced an apparent vacuum which the wind is rushing in to fill up, but that still leaves behind the impression that the wind which rushes in with such fierceness and strength must leave a vacuum elsewhere; and thus the lay mind is puzzled when a discussion on natural causes comes uppermost. Based upon the hypothesis that there must have been a very considerable vacuum somewhere to necessitate such a

rush of air as was experienced on Sunday last, and holding, as all orthodox believers in science-teaching should, that vacua are created by an excessive heating of the air somewhere, which causes it to ascend, and thus make room for the onward rush, we naturally wonder whereabouts in north-eastern regions has this extraordinary heat been found. So far, however, from there being any reason to prove such to be the fact, we really have seen, or rather felt, an immense volume of warm air rushing to expel the cold, and thus inverting the order of things as taught to us in our elementary science books. It would doubtless be a great advantage to us in an enquiry of this kind if we could get behind the south-west wind and trace its origin, its gathered force, and how it is impelled. The orthodox theory seems to be that of suction or attraction; but in the present state of knowledge of the action and cause of winds and currents, the explanation does not satisfy the enquirer. Though all due to natural causes that are perhaps not difficult of explanation, yet the sudden change in the temperature, and in the nature and force of the air currents, seems little else than the result of some phenomenon. To steadfast believers in the influence of the moon upon the weather, this very remarkable change, coming almost simultaneously with its attainment of entire fulness, will be regarded as positive proof, so much will one success outweigh a hundred failures. Whatever the cause, none the less is the change most welcome, and if we have seen the worst of the present winter, the more heartily will we greet the glad new year.

— THE STORM IN SCOTLAND: DESTRUCTION OF ORCHID-HOUSES. — DR. PATERSON writes from Bridge of Allan, under date December 29:—

"Last night (December 28) we had a most terrific storm of wind and rain. Such a gale has never been experienced in Bridge of Allan. Along with other damage done, I regret to say that two of my Orchid-houses were blown down at the same time as the Tay Bridge was destroyed, causing such lamentable loss of life. The injury done to the plants is wonderfully small, and it was very fortunate that the temperature, for the season, was high, being 52° Fahr."

— ARGENTINE HORTICULTURAL SOCIETY.— This society proposes to hold an international exhibition of fruits, plants, flowers, and other matters of garden interest at Buenos Ayres, from February 22 to February 29 next. It is hardly likely any of our exhibitors will send plants or fruits, but seeds, bulbs, tubers, implements, &c., are mentioned in the programme. Prizes in the form of medals will be awarded. Señor FERNANDO MAUDUIT, 101, Reconquista, Buenos Ayres, is the secretary, to whom application for information should be addressed.

— DIOSPYROS KAKI.—M. NAUDIN writes from Antibes:—

"I see in the last number of the *Gardeners' Chronicle* (p. 795) that Mr. WILSON presented to the Horticultural Society a ripe fruit of Diospyros, similar to a Tomato, under the name of Kaki. This name is incorrect; the Diospyros with red fruits (slightly 4-lobed) is the D. Schi-tze of China and Mongolia, a more hardy species than Kaki, which is Japanese. I have collected this year more than a hundred fruits of D. Schi-tze, in which I have not found a single seed. The fruits of Kaki are smaller, have neither ribs nor furrows, and they are never red, but greenish-yellow, which changes to brown when ripe; moreover, they always contain seeds, about seven or eight in number. Like those of Schi-tze, they only become eatable after having been exposed to frost. In this state the fruits of Schi-tze, which are very beautiful, can never be mistaken—before the frost they are always slightly sour. One can hardly understand how Mr. HILKIN, in his admirable monograph of Ebenaceæ, could have confounded D. Schi-tze with D. Kaki. These two species are quite as different one from another as are the Melon and the Cucumber—one may recognise them a mile away."

— THE MARNOC PORTRAIT.—We are informed that this very successful portrait of a greatly respected man—the landscape artist of our day—has been presented, with an appropriate letter signed on behalf of the subscribers by the Rev. Canon HOLE. An original painting of one of the gardens laid out by Mr. MARNOC has also been purchased for presentation to him. May his declining years be cheered by the feeling of gratitude which is felt for one who has done so much to enhance the pleasure and happiness of others.

— THE BITTER VETCH.—It is only the other day that we had occasion to record the finding of the charred seeds of this plant, *Ervum Ervilia*, amid the ruins of Troy. A more practical, but not the less important aspect is given to the plant by Mr. SOUTHALL, who, in the *Pharmaceutical Journal*, devotes a long and interesting paper to the history of this plant, to whose poisonous properties the death of sundry pigs in divers places has been traced. Under the name of Egyptian Peas or Rovi, seeds are imported, the meal of which has been proved to be poisonous. The seeds when grown by Mr. SOUTHALL turned out to belong to *Ervum Ervilia*, the poisonous properties of which are well known. The seeds have a dangerous resemblance in colour and size to the

— MIGRATION OF PLANTS, AND REPLACEMENT OF ONE SPECIES BY ANOTHER.—About thirty years ago, as we read in the *Botanische Zeitung*, only one species of *Xanthium* grew in the neighbourhood of Posen, and that was *X. Strumarium*, which was very common. Since that time, however, and shortly after 1850, as herbarium specimens prove, *X. italicum* appeared, and soon almost entirely supplanted *X. Strumarium*. The latter retained its ground in a few isolated places, especially about farmyards. It was curious to note, about four kilometers north of Posen, that on one side of the broad sandy road, where there are some cottages, hundreds of plants of *X. Strumarium* flourished, whereas on the other open side not a single plant of

or other occupations, few of whom can be brought to understand that a trench should be as broad at the bottom as at the top, and why, if this mistake be pointed out, still persist in the blunder. It is not because of any wilful desire to be obstinate that they do the work so imperfectly, but they are as a rule the victims of ignorance and of want of educational training in early years. Nothing can be more stupid or false than the common expression that we are in danger of educating our agricultural labourers too much, for in the most elementary or common avocations, such as in trenching, digging, mowing, and many other acts of labour, the best taught man will always show the highest intelligence, and make the best workman. Such an one will soon perceive that in trenching he

FIG. 4.—LITTLE ASTON HALL, SUTTON COLDFIELD, THE SEAT OF THE HON. E. S. PARKER-JERVIS. (SEE P. 12.)

Egyptian Lentil, which is so cheap and useful an article of food. The true Lentil, however, is, as its name implies, lenticular, convex, like a watch-glass, on both sides, while the Bitter Vetch seeds are more nearly triangular; still, when mistakes are made between Aconite and Horse Radish, it is reasonable to expect much more frequent mishaps between the two seeds in question. The Rovi seed of the Greek Archipelago is considered by Mr. SOUTHALL to be the *Orobus* of the ancient Greeks. He tells us, moreover, that the poisonous properties may be eliminated by soaking the seeds in water, and probably by decortication. As the matter is one of some considerable importance, we hope that Mr. SOUTHALL will supplement his historical notes on the plant by some experiments on the best way of neutralising its poisonous properties, whether by heat or by soaking, or both.

this species was to be seen, though *X. italicum* abounded. On the other hand, the latter was only very sparingly associated with the former on the inhabited side of the road. Hybrids between the two species are not rare.

— TRENCHING.—There are few winter garden operations of more value than trenching, but that value largely depends upon the way in which it is performed. In all good private gardens where it is the rule to deeply move all vacant ground, to the extent perhaps of one-fourth of the whole area of vegetable ground each winter, trenching is usually well done, because the labourers get plenty of training in this peculiar work, and not only know how it should be done, but, what is more satisfactory, want little looking after. This kind of appreciation, unfortunately, seldom applies to men taken from the field

must have his base as wide as the top, and the sides of the trench must be perpendicular, and no cores allowed to remain. Whether the work shall be deep or shallow must depend upon the nature of the sub-soils, as gravel should be let alone, and clays incorporated slowly. It is in this deep cultivation that garden culture so much excels field culture, and enables crops to be grown that, if universal, would make England the most prolific country in the world.

— BIRDS AND BERRIES.—A warm-hearted feminine friend of wild song birds has been writing to the papers protesting against the wanton waste of the natural food of our aerial warblers seen in the enormous use of berried Holly and Mistletoe at Christmas. It is not so much the use of these hardy shrubs for decorative purposes against which the protest is directed, but rather against the withdrawal from free

access by the birds in trees and woods of so much good food for them at a time of the year when, as seen this winter as well as last winter, the poor birds have need of every berry to keep their little bodies from starvation. It is scarcely probable that such an appeal will be heeded; it appeals too much to men's selfish desires and fancies grounded on long established custom. The use of Holly and Mistletoe so universally at Christmas is, apart from all considerations such as arise when the birds and hard winters are in view, a pleasing and delightful custom. It carries some of the charms of the country, of its trees and woods, into the midst of our dull and gloomy town life, and evokes much that is sweet and loving in our work and in money-grubbing humanity. Still the birds deserve some consideration. If there are berries enough for them and to spare there is no room to complain, but there seems to be a universal consensus of opinion that berries suitable as bird food are comparatively scarce. Those who have taken from the birds Nature's food unthinkingly, may well in the season of human festivity remember our feathered friends, and scatter for them, when frost and snow robs them of their proper food, such crumbs and seeds as may save them to charm and delight us with their songs in future years.

— GORDON'S "PINETUM."—A new edition, or a new issue (for it is called both) of this well-known book has just been published by Mr. H. G. BOHN (Henrietta Street, Covent Garden). The publisher has added a reference list of coloured plates to three books only—LAWSON'S *Pinetum*, LAMBERT'S *Pinus*, and FORBES' *Pinetum Woburnense*—all three valuable books, but not very accessible to the majority of people. A full list of references to figures, especially to books that are easily accessible, might easily have been compiled, and would have added materially to the value of the work. It is a pity, however, that it should not have been critically overhauled before re-issue, so as to have increased its trustworthiness. Though dated 1880 we have not found any additions to the addenda as published in 1875; moreover, the very trade catalogues bound up with this new edition or new issue bear the date 1875.

— THE GARDENERS' ROYAL BENEVOLENT INSTITUTION.—At the annual meeting to be held on the 14th inst. nine applicants, whose cases have been carefully investigated and found in every way satisfactory, and who, or their husbands, have been subscribers for over fifteen years, will be placed on the pension list without the trouble or expense of an election; this will exclude all other applicants who have not subscribed so long, or not at all. We desire to give prominence to these facts, because some time since, we had occasion to appeal to the gardening fraternity to contribute more of their mites to the funds, so as to render less obtrusive the objectionable disproportion between subscribers who are, as it were, outsiders, without expectation of ever profiting by the Society, and those of the craft, any one of whom may, for aught he knows, live to be thankful for the benefits it yields. When we appealed for help on behalf of the Society, the appeal was not responded to as we hoped it might be. Moreover, it brought us letters stating that, for the work they do, gardeners are ill paid—that is, the better sort of gardeners—in comparison with the steward or the butler, or even the under-butler. Another told us that he had subscribed for a time, but was obliged to discontinue doing so, owing to the many calls upon his slender income. We do not dispute such facts as these, but now comes a more serious matter, which we mention because, as will be seen by our opening sentence, whatever may have been the case formerly, it does not hold good now. "I was often disgusted," says a correspondent, speaking of some twenty years back, "to find men placed on the list and carried through, while subscribers were passed by. Interest rather than compliance with the regulations served to secure the benefits of the Institution." If this were so once, of which we express no opinion, it is clearly not so now, and it is time that so injurious an opinion should be annulled. Other alleged reasons for non-subscription are the facts that the pensions are so small and so few. The obvious answer to this is that they are few and small in proportion to what they ought to be, simply because the funds at the disposal of the Society are small also. We are quite aware that a gardener with from £60 to £100 a year, and a family to educate, feed, and

clothe, cannot spare a guinea a year for the Society. But where guineas cannot be expected shillings or even pence might be; a general collection in all garden establishments once a year would surely suffice to place a few more pensioners on the list or augment the existing pensions. Moreover, it would encourage those whose duty it is to beg from richer men on behalf of the Society to undertake their task with a bolder front by enabling to say, as they cannot fairly do now, that the gardeners do their best to support their own Society and should be helped accordingly.

— EPPING FOREST AND COUNTY OF ESSEX NATURALISTS' FIELD CLUB.—The inaugural meeting of this Club will be held on Saturday evening, January 10, at 3, St. John's Terrace, Buckhurst Hill; the chair to be taken at 7 o'clock by R. MELDOLA, Esq., F.C.S., &c., Secretary to the Entomological Society of London. The objects of the Club, as set forth in the proposed rules, are:—"The investigation of the natural history, geology, and archaeology of the county of Essex (special attention being given to the fauna, flora, geology, and antiquities of Epping Forest); the publication of the results of such investigations; the formation of a library of works of local interest and other publications, and the dissemination amongst its members of information on natural science and antiquities." Excursions, under skilful direction, to various localities of interest to the naturalist and antiquary, will also be a main object of the Club. We are pleased to hear that the Club will strongly discourage the practice of removing rare plants from the localities where they are to be found or of which they are characteristic, and of risking the extermination of rare birds and other animals by wanton persecution. The Hon. Sec. *pro tem.* is Mr. WILLIAM COLE, Laurel Cottage, Buckhurst Hill.

— VEGETABLES IN LONDON.—"C. L.," writing to the *Times* from Manchester on December 29, says:—"Some six months ago I happened to be in Covent Garden when a sale of fruit and vegetables was being held. I saw Asparagus, which, I presume, had been consigned for sale, knocked down at 1s. per 100. I followed the buyer to his shop there, and priced the same bundles which he had just brought with him from the auction, and he told me that the price was 2s. 6d. per 100; that is, 150 per cent. was the profit put upon the articles, for which the grower would receive only 1s., and out of this shilling he would have to pay rent for the soil, manure, labour, carriage, and commission, not to mention the time he has to wait for Asparagus to mature. I said to myself, 'Why is this thus?'"

— GENISTA PRÆCOX.—This graceful shrub has withstood the late severe frosts, and is not injured in the least, while the white Broom is cut down to the snow line. We remember seeing last spring, in the Vork Nurseries, two fine specimens of this handsome Broom, where it was flowering most profusely. The bushes were literally smothered with drooping racemes of pale yellow flowers. For planting in borders, shrubberies, or on rockwork, it is very useful and conspicuous.

— INSTITUTION OF SURVEYORS.—The next meeting will be held on Monday evening, January 5, 1880, when a paper will be read by Mr. E. R. ROBSON, member, entitled, "The Non-Educational Work of the School Board for London." The chair to be taken at 8 o'clock.

— THE WINTER IN SWITZERLAND.—The Geneva correspondent of the *Times* writes, under date December 28:—"A peculiarity of the present season in Switzerland, which will doubtless prove interesting to meteorologists, is the fact that, while extreme cold prevails in the valleys and at low elevations generally, the weather in the mountains is mild and enjoyable, and the temperature for the time of the year is unusually high. In the early part of last week, relates a Lucerne paper, two young men, weary of the icy cold and perpetual fogs of the valley, made an excursion to the Righi. There they found unclouded sunshine, and the slopes about the Righi-Kulm Hotel were free from snow. In the middle of the day the thermometer marked 18° above zero (64° Fahr.), and on the southern slope of the mountain below Kaltbad, *Gentiana verna*, *Gentiana bavarica*, and other alpine plants were in full bloom. A correspondent of

the *Bund*, writing from St. Beatenberg, near Interlaken, on Christmas Eve, describes the weather there as superb. The sun shines from 8.30 in the morning to 4 o'clock in the afternoon in undimmed splendour. Children play about in the open air as in summer; fires in the daytime are unnecessary; people sit out on their balconies; the trees are beginning to bud, and the snow has almost disappeared."

— CENTIGRADE THERMOMETERS.—M. NAUDIN writes:—

"At p. 792 of your last volume I see a criticism on the use of the Fahrenheit thermometer, which appears perfectly reasonable. This thermometer is in fact one of the most inconvenient. The Centigrade is objected to because the degrees of temperature are too large; but this objection is cleared away by the fact that the degrees may be divided into ten, and, at will, into one hundred sub-divisions. The Centigrade thermometer is in reality a Milligrade thermometer, and even Dix-milligrade. In everything simplicity is better than complication."

— "THE ANTIQUARY."—This is the title of a new monthly periodical "devoted to the study of the past" (ELIOT STOCK), but judging from the excellent article on the value and charm of antiquarian study, evolution and progressive development are as characteristic of the modern antiquary as conservatism and narrowness of view were in the case of the Dryasdust of olden time. The publication before us may be safely recommended as interesting to others than professed antiquaries. The paper and type are excellent, but is it heresy to suggest that the rough edges be carefully ploughed off and the sheets folded evenly? With all our reverence for antiquities, we do not think it is good sense or good taste to copy defects and imperfections.

— A WINTER BED OF FLOWERS.—Miss HOPE, writing from Wardie Lodge, Edinburgh, on December 26, and forwarding an excellent photograph, says:—

"The late season is the cause of our having a fine bed of flowers this Christmas week. I send a photograph taken on December 16. The *Helleborus niger maximus* (?) is quite three weeks later than ordinary. There are above one hundred blooms fit to cut, and more than one hundred buds to come on. Facing the south we covered the bed with thin mats to prevent the sun thawing the frozen flowers suddenly. Plants of the same *Hellebore* away from the south were unprotected, and have stood the severe frost perfectly. We are between 2° and 3° higher than the Botanic Garden. A row (36 yards) of the double *Colchicum autumnale* is also late, and the snow having protected the flowers, it is now in fine blow. At Messrs. METHVEN'S nursery to-day I noticed a large bed quite lilac. Mr. MCKENZIE said he never had had them so late. It is very delightful to have two plants in quantity and in perfection of flower, after such a storm as we have already experienced this winter. The *Aucubas* (all sorts) have suffered desperately about Edinburgh, and wherever we turn our eyes here we are met with the burnt black foliage. The outline of METHVEN'S Coniferous beds is quite black; *Aucubas* are not to be counted on for winter beds if a wet summer and unripening autumn has preceded. Our 27 yards of *Rosemary* has again suffered as it did last winter, and again the half that is protected by a wall is browner than the portion merely backed by evergreens."

— A GARDEN BOTHY IN FRANCE.—As most gardeners have had some experience of bothy life in this country, it may interest them if we give some details concerning the bothy at Ferrières, the seat of Baron A. DE ROTHSCHILD. The bothy at Ferrières is a large house, three storeys high, which stands at the bottom of the *flouriste*, a department of the establishment in which are situated the forcing-houses and pits, and which is separated by a road from the show garden. The front of the house faces a large yard, in which is a shed and stables for the housing of the horses, vans, carts, &c., employed in the park and gardens. The ground floor of the house is occupied as a stable for four horses, next to which is a kitchen for the young men, a large dining-room and a store-room. On the other two storeys are twelve single-bedded rooms, a large fruit-room, and seed-room; the accommodation being for twelve young men. Each room contains bedding, table, chair, wash-stand, cupboard, and looking-glass, and, not forgetting a most useful thing in winter, either a fire-place or a small stove. The wages average from £3 4s. per month to £5, with

fire and light free. To do their cooking the young men have a cook, one-half of whose remuneration is paid by themselves, and the other half by the gardens. The working hours are from 6 A.M. to 6 P.M., two hours being allowed for lunch (*déjeuner*), viz., from 11 to 1 in summer. In winter they begin at daylight, and finish at dark, with only one hour for lunch. On Sunday they all work till 10 A.M., that is to say, they clean their respective houses, and water the plants contained in them. The young men are divided into two sections of six each, and go on guard or duty every other Sunday from 10 A.M. to 6 P.M. Their work is to show visitors round, to take the air off, &c. As regards attending to the fires at night, they take the night-guard weekly in turn. The one then on duty has to look after the fires, which are forty in number. As for the food, it is arranged in the following manner:—Before work in the morning each takes what he likes; at 11 they all lunch together, and dine together at 6. Their bill of fare generally includes meat, either roast, boiled, or stewed; vegetables, cooked in the French fashion; and salad or cheese. They drink wine, which they buy in casks, each of them paying according to the number of bottles he drinks. The cost of food for each man, including wine, averages monthly from £2 to £2 10s., according to the quantity of wine they drink. At new year they each receive a present, ranging in amount from 5 fr. to 20 fr. The day on which falls the *fête* of St. FIACRE, the patron saint of gardeners, is regarded as a holiday, and the young men again receive some little money present, from 5 fr. to 20 fr. each, according to their qualifications. Lately a library has been established in the botany, to which the best of the English and French horticultural papers are supplied; and as the funds get more plentiful books will be bought. The money used for the library comes from gratuities received from visitors, fines paid by the young men for neglect in their work, and an entrance fee of 4s. from each new-comer. We are sorry to hear, however, that, with the exception of a few amongst them, the young men do not seem to care much for improving their knowledge by reading.

— THE WEATHER IN FRANCE. — M. MARIE DAVY, director of the Observatoire de Montsouris, near Paris, remarks that “the present winter is the sixth severe winter of the century. These six winters have recurred with great regularity in three periods of two each, thus: 1788-89 and 1794-95, an interval of six years; 1829-30 and 1837-38, an interval of eight years; 1871-72 and 1879-80, an interval of eight years. Least distance from the first group to the second, forty-two years; least distance from the second group to the third, forty-two years. Is this simply a coincidence? The fact is not less strange. Of these three groups the two extremes are the most severe. Below are noted the lowest observed temperatures, as well as the number of days of frost, as indicated by the thermometer of the Observatoire of Paris:—

Year.	Days of Frost.	Greatest Degrees of Cold.
1788-89 .. .. .	86	11.5 C.
1794-95 .. .. .	64	23.5
1829-30 .. .. .	76	17.2
1837-38 .. .. .	77	19.0
1871-72 .. .. .	59	21.3
1879-80 .. .. .	(?)	23.9

Thus the French, like ourselves, are experiencing the severest winter of the century, and the measures taken for public assistance are unfortunately but too well justified.”

— MARKET VEGETABLES. — The miserable appearance presented by vegetables in markets and shops during the severe weather has found its counterpart even in that favoured market city, Paris. We have so often been told in regard to vegetables, “They do these things better in France,” that we learn with something like surprise that even there hard weather can create almost a vegetable famine, and that prices are exorbitant. The correspondent of a daily paper tells how just recently he visited the chief Paris markets, and found a scarcity of fruit and vegetables, that reminded him of the days of the siege. Leeks had doubled in price, and meagre. Lettuces were quoted at from ten to fourteen francs each, which in normal weather would have been sold at the

rate of two sous each. The French people, therefore, are finding, what British gardeners so long have known, that the weather rules their destinies. Give them a good season, and in all things of the garden they can compete with the best French growers, whilst the French growers find that, under bad weather conditions, they are no better off than their neighbours. Hard weather is a great leveller—it paralyzes work in all kinds of gardens, and in the same way it makes the supply of vegetables everywhere difficult. Those who are so fond of sending their petty complaints about the scarcity of vegetables to the *Times* or other papers, know little of the difficulties that in hard weather surround growers, and render their work anything but enviable. There is so much energy and labour bestowed upon the production of vegetables for the London market, and the profit in past years has been so trivial, that market growers much more deserve sympathy than discredit.

— CHINESE PRIMROSES AT CHISWICK. — Any one interested in the different types of these charming and useful winter flowering plants will find much to interest them at the Chiswick Gardens just now, as Mr. BARRON has flowered a large and interesting collection, including several of the newer Continental types, which are just now in good condition, and afford good tests of comparison. Some of the high-coloured varieties, originally of Continental origin, but which Mr. BARRON has materially improved, are particularly striking in the great depth of red shown by some of the flowers.

— THE LINNEAN SOCIETY. — Mr. N. E. BROWN, of the Herbarium, Kew, who has given much attention and study to the Aroidæ, was elected an Associate of the Linnean Society at their last meeting, December 18.

— TOMATOS IN COLD FRAMES. — Of culinary vegetables there are some so little palatable to those who have not accustomed themselves to their use as to be absolutely nauseous. Amongst these are Tomatos, which notwithstanding the reputation they have ever had as being particularly wholesome, have only in recent years, in this country, become appreciated. And unfortunately, just as people began to rightly estimate them, they have become so subject to disease, like that which affects the Potato, that their cultivation in the open air is very precarious, and for the last two summers has resulted in almost total failure,—a disappointment much felt by those who for a considerable time each summer and autumn look forward to their sunny south walls affording a regular supply. Those who have heated houses, or pits, at command, of course are so far independent of adverse sunless seasons, and are also able to escape the disease, as it has shown itself little under glass. But there are many who like Tomatos whose garden appliances in the shape of artificially warmed houses, or pits, are too limited, or non-existent, to enable them to grow them in this way; yet any one who has an ordinary good-sized garden frame can grow Tomatos so as to have a good supply, even in such exceptionally sunless summers as the past. All that is needed is to sow the seeds sufficiently early, to get the plants on as forward as the solar warmth will admit of, to turn them out in moderate-sized hills of earth placed at the bottom of each light, and to train them on a trellis made of laths, ozers, or ordinary wire netting, supporting it at a distance of 9 inches or 10 inches from the glass, simply giving the plants air proportionate to the weather, and water as they need it, with the requisite thinning of the shoots, and plenty of well ripened Tomatos may be depended upon, as we can vouch from what we have this last summer seen accomplished with such simple means as this. The full flavour present in this vegetable when ripened on the plant, as compared with that which is possessed by the half-matured examples gathered in a semi-green state, and which attain their colour imperfectly afterwards, is such as to leave the latter far in the shade.

— TROUBLESOME WEEDS IN CALIFORNIA. — *Malva borealis* is said to be the most persistent and troublesome weed in California. Mrs. BINGHAM states in COULTER'S *Botanical Gazette*, “It sometimes grows to feet high in cultivated ground. It dies during the dry season where the ground is not

irrigated, but whenever the ground is moistened for a few hours the seeds will germinate. *Solanum nigrum* grows everywhere, blooming and bearing fruit the year round; it is very difficult to eradicate. *Brassica nigra* covers thousands of acres of pasture land, rendering it almost entirely useless. Among other common weeds are: *Stellaria media*, *Matricaria discoidea*, *Hemizonia fascicularis*, &c. *Erodium moschatum* and *Medicago denticulata* cover large areas, and are valuable for pasturage.

— A TALKING PLANT. — In COULTER'S *Botanical Gazette* for November we observe that Sir JOSEPH HOOKER is made to say, respecting *Epipactis latifolia*, which has recently been discovered in America, “Another curious point is that your plant should talk with us of the European varieties of the species, that species being so variable a one, that, *a priori*, it would have been expected that the North American form should have differed from all the European ones.” It would be curious indeed were the American plant to talk of its European or any other relations, but we believe “talk with us” should read “tally with one.”

— A DOUBLE-FLOWERED SEDGE. — In the *Abhandlungen des Naturwissenschaftlichen Vereins zu Bremen*, vi., p. 432, Dr. FRANZ BUCHENAU describes a double-flowered state of *Scirpus cæspitosus*, which he found in company with a friend last summer. Each flower was transformed into a dense tuft of bracts, and it is impossible to decide which answer to the stamens, perigonium, &c., as they are much more numerous than the normal floral organs. No traces of anthers or stigmas could be found. Mr. BUCHENAU regards this as an instance of real duplication, a phenomenon not previously observed by him in the Cyperaceæ, a family to which he has devoted much attention. In 1870 he described double flowers of *Juncus squarrosus* in the same publication, ii., p. 380. We doubt the correctness of the application of the term “double” to such growths, which are not uncommon in grasses, Rushes, Restiaceæ, &c.

— ALLUVIAL SOIL. — By the Thames' side, near Kew, is a small market garden which has been reclaimed from the Thames by an embankment. We are afraid to quote the figures as communicated to us; suffice it to say that, large as the expense was, it was more than recouped in a comparatively very short time. The proprietor has the means, by the use of sluice-gates, of enriching his ground with a fresh layer of alluvial soil at pleasure. The Celery grown this season has been unusually fine.

— HORTICULTURAL PURSUITS. — The paper on this subject, read at Manchester on December 3 by Mr. BRUCE FINDLAY, and of which we gave an epitome at p. 751 of our last volume, has been issued in pamphlet form, at the price of 1s., by Mr. JOHN HEYWOOD of that city.

— A NEW LÆLIA. — Mr. BULL is lucky, and no one deserves good luck better than he. Last year about the same time he was fortunate enough to flower a new *Lælia*, and now again we have to chronicle, on this 1st day of January, 1880, a new variety of *Lælia anceps*—a great beauty, with white sepals, blush petals, and rose-coloured labellum. Next week we shall be in a position to give a full description from the pen of the “arch-orchido-diagraphist,” Professor REICHENBACH, to whom our readers are under so many obligations.

— THE WEATHER. — General remarks on the weather during the week ending December 29, 1879, issued by the Meteorological Office:—The weather was moderately fine and dry generally until the 26th, after which date it became dull, squally, and very unsettled over the whole country. Fog, however, was experienced during the first three days in the S.E., and was very dense all over that district on Christmas Day. The temperature readings in Ireland and Scotland have been high during the whole period. In England, however, a very decided change has occurred, low readings having been reported until the 27th, when a very rapid rise occurred, and the thermometer continued high until the close of the week. The wind was generally south-westerly over the whole country, fresh to strong in force in the West and North on the first few days, and moderate or light in the South and East.

On the 28th a severe gale prevailed in nearly all parts of the kingdom, and on our north-westerly and north-easterly coasts blew with great violence in the evening. The rainfall was more than the average in Ireland and the greater part of Scotland, but again less in all other districts.

— GARDENING APPOINTMENTS. — MR. JAMES MORRISON, who for the last six years has been a Foreman at Dalkeith, under Mr. DUNN, and proved himself to be an able and intelligent practitioner, has been appointed to succeed the late Mr. KILLIS as gardener to Lady MARY C. NESBIT HAMILTON, at Archerfield.

## VEGETATION AND ARCHITECTURE.

THE Gothic arch, such as is represented in our Supplement, in the opinion of some, took origin in the forms presented by the overarching boughs of trees. The supposition is not an unnatural one, but we expect the architects would tell us that the intersection of two round-headed arches of Norman workmanship was more likely to have suggested the form in question. In any case the beautiful curves of the boughs and of the foliage, so admirable not only in their beauty but in their fitness for their vaying purpose, afford lessons which the engineer and the architect can never study too deeply. If the pointed arch really did take origin in the way above mentioned, it might as readily be conceded that the upright mullions and pillars are the representatives of the trunks of trees. We do not think that any one who glances at the forms of vegetation drawn in our Supplement in connection with the lines of the conservatory in the background can doubt that in structural detail, where strength and adaptability to purpose are concerned, as well as in beauty, the conscientious architect is bound to study the contrivances and forms which Nature affords in the disposition of the leaves, the curve of the boughs, the direction and set of the veins, and in countless other matters which a trained eye speedily seizes on, but which are so numerous that not the keenest student can ever hope to exhaust them.

Our Supplement takes the form of an Almanac, and it speaks for itself: but as the postal regulations require us to speak of it also—a thing which otherwise we should be too modest to do—we may venture to call attention to its effectiveness and nicely balanced colour. The contrast between the architectural design and the foliage and flowers is also pleasing, but in reference to the details of the vegetation we shall not be surprised if our artist friends (such of them as are not pre-Raphaelites) are not better satisfied with it than the gardener and the botanist. Last year the artist's leading idea was Egypt, the recent arrival of the Obelisk having given birth to that suggestion; this year there was no Obelisk to commemorate, and our artist was left fancy-free; the consequence is that there are some peculiarities in the foliage and flowers in the upper part of the design which have not yet been observed by the botanist and the gardener to our knowledge.

The calendar matter contains the usual information given in similar publications, with perhaps this important addition, which may not be noticed elsewhere, that on the 2d inst. this journal completes its thirty-ninth year—a goodly age for a gardening journal; and we look to our readers to supply the usual compliments on our condition, only assuring them that we will do our best in the future, as in the past, to merit them.

The column devoted to the mean temperature gives the average mean temperature for each day in the year at Chiswick, near London, as deduced from the elaborate observations of the late Mr. Robert Thompson during forty years, reduced and corrected by Mr. Glaisher. They may be taken as fair representatives of the average temperature of London and its vicinity, and let us hope the weather in 1880 will conform more closely to its proper standard than it did in 1879.

The dates of meetings of the principal metropolitan horticultural and natural history societies are given, and as many of those referring to the provinces as are yet fixed. Among the latter appointments are two which are interesting and significant of the progress which gardening is making even in unpromising localities—we mean the artisan's show on the August Bank Holiday at South Kensington, and the cottagers' show on the same day at Manchester.

## Home Correspondence.

**Daphne Mezereon.**—I observe that my friend, Mr. Harpur-Crewe, mentions this plant as not uncommon some years ago in woods in Bucks. Your correspondent, Mrs. Alfred Watney, a short time since appealed in your pages to "Liss," Hants, for similar testimony. I live a few miles from Liss, and not many years ago I dug plants of *Daphne Mezereon* out of my own woods, from seeds of which I raised a numerous progeny. Two of these I sent the other day to the poet, Matthew Arnold, as a native production. *J. H. Mangles, Valewood, Haslemere.*

**Poisoning by Aconite Root.**—Another of those sad catastrophes which, if they did not happen tolerably regularly, we should suppose to be almost beyond the range of possibility, is recorded from Malmesbury. The family of a farmer partook, on Christmas Day, of Aconite, or Monkshood roots, instead of Horse Radish. All were seriously affected, and the wife, in spite of medical aid, succumbed. When the two plants are in flower it would seem as if no mistake could be made, and even at this time of year it taxes one's faith to believe in such an utter want of observation as to lead any one to confuse the two roots. Size, colour, form, taste, smell, all are different; and even when scraped the yellowish colour, the taste and smell of the pungent Horse Radish are as different as possible from the pinkish hue, faint smell, and at first sweetish taste of Aconite. Terrible calamities such as these might be avoided if a knowledge of "common things"

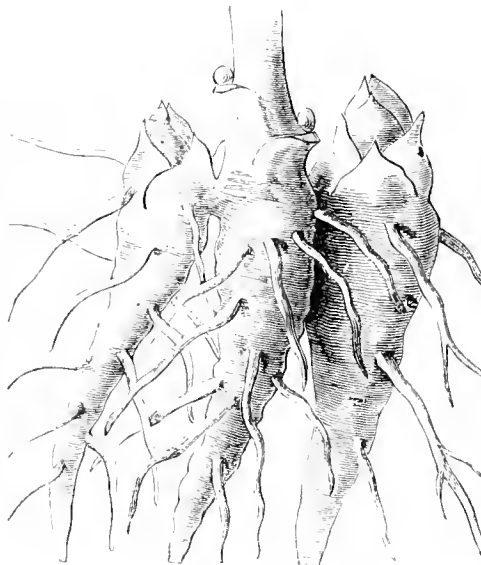

FIG. 5.—ACONITE ROOT, NAT. SIZE.

were insisted on in every school in the kingdom. Surely it ought to be possible to make people use their eyes and their other senses even if it be not possible to endow them with intelligence. We subjoin a cut of Aconite root (fig. 5), showing the central old root and the two new ones for the coming season's growth. The skin or rind is of a more or less deep brown colour, quite different from the pale, dirty yellow tint of the rind of Horse Radish. No Aconite—no poisonous plant of any description—should be allowed in the kitchen garden or the herb border. The slightest amount of ordinary observation and care should suffice to prevent such very unnecessary calamities. *EDS.*

**Magnum Bonum Potato.**—This variety appears to be getting very considerably "improved" since it was introduced by Messrs. Sutton & Sons of Reading, as we now have an "improved" from Messrs. Carter & Co., and Messrs. Webb & Sons announce their "improved." As an amateur cultivator I am getting fearfully perplexed about Potatoes, and if we continue to have such a host of improved varieties I must give up my small garden and take a farm, or cease to be a Potatoist. It would be an immense advantage to such growers as myself if Messrs. Carter & Co., and Messrs. Webb & Sons, would tell us in what respect their "Magnum Bonum" are improvements, and in fact I call upon them to do so; and in the event of not getting a reply through your paper I think we may safely consider that they take to themselves honours not belonging to them, and that in common honesty the Potato should henceforth be known only as Sutton's [or Clarke's] Magnum Bonum. Not that I approve of any dealer taking to himself the honour of being the originator of the variety; for instance, Messrs. Sutton & Sons call the Woodstock

Kidney theirs, and for what earthly reason? This excellent variety was raised by Mr. Robert Fenn, and was one of the results of careful hybridisation, and his name should be connected with it as the raiser, and henceforth it should be known as Fenn's Woodstock Kidney, and Messrs. Sutton should be the first to strike a blow at the pernicious example now so prevalent amongst the great seed firms. It is high time that a protest should be made against this system of appropriating spurious honours. I have before me a catalogue of a pushing seed firm in the Midland districts, who give us their "Improved Sangster's No. 1 Pea," an Improved Early Frame Radish! their selected Scarlet Runner, and a host of other things "too numerous to mention." The same firm has done wonders in Potatoes—such a lot of "improvements;" but oh, you British public! who pays for such "improvements"? *Solanum*. [The fashion being now to charge no more for the "improvements" than for the original types, in what way are purchasers defrauded? *ENS.*]

**Market Prices.**—I have read with interest the discussion in your columns respecting salesmen and their charges, and enclose a bill received from one of my salesmen for your perusal, which salesman is one of the best we can find to sell to. As you will see, had my salesman taken his full commission there would have been very little left for me. The hampers of green stuff consisted of small Elm Savoys, about sixty heads in a 2-bushel hamper—some hampers just the heads out of Brussels Sprouts, others were small Cabbages, somewhat like the Savoys; five or six heads would have made any family a nice dish of greens for dinner. I live about one mile from the station. Those seventy-two hampers cost me as empties about 1*d.* each. All the greens we cut without frost on them, and packed as cut. There were four 1-horse cartloads to take to the station, and every hamper was tied down with good string, and each directed. *N. N.*

"Dear Sir,—I have received from you as under:—

Dec. 20.—32 hampers of greenstuff, at 1 <i>s.</i> 6 <i>d.</i>	..	£2 8 0
" 23—40 "	at 1 <i>s.</i> 3 <i>d.</i>	.. 2 10 0
" "—4 skips of Sprouts, at 3 <i>s.</i> 6 <i>d.</i>	..	0 14 0
		£5 12 0
Carriage .. .. .	£1 3 10	
Commission .. .. .	0 9 0	
		1 12 10

By cheque .. .. . £3 19 2

Green-stuff plentiful to-day. Your hampers were almost unsaleable. You will see that I have not charged you any commission on the last forty hampers, and only 3*d.* on the thirty-two. Yours obediently, —"

**Effects of Climate upon Fruit.**—If the fruit-rooms throughout the country are not particularly attractive this year, there are but few of them it may be presumed, judging from our own, that do not afford some instructive and striking instances of the effects of climate upon fruit generally, and of the vagaries of Pears in particular. The lessons to be learnt in this way may be turned to profitable account by the answer they afford to the question of what to plant in any given locality, or for any particular purpose. Here we have small but ripe and presentable fruit of the following Pears:—Styrian, Flemish Beauty, Forelle, Louise Bonne of Jersey, Marie Louise, Jersey Gratioli, Beurré Diel, Beurré Superfin, and Doyenné du Comice all in together, and all later than usual, some of them being as much as two months beyond their usual time of ripening. Thompson's and Beurré d'Amanlis may be named among the sorts that are only just over, while Winter Nellis, Glou Morceau, Beurré Rance, and a number of other sorts look more likely to wither and be useless than to ripen. *F. Harrison, Knowlesley.*

**Pear Culture under Glass.**—"J. J. M." asks, at p. 801 of your last volume, for information about growing Pears under glass. As I have so grown them for the last twenty years, I can assure him that no fruit is more easy to grow in cold glasshouses, and none repays the labour better. I grow them in both span-roof and lean-to houses, as pyramids and bushes, and also trained. They set only too well, for if there is much blossom the labour of thinning is considerable. If properly treated and not coddled, the flavour is excellent, and as to size and colour, no fruit grown in the open air even on walls can compare with them. In a warm summer they are apt to ripen rather before their time, but the very late sorts keep uncommonly well. My garden is situated in the centre of the island, and in latitude 55½°. I may here say that when people send you communications about the growth of fruits, much more information would be gained by your readers did they always state the latitude or name of the county. I append a list of the different varieties of Pears grown by me under glass:—Chaumontel, Beurré Superfin, Pitmaston Duchess, Glou Morceau, Bergamotte d'Espéren, Beurré Diel, Dr. Trousseau, Orphelin d'Enghien, Doyenné du Comice, Marie Louise, Josephine de Malines, Beurré

d'Arenberg, Passe Colmar, Beurré Clairgeau, Passe Crassane, Madame Milet, Grosse Calabasse, Catillac, Uvedale's St. Germain, Winter Nelis, General Todtleben, Fondante d'Automne, Duchesse d'Angoulême, Beurré Bachelier, Marie Benoist, Easter Beurré, Olivier des Serres, Marie de Guise, Iris Grégoire, Beurré de Ronde, Louise Bonne, Beurré de Jonghe, Conseiller à la Cour, Fortunée. D.

I now have about sixty pyramidal Peas under glass, and they succeed well. They require plenty of water and air in summer. I find the best sorts for house work are Winter Nelis, always good; Glou Morceau, good; and Beurré Rance, and Easter Beurré, have done well this year. The under-mentioned kinds have not ripened but have shrivelled—Knight's Monarch, Joséphine de Malines, and Bergamotted'Esperen. *Wm. Smythe, The Gardens, Basing Park, Alton.*

**Fertilisation of Yuccas (p. 822).**—I have not seen Mr. Meehan's account of the fertilisation of Yuccas, but there can be no doubt that the Yucca can be fertilised by other means than by the agency of the Yucca moth (*Pronuba yuccasella*). I have more than once had well-formed fruit on *Y. recurvifolia*, but the seeds did not come to maturity. Dr. Engelmann, in his *Notes on the Genus Yucca*, says:—"In the Botanical Garden of Venice I gathered the pulpy pods from a large *Yucca aloifolia*, about 15 feet high. This was the only Yucca fruit seen by me in Europe, though I have since learned that in other instances also, though only exceptionally, fruit and good seed have been produced there, principally by the same species, and very rarely by others." As Dr. Engelmann and Prof. Kiley are both positive that the Yucca is incapable of self-fertilisation, it follows that the specimens at Venice and Bitton must have been fertilised by some European and British insect, and it is then not easy to understand why the fruit should not be more frequently produced. *Henry N. Ellacombe, Bitton Vicarage.*

**Mistleto.**—I have been very successful in getting Mistleto to take upon Apple trees. My plan is to rub the berry upon the young wood on the top side of the Apple till it sticks well, in January. I believe that failures are attributable to putting the berries upon the old wood, the roots not being able to get to the alburnum for a support; hence in hot and dry weather the young plant shrivels up and falls off. *John Bolton, Grantham.*

**Vegetables Killed by the Frost.**—When I sent you the letter published at p. 765 of your last volume I expected that a great deal of damage would be done by the frost, and now that it has broken the tale is told. When the frost set in we had a fine lot of Veitch's Autumn Giant Cauliflower sown in, and every one has been killed. Of Snow's Winter White Broccoli hardly any escaped. Carter's Champion and Adams' Early White are also killed; and the Osborns and Backhouses have suffered to some extent, but I think will come round, but will be late. Savoys are completely rotten through; but Borecole and Scotch Kale have stood better. Seakale Beet has stood the severe weather, and the crowns look well. As the spring advances it will come in as a substitute for Spinach, and I think more of it should be grown, as the midrib makes a good Seakale—the green part as Spinach, and where warm pits could be had it can be taken up and planted, and give some first-rate crops through the winter. Spinach Beet has stood well: I find that in some gardens which stand higher than this it has not suffered to any extent. *H. Little, Rusland Hall, Uxerston.*

**Seedling Pelargonium, The Major.**—In an article about a fortnight ago, "On Growing Pelargoniums for the London Market," it was mentioned, if I remember rightly, that they were obliged to be grown at a temperature of not less than 60° at night and 10° more for the day. I enclose you a bloom of a seedling that I have raised and named The Major, that I think will be invaluable for market purposes, as it flowers well at a temperature of 45° for the day and 35° for night. What I send was grown at even less than that. All my other seedlings and also named varieties will not grow out even, much less open, in the same house. I may mention the habit of the plant is good, and it flowers freely. *Harrison Weir, Weybigh, Brechley, Kent.* [This quality, if permanent, will give The Major a high position. It is a good flower, of bold character; the colour a cerise-scarlet. Eds.]

**Vick's Criterion Tomato.**—I send herewith a few fruits of Vick's Criterion Tomato, cut to-day (December 28), from plants that were fruiting in July last. I grow them in pots on the single stem system. They were in a Peach-house till October, when they were transferred to a stove. They now have stems 18 feet long running up the roof. *A. Hopkins, Gr., Ashstead Park, Epsom.* [A nice sample. Eds.]

**The Yellow Amaryllis (*Sternbergia lutea*).**—This autumn flowering bulbous plant has special attractions for the plant lover. In the first instance it may put in a good claim to be one of the "Lilies of the field" whose growth we are enjoined to consider. In the next place its burnished dark green leaves, contrasted with the clear yellow flowers, give it a title to regard which no lover of flowers will dispute. Next, it is quite hardy, its leaves being evergreen, or at least surviving the winter; next, the best way of cultivating it is to let it alone, which saves trouble. Any common garden soil suits it, so that it may be grown in clumps in the border by itself, or in association with autumn Crocus and Colchicums. Stagnant moisture does not suit it in the open ground, nevertheless it is a good plant to grow in glasses like Hyacinths, as we

goniums, intermixed with *Calanthe Veitchii*, *vestita* and *vestita lutea*, which are really magnificent. It is evident from the immense size of the bulbs that Mr. Pratt is thoroughly conversant with the wants and requirements of this beautiful class of Orchids. We have never had the opportunity of seeing bulbs of larger size, nor blooming more profusely. Mr. Pratt is certainly to be congratulated upon his success with this class of plants as well as the Poinsettias. *Visitor.*

**Early Peas.**—During the last eight years we have invariably gathered our first dish of Peas on or between May 20 or 24, excepting last year (1879), when, notwithstanding that the same variety of Peas were sown at the same time, and planted out in the same aspect as heretofore, and in every other respect received the same treatment, they were, like everything else in the vegetable world, a month later. Although our mode of treatment is not new, it may not, however, be so well known as it should be, therefore I will briefly detail our *modus operandi* for the information of those of your readers who, like myself, may be anxious to obtain young Peas as early as possible without having recourse to forcing them. About the end of December or beginning of January we make our first sowing in large 60-pots, which are crocked, and three-parts filled with leaf-mould, and about a dozen Peas put in each pot, which is then covered with the same material, and put into an early vinery near the glass to prevent their becoming drawn. When they have made a couple of inches of growth they are gradually hardened off, and finally planted out about January 20, or as soon after as circumstances may permit of its being done, in a south or south-west border, in rows 4 feet apart and 1 foot apart in the row. The Peas are simply turned out of the pots and planted, with the balls of mould and roots undisturbed, in ground previously and suitably prepared for their reception. This done, a little soil is drawn up to the plants on either side, and then a line of soot and lime follows in the same direction, after which some short sticks are put to them *pro tem.*, and then some short Spruce boughs are placed on either side the rows sufficiently close to shield the haulms from the chilling effects of frost, snow, and biting wind. As the Peas progress in growth, and become injured to the weather, the boughs should be gradually removed, which will prevent their making a weakly growth, and so soon as the weather becomes favourable enough for the purpose (about the end of February) the boughs should be removed altogether and the Peas finally sticked. In conclusion I may remark that we stop the haulms of our early Peas when they come into flower, with the obvious object of causing them to pod quicker than they would under ordinary treatment. The kinds we grow for early crops are Sutton's Kingleader, Sutton's Emerald Gem, and Laxton's William I., in the earliness of which there is little, if any, difference. We depend most upon Kingleader, it being a well tested, good constituted, and prolific Pea. However, William I., in point of size, beats the former, and I have no doubt as it becomes better known it will be grown extensively as an early Pea; but, nevertheless, until it has been fairly tested on a small scale in different districts and soils, it will be advisable to stick to whatever variety has been found to succeed best in each individual district. About the same time that we make our sowing in pots we make a sowing of the same kind, and a row, or rows, according to the length of the same, of Dickson's Favourite out-of-doors, which make a good succession. Our early Beans we treat in a similar way, but in this case we sow a quantity in a box, which, after being properly hardened off with the Peas, are transplanted individually in rows 2 feet apart and about 4 inches in the row. In every other respect, minus the sticks, are treated the same as the Peas. *H. W. Ward.*

FIG. 6.—STERNBERGIA LUTEA.

can testify. The plant is a native of Southern Europe and the Levant. The pollen grains, as drawn by Mr. W. G. Smith, seem curiously marked. Eds.

**Poinsettias at Hawkstone.**—At the present time these are in excellent condition, and well worthy of special notice. The plants are in 4, 5, and 6-inch pots, and from 12 to 18 inches high, many of their floral bracts measure 18 inches across. It is something wonderful the effect produced by this beautiful winter decorative plant when well grown and in quantity, "both single and the double variety," as at Hawkstone. The brilliancy of the bracts is also striking when we consider the sunless weather they have had to develop in. They are arranged amongst a quantity of Zonal Pelar-

**Pelargoniums and Geraniums**—I think it would be as well to settle by authority the exact names of those flowers that seem to be indiscriminately called Pelargoniums and Geraniums. Botany has been described as the "science of giving polysyllabic barbarian Greek names to foreign weeds," but while some plants, *Abies Mariessii*, for instance, are most carefully described, others, as Geraniums, seem to be called by names that do not belong to them, but to quite a different flower. I notice, both in your letterpress and advertisements, mention made of Zonal Pelargoniums: now I should certainly decline to receive Zonal Geraniums if I ordered Pelargoniums. I am old enough to remember that we had a particoloured greenhouse flower of a violet shape that was called a "Geranium;" then came a lot of hardy bedding-out stuff with a truss of red flowers all of one colour, followed by "Tom Thumbs" and "horseshoes," which grew nicely out-of-doors. Then we were told that we must no longer call those greenhouse plants "Geraniums," that their right and proper name was Pelargonium, and that those bedding-out plants were strictly speaking Geraniums. [No, no!] Now, however, the old name Geranium seems to be

dropped for both, and the new name *Pelargonium* given to both, surely erroneously? [No.] Let us, however, have it fairly settled which is which, so that we may clearly and distinctly know what we are talking about, and not make mistakes either in writing or talking, in sending to shows, or in ordering plants. *James Richard Haig, Blair Hill, Stirling.* [All the so-called *Geraniums* are really *Pelargoniums*. The wild *Cranesbills* of the fields are *Geraniums*. Eds.]

**The Pioneers of the Bedding-out System.**—In your last volume (p. 489) Mr. Fish states that the late Mr. Caie was the first person who commenced the bedding-out system, but this I beg to correct, as I helped to fill the beds here in the spring of 1823, long before Mr. Caie had charge of the Campden Hill gardens. It was Lady Grenville who began the bedding system in the first place, but she quite abhorred both ribbon and carpet bedding. The Dowager Duchess of Bedford used to visit the grounds here, and much admired the garden, and when she went to Campden Hill to live she sent Mr. Caie here to see the place, and very probably to take notes of what he saw. I had never seen Mr. Caie before, and never met him afterwards. *Philip Frost, Droghda.*

**Orchids at the York Nurseries.**—A considerable amount of care and attention has for many years past been given to these highly interesting, singular, and beautiful class of plants. They are mostly grown in low span-roofed houses, where the plants can be placed in such positions as to be near the glass, to obtain the greatest amount of light—a position which evidently suits them, as the large, vigorous masses of *Pescatoreas*, and the rare *Bolleas*, &c., abundantly prove. In passing through house after house filled almost to overflowing with the very choicest and rarest species and varieties, one feels no little difficulty which to notice amongst so many. Entering one of the ranges of the before-mentioned houses, the first sight which attracts the eye of the visitor is a splendid collection of the very chaste and captivating *Orchid*, *Laelia albida*, with its numerous varieties, varying as they do in colour from snow-white to those heavily suffused with purple. The blossoms of the typical form of *L. albida* are about an inch in diameter, pure white, waxy, and very firm in texture. They are borne on stout, nearly erect stems, with from five to twelve blossoms. The varieties *bella* and *grandiflora* are charming forms, the sepals and petals are more or less suffused with clear purple near the apex, while the lips are clear purple throughout, ornamented with a bright orange centre. Another gorgeous sight here rivets our attention. We are all well acquainted with the beauty of *Laelia anceps*, with its large, warm, rosy-purple flowers. However beautiful that may be, it is quite eclipsed both in size and colour by the very rare variety *Barkeriana*, which has blossoms fully  $4\frac{1}{2}$  inches in diameter, with sepals and petals of the most charming, brilliant rosy-purple, while the lip is of the richest velvet-crimson—which reminds me of a very old favourite, the double crimson *Primrose*, now so scarce. It is indeed an exquisite kind, and a valuable acquisition, and will, I feel sure, be much sought after by lovers of these plants. Advancing a few steps further, we are almost surrounded by splendid specimens of *Cattleya maxima*, with its enormous flowers, which are produced in considerable quantity, varying in colour and slightly in form from every shade of deep rosy-purple to almost white. My attention was drawn, while passing through another house, to a very interesting, singular, and very pleasing species of *Oncidium* with deliciously fragrant flowers. The individual blossoms are by no means large, but they are borne in considerable profusion on a dense branching spike about 12 inches long and half that across. The singularly pleasing feature in the appearance of the plant may possibly arise from the fact that the branchlets of the spike all stand off at right angles to the main stem, and the flowers are placed so close to each other upon two opposite sides of the stems as to form two distinct rows or lines. The blossoms are in colour a pleasing yellow more or less tinged with chocolate, and are about an inch across, with recurved sepals and petals. Altogether the plant is a very pleasing and attractive object. Messrs. Backhouse have not yet ascertained its specific name. It has all the appearance of proving a vigorous and free-growing kind. *Odontoglossum cirrosium* is another very fine species, with immense branching spikes bearing a profusion of beautiful white blossoms, irregularly but prettily spotted with brownish-purple; the sepals, petals, and lip have long acuminate twisted points, which give the flower a spider-like appearance. Another *Odontoglossum* was also conspicuous—*O. maculatum*, which is very distinct, having deep-green leaves with parallel longitudinal veins, and with large showy blossoms. The outer half of the sepals and petals is of a clear sulphur-yellow, while the inner half, that is the centre of the flower, is a similar colour, but heavily spotted or blotched with brownish-purple; the lip is triangular in form

and deeply jagged or toothed on the margin. It would occupy too much time and space to speak of the numerous other species now in, or showing flower of *Odontoglossum*, *Cypripediums*, *Dendrobiums*, &c.; but the large and magnificent specimens of *Odontoglossum Londesboroughianum* I cannot pass over without a remark. It throws up majestic arching stems bearing a dense spike of from eight to twenty handsome blossoms, each blossom being about  $1\frac{1}{2}$  inch in diameter, with a clear bright yellow lip, and with sepals and petals barred and spotted with brownish-purple. Amongst these there are several distinct and pleasing varieties, which are more or less spotted on the lips. *Oncidium tigrinum* v. *unguiculatum* is another vigorous and free-growing *Orchid* with branching stems 3 to 4 feet long, and bearing upwards of fifty yellow and brown flowers, which are very pleasing and conspicuous. A few paces from where this was growing I saw a nice batch of the true *Barkeria Lindleyana*, which was one of the most beautiful sights I have seen for a long time. It has short spikes of brilliant rosy-purple blossoms borne on slender stems 9 to 18 inches high, with six to twelve flowers on each stem. P.

**Plant Names.**—The Rev. C. W. Dod (see *Gardeners' Chronicle*, December 13, 1879, p. 767) is quite right in complaining about long names being given to garden plants. I agree with him that garden varieties ought to receive short names, if possible. It would seem preferable too to avoid Latin names for them, and if once a name is given to keep it, and not to translate it into another tongue; much confusion is caused sometimes by not doing so. I agree also with Mr. Dod when he wishes to avoid long Latin names for new *Daffodils*. It seems to me preferable to give to these new hybrids English short names, as in former years the large number of varieties of *Polyanthus Narcissus* were given vernacular names by the Dutch raisers. But when Mr. Dod, coming to Lilies, takes as example the *Schrymækersi Lily*, I think his example is not quite good. Allow me to say that this Lily is no new one, and not a Dutch variety, as far as I know; it has been cultivated here for years, and can now be supplied annually by thousands. This name therefore cannot be altered or shortened much. For Lilies till lately the rule was adopted generally to give them Latin names too, to indicate by Latin names varieties and sub-varieties. The reason of it is that only in later times has the number of varieties increased so much as to require common names. However, in Holland a hundred years ago the varieties of *Lilium Martagon*, *chalconicum*, &c., are found in Dutch catalogues with common names (these varieties are now lost for the greater part), so I have given recently to my new varieties of *Lilium umbellatum* the names of Dutch artists. Now for the *Lilium Schrymækersi*. This name being generally known, it would not be advisable to alter it. Perhaps *Lilium speciosum Schrymækersi* would have been sufficient, but as the name of *rubrum* is usually added, it seems to be preferable to write *Lilium speciosum rubrum Schrymækersi*. There seems no reason to say *atropurpureum Schrymækersi*, as the Lily belongs to the *rubrum* form, and *atropurpureum* being only a description of the flower. I mention this point to explain that if there has been an error in naming varieties with long Latin names the fault is not with Dutch gardeners. I suppose they were among those who first introduced Dutch and other common names for naming varieties, and in the old lists of Tulips of 1634, or of Hyacinths of 1734, in general only such names are to be found. For examples of long Latin names which had been better avoided one can find plenty in the list of flower seeds of late years. *J. H. Krelage, Haarlem, Holland, Dec. 24.*

**Orchids at Messrs. Veitch's, Chelsea.**—In looking through the collections of *Orchids* from time to time in these nurseries I have been struck with the numerous and beautiful examples of garden hybrids. Within the recollection of most of us some of the principal *Orchid* growers and fanciers persistently set their faces against hybridising *Orchids*, and I think the late Dr. Lindley and also Mr. Bateman may be mentioned as the most prominent names. But whatever ideas may have possessed growers, fanciers, and others, in the early days of this science, antagonistic to it, must have been expelled many years ago. The same feeling prevails to a certain extent in reference to crossing different species of herbaceous plants. An instance may be given in the case of the two hybrid *Aquilegias* raised at Loxford Hall—*A. cerulea* and *A. californica hybrida*. Ominous whispers were heard about the impropriety of crossing different species of *Aquilegia*, and that the scientific experiment was quite wrong in principle could be proved to a demonstration. [How? why?] But a demonstration was proved on the other side, when a group of these hybrids was exhibited in London last June, and hundreds of admirers crowded round them testifying to their beauty. The practical value of hybrid *Orchids* has been demonstrated in the same way.

Mr. Dominy, Messrs. Veitch's foreman, did not waste words or shed inky streams to prove that certain learned expositors were wrong; he produced *Cattleya exoniensis* ×, by crossing *C. Mossie* and *Laelia purpurata*. "There!" he says, "look at that *Orchid*. Its two parents are amongst the most beautiful and splendid of *Orchids*. They flower in June. I show you a distinct *Orchid* (species of *Orchid* it ought to be, for it is quite as distinct, specifically, as many imported species), quite as beautiful and splendid as its parents, but it gives you its wealth of magnificent flowers in September." Certainly there is no possibility of confuting a practical demonstration of that kind. At the time of my visit to Chelsea (December 22) *Dendrobium endocharis* × was in flower; this is a cross between *D. japonicum*, female, and *D. heterocarpum* as the male parent. Its sweetly-scented flowers, with pure white sepals and petals, are very pretty. The lip is brownish-purple, with rosy-purple lines at the base. It was exhibited last February before the Floral Committee, but was passed over as not worthy of a First-class Certificate. Only quite recently the very elegant *Oncidium ornithorhynchum albiflorum*, which also is very sweet, was passed over. Notwithstanding this, it is quite certain that both these *Orchids* deserve some mark of recognition. They will be sought after by many *Orchid* fanciers, and will be grown for their perfume, although their beauty is not so striking as a *Cattleya* or the more richly coloured *Dendrobiums*. *Laelia Schilleriana major* is a very splendid *Orchid*; it has the long, two-leaved growths of *L. elegans* or *L. Devoniana*. The flowers are large, pure white, with a broad purplish-crimson lip. Mr. Dominy believes that *L. elegans* is a natural hybrid, as it is so much like *L. Devoniana*. The *Orchids* alluded to a week or two ago are many of them still in flower, and the *Masdevallia tovarensis* had much improved; *Dendrochilum glumaceum* had in the interim expanded some graceful spikes of its delicately scented white flowers. Being a native of the Philippines, it requires heat when making its growth, but was flowering freely in a moderately cool house. *J. Douglas.*

**Fir-tree Oil.**—Pear and Plum trees are not unfrequently troubled with scale of different sorts which can only be effectually dealt with when the trees are in a leafless state. Various remedies for this and other tree pests have been put forth from time to time, some of which are decidedly unsafe in ordinary hands, and uncertain in their action at all times. In this category may be placed spirits of turpentine, every form of petroleum, and oils in general. The preparation called "Fir-tree oil," recently introduced to public notice by Mr. Griffith Hughes of Manchester, appears, however, to be an exception to this rule, as it mixes readily with water, and though it is very deadly in its effect upon insect life, it seems to be quite harmless to all but the most tender vegetation when used at a strength of half a pint to two gallons of water. It is a safe plan to try new remedies on a small scale at first—better make their acquaintance by degrees than bring about a disaster through misplaced confidence. *F. Harrison, Knowlesley.*

**Horticultural Boilers.**—One of your correspondents suggests that "horticultural builders possessing no special boiler of their own" should give their opinion on the various boilers used. Our experience is very like Mr. Lascelles' in this matter. We have no boiler of our own. We buy in the open market those boilers which we find give most satisfaction to our customers. As showing how the matter stands from this standpoint we cannot do better than give the number of the various boilers used by us during this year. We find from our books that from Jan. 1, 1879, to the present date (Dec. 23) we have fitted up altogether ninety-three boilers, consisting of forty-one terminal saddles (including two Gold Medal boilers), of the value £683 7s. 9d.; fifty plain saddles (including nine having cross tubes), of the value of £278 13s. 4d.; and two independent upright boilers (one of them a patent), of the value of £14 4s. We may state, in explanation of the great difference between the value of the forty-one terminals and fifty plain saddles, that for large quantities of piping we prefer the terminal, but for small quantities, 500 feet (4-inch) and under, we prefer the plain saddle. We find a long boiler, even though a plain saddle, more satisfactory than a short terminal. Your readers may depend upon it the whole secret of successful heating lies in a large long boiler and plenty of piping. We may state that we tested for our own satisfaction a terminal saddle against a patent boiler—which cost 33 per cent. more than the terminal, and which has been lauded to the skies for its economy and power—by joining both to the same system of piping, with valves to shut off the one while the other was being used. Each boiler was fired on alternate days, the coal used being weighed to a pound, the firing carried on as nearly as possible at set intervals by an experienced stoker, and the temperature taken every quarter of an hour, each boiler treated exactly alike—three thermometers inserted in the 4-inch pipe, the bulb

being about 1 inch down amongst the water; and the result of four days' trial of each that the highest temperature the patent boiler raised the water was to 129°—the highest with the terminal 175°. Exactly the same number of pounds of coal were used in each trial. Our opinion is that patent boilers are like patent medicines—99 per cent. quackery, 1 per cent. genuine. *Mackenzie & Moncur, Edinburgh.*

Foreign Correspondence.

ANTIBES: Dec. 24, 1879.—Frost in the South of France.—You may perhaps be interested in receiving an account of our garden of the Villa Thuret after the severe frosts of the month of December. The ill effects of the cold are always instructive, and prudent people know how to profit by them. On Dec. 2 the thermometer had already fallen to -4° Cent. (23° F.) in the lowest, and consequently the coldest part of the garden, and many of the plants suffered severely. Amongst others I may mention *Dahlia imperialis*, then in bloom; all the Mexican *Salvias*, the *Tecomas* and *Bignonias* of South Africa, the *Pithecoctenium*, *Pisonia hirtella*, *Helinus ovata* of Port Natal, with a number of *Stapelias*, and other fleshy plants. *Diospyros Kaki* had all its leaves injured by the frost as well as the fruit, which had not arrived at maturity. Nevertheless, this first frost was slight compared with that of Dec. 10, when the thermometer fell to -8° and -9° (15-17° F.) in the coldest part of the garden, and this time great harm was done even in the higher situation, where the cold did not exceed -4° or -5° (23°-24° F.). *Jacaranda mimosifolia* had all its leaves frozen; *Bougainvillea spectabilis*, on the southern side of the house, and consequently very sheltered, was terribly injured: all the young shoots are destroyed, and probably it will not flower next summer. The damage has not been less among the plants of the Canaries—the *Sempervivums*, in particular, are ruined, and will scarcely recover. I pass over in silence many other less remarkable plants, but all have been equally ill-treated.

Side by side with these dead and wounded I am surprised to see other plants which one would have believed equally liable to injury, but which have not been damaged in the least. Most of the cactiform *Euphorbias* (*E. canariensis*, *E. resinifera*, &c.), the *Opuntias*, *Echinocacti*, *Cereus*, *Manillarias*, many *Aloes*, amongst these the beautiful *Aloe Hanburyana* (or *roseo-cincta*) nearly all the *Agaves*, &c., have been spared. Not less surprising is the fact that one side of some plants has been completely killed, while the other has escaped altogether. Also of two specimens of the same species, almost side by side, one has perished while the other has not lost a leaf. These phenomena seem to be explained by the supposition that the various currents of air to which the plants are exposed are not all of the same temperature, so that two currents, one cold, the other comparatively warm, travel side by side without mingling, and thus it follows that the one must be injurious, the other harmless. If the draughts of air of different temperatures could be coloured in any way one would be able to see at a glance the cause of these anomalies.

The Palms have, as a rule, resisted the cold well. One of the most hardy, and therefore it must be noticed, is *Cocos australis*, of South America, which in all exposures has retained unhurt its beautiful glaucous verdure. This Palm seems to me as hardy as *Jubaea* and more so than *Pritchardia filamentosa*, of which the leaves have suffered slightly. The large *Eucalyptus globulus* has not suffered, but *E. melliodora* and some others have lost a part of their leaves. According to news I have received, the cold has been terrible in Paris: they speak of -25° (-13° F.)—a cold equal to that of Russia. The *Jardin des Plantes* has had some cruel losses, and they will count them by hundreds. Even the native plants have felt it, and some are seen that have been split by the cold the entire length of their stems. *Ch. Naudin.*

THE URARI POISON.—Dr. Schomburgk has lately published in pamphlet form a *resumé* of all that is known concerning the deadly arrow-poison used by certain tribes in British Guiana. Dr. Schomburgk gives the personal experience of his brother and himself, and adds a summary of the information obtained by other travellers, as well as by chemists and physicians. The essential ingredient consists in the bark of various species of *Strychnos*, nevertheless the presence of strychnin has not been detected, neither are the effects produced those that are characteristic of that drug. In fact, urari has been used as an antidote to strychnin, and as a sedative in cases of tetanus and rabies; but the uncertain and varying composition of the drug, and the difficulty of procuring it, must for a time prevent its successful use on a large scale.

Obituary.

WE have to record—we can scarcely say with sorrow—the death of Mr. GEORGE ROLLISSON, in his eightieth year. His decease took place at Grove Villas, Balham, on December 15, and may be said to have been a happy release from a state of paralysis and unconsciousness in which he had been lying for the long period of fourteen years—long enough, fortunately, for him to have been in ignorance of the recent break-up of the world-famed establishment, of which he had once been one of the chiefs. Mr. G. Rollisson was the elder of the two sons of the founder of the Tooting Nursery, by whom the business was carried on for very many years after their father's death, and under whose auspices it acquired a great reputation for the successful cultivation, as well as the raising, of new and valuable varieties of Heaths, also for the introduction and cultivation of Orchids, and the importation and dissemination of new plants. In the days to which we allude, the Tooting nursery—Tooting is but a suburb of London—ranked as one of the most important plant nurseries of the metropolis; but now both it and the aged members of the firm have passed away, the younger of the two, Mr. W. Rollisson, having predeceased his brother in 1875. The gentleman whose decease we now record was esteemed for his amiable, kind-hearted, and generous disposition, and his memory will be feelingly cherished by all those who knew him.

— Of Mr. JOHN HALLY, formerly of Blackheath, whose death was briefly noted last week, we may mention that he was for many years proprietor of the Blackheath Nursery, and was well known as a grower of *Camellias*, *Pelargoniums*, &c. He was a member of the National Floricultural Society, an active floral body whose business it was to afford florists and the raisers of novelties an opportunity to bring them before the public, and out of the ashes of which the Royal Horticultural Society's Floral Committee may be said to have sprung. We find that in 1861-62 he was amongst the earlier contributors of new Zonal *Pelargoniums* to the trial collections at Chiswick; in the former year *Blackheath Beauty*, a salmon-pink of his raising, was amongst the kinds selected for approval, and in 1862 another of his novelties, *Adonis*, a zonal scarlet, was selected for a First-class Certificate. Mr. Hally died at Arundel on December 21, in the eighty-first year of his age.

The Weather.

Dec. 24.—A fine bright day. Frosty in morning and evening. Hoar frost. Cold. Fog in morning.  
 — 25.—A very miserable damp day. Thick black fog throughout. Very dark. Artificial light required nearly the whole of the day.  
 — 26.—A cold dull day. Sharp frost at night. No fog.  
 — 27.—Dull in morning, then fine till evening; dull at night. Hoar frost. Cold. The temperature rose at night.  
 — 28.—A rapid and decided thaw. Quite warm. Damp. Mizzling rain. A very strong wind. The maximum temperature occurred at midnight (+52°).  
 — 29.—A fine bright day. Thaw continued. A very strong wind. Cloudless at night.  
 — 30.—Frequent heavy showers of rain in morning and afternoon. Cloudless at night. Thunder and lightning with hail at 1 P.M. A strong gale of wind. Cool day.  
 — 31.—Overcast, dull, and wet throughout. Mild. Strong wind. The maximum temperature—viz., 52°—occurred at midnight.

NOTE.—The severe cold weather which set in on November 20 continued until December 27—a period of thirty-eight days. The mean temperature of the air for these thirty-eight days was 31°, being 9.7° below the average from sixty years' observations.

LONDON: *Barometer*.—During the week ending Saturday, December 27, in the vicinity of London the reading of the barometer at the level of the sea decreased from 30.45 inches at the beginning of the week to 30.35 inches by the evening of the 21st, increased rapidly to 30.80 inches by the morning of the 23d, decreased to 30.42 inches by the afternoon of the 24th, increased to 30.60 inches by the morning of the 25th, and decreased to 30.27 inches by the end of the week. The mean reading for the week at sea level was 30.52 inches, being 0.02 inch below that of the preceding week, and 0.47 inch above the average. The mean daily readings were above their averages throughout the week; the greatest departures in excess were 0.60 inch on the 22d, and 0.67 inch on the 23d.

*Temperature*.—The highest temperatures of the air observed by day varied from 42° on the 22d to 32° both on the 21st and 26th; the mean value for the week was 36½°. The lowest temperatures of the air observed by night varied from 21½° on the 24th to 29° on the 25th; the mean value for the week was 26½°. The mean daily range of temperature in the week was 10½°; the greatest range in the day being 18°, on the 24th, and the least 5°, on the 26th.

The mean daily temperatures of the air and the departures from their respective averages were as follows:—Dec. 21, 28°·6, -10°·7; 22d, 35°·9, -2°·9; 23d, 31°·8, -6°·6; 24th, 32°·5, -5°·7; 25th, 32°·4, -5°·6; 26th, 29°·5, -8°·3; 27th, 32°·2, -5°·4. The mean temperature of the air for the week was 31°·8, being 6°·5 below the average of sixty years' observations.

The highest readings of a thermometer with blackened bulb in vacuo, placed in the sun's rays, were 64° on the 24th, and 49° on the 22d; on the 21st and 26th the readings did not rise above 35°. The lowest readings of a thermometer on grass, with its bulb exposed to the sky, were 21° on the 24th, and 23° on the 21st; the mean of the seven lowest readings was 24°.

*Wind*.—The direction of the wind was variable, and its motion almost calm. The weather during the week was very dull, dark, and the sky cloudy. The air was very still, very cold, and sharp frosts were experienced. Fog and hoar frosts were prevalent throughout the week, the fog being unusually dense on the 22d and 25th.

ENGLAND: *Temperature*.—During the week ending Saturday, December 27, the highest temperatures of the air observed by day were above 50° at Truro,

Liverpool, and Sunderland; and below 41° at both Norwich and Wolverhampton; the mean value from all places was 45½°. The lowest temperatures of the air observed by night were below 25½° at Truro, Brighton, Bristol, Blackheath (London), Cambridge, Norwich, Nottingham, Sheffield, Hull, Bradford, and Leeds; and above 27° at Liverpool and Sunderland. The general mean from all stations was 25°. The extreme range of temperature in the week was above 25° at Truro and Liverpool, and below 18° at Norwich, Wolverhampton, and Hull; the mean range of temperature from all stations was 20½°.

The mean of the seven high day temperatures was above 45° at Truro and Plymouth, and below 37° at Blackheath (London), Cambridge, Norwich, Wolverhampton, and Hull; the mean from all places was 40½°. The mean of the seven low night temperatures was below 28° at Blackheath (London), Cambridge, Norwich, Wolverhampton, and Nottingham; and above 32½° at Truro, Plymouth, and Sunderland; the mean from all stations was 29½°. The mean daily range of temperature in the week was above 12° at Truro, Plymouth, Bristol, and Liverpool, and below 9° at Cambridge, Norwich, and Hull; the mean daily range from all places was 10½°.

The mean temperature of the air for the week from all stations was 35°, being 3½° higher than the value for the corresponding week in 1878. The mean temperature was above 30° at Truro, Plymouth, and Sunderland; and below 32° at Blackheath, Cambridge, Norwich, and Wolverhampton.

Rain.—The amounts of rain measured were small everywhere. The greatest falls were three-tenths of an inch at Truro and Hull, and the least falls were one-hundredth of an inch at Nottingham and Sunderland; at Norwich, Bradford, and Leeds no rain was measured; the average fall over the country was one-tenth of an inch.

The weather during the week was still very cold and dry. The sky was generally cloudy, and very dense fogs were frequently prevalent.

SCOTLAND: Temperature.—During the week ending Saturday, December 27, the highest temperatures of the air observed by day varied from 55½° at Aberdeen, to 49½° at Edinburgh; the mean value from all stations was 51½°. The lowest temperatures of the air observed by night varied from 25° at Edinburgh, to 31° at Paisley; the mean value from all places was 28½°. The mean range of temperature in the week from all places was 23°.

The mean temperature of the air for the week from all stations was 39½°, being 10° higher than the value for the corresponding week in 1878. The mean temperature was the highest at Paisley and Leith, 40½°, and the lowest at Aberdeen and Perth, 39°.

Rain.—The amount of rain measured at Greenock was 1¼ inch, whilst at Aberdeen only four-hundredths of an inch fell, and at Perth no rain was measured; the average amount over the country was half an inch nearly.

DUBLIN.—The highest temperature of the air was 52½°, the lowest 23½°, the extreme range 28½°, the mean 43°, and the fall of rain 0.39 inch.

JAMES GLAISHER, F.R.S.

Enquiries.

He that questioneth much shall learn much.—BACON.

BAROMETRIC AL REGISTERS.—I am anxious to obtain the name and address of a printer who supplies monthly sheets for registering the barometer, &c. The sheets I mean are similar to those in use for the self-registering barometers. Will some of your correspondents kindly give the desired information? R. R.

COMPENSATION.—A Correspondent writes:—A Railway Company proposes to extend its line through one of my best fields which I have taken on a lease of twenty-one years, and I am bound by covenants to plant the same as a plantation within two years. Can I charge the company my profits for the whole twenty-one years as a plantation, or what would be a fair claim? I am paying £5 per acre for the land besides tithes and rates, &c., and am bound to find the trees myself. The land is under fruit and vegetable cultivation for market.

MARKET GARDENING.—Having a small piece of ground to be used for market gardening purposes, I should like to know how best to utilise it as regards kitchen garden crops, so as to obtain the best results. What would be the best varieties of Cabbage, or other vegetables, that might be planted at once, or within a few weeks' time? A Subscriber.

ROSES FOR MARKET.—I have a Maréchal Niel house, half-span, south aspect, 100 feet by 12 feet; apex 10 feet high; front wall, 2 feet, heated with 2 pipes; Roses planted against back wall and two-thirds up front rafters; the back and front borders are free. What can be grown under the Roses for market, to pay? Would any other Roses pay better than Maréchal Niel? C. G.

THE PINE BEETLE.—Can you tell me whether there is any known cure for the grub that destroys the tips of the shoots of Pinus insignis? C. Halford Thompson. We believe not. Encourage the birds. Eds.

Answers to Correspondents.

DISEASED PEAR TREES: S. M. & A. Without an examination of the trees themselves, it is scarcely possible to give a good opinion. Young shoots are often exactly in this condition where either the lower portions are cankered or the soil does not suit. There is no appearance of fungi on the shoots. We have Pear trees almost in the same condition from the cause above stated. M. J. B.

GARDENERS' BENEFIT SOCIETIES: E. Hoep. We do not know of any besides the Gardeners' Royal Benevolent Institution (Secretary, Mr. E. R. Cutler, 14, Tavistock Street, Covent Garden, W.C.), and the United Gardeners' Benefit Society (Secretary, Mr. McElroy, Moray Lodge, Campden Hill, Kensington).

GRAFTED VINES: E. A. The precise influence of the stock upon the scion amongst Grapes is very imperfectly ascertained or understood as yet. There is no evidence of one variety succeeding better than another. It must be purely a matter of experiment for yourself. The Mill Hill Hamburg and Muscat Hamburg are both good, but tastes differs—Chacun à son goût.

HERACLEUM GIGANTEUM: H. B. The seeds of this free-growing, hardy plant, may be sown as soon as the seed ripens, or in spring. It grows from 6 feet to 10 feet or more in height; the flowers are white.

IVY ON WALLS: Hedera. If your wall is sound, and in good order, the Ivy will do no harm, but rather good. If the wall is dilapidated, it is another matter.

MUSHROOMS: H. L. Send us a sample of the Mushrooms and vermin.

NAMES OF FRUIT: W. M., Romford. The Pears are shrivelled and unripe, and so much out of character that we can do nothing with them.—Middlesea. Your Grape is the Buckland Sweetwater.—H. L. Pear: Uvedale's St. Germain. Apples not recognised.

NAMES OF PLANTS: H. Pottu. Your plants are probably—1, Juniperus Bedfordiana; 2, Cupressus funebris; 3, Cupressus lusitanica.—Dinné tuathach. The leguminous plant is Parochæta communis; the other Senecio milkanoides.—Geo. Hall. The specimen was smashed when it arrived in indeterminable bits; send another, and pack it better.—A. B. 1, Strelitzia regina; 2, send again; 3, indeterminable without flowers; 4, Scutellaria Mociniana.—G. C. Buecharis trinervis, male plant.—W. H. Poynter. Browallia demissa, a native of tropical America, not of Zululand. See Bot. Mag., t. 1136.

PEAT: Anon. The sample of peat you send appears to be sound and wholesome, containing a large proportion of vegetable matter. If mixed with turfy loam and plenty of coarse grit we should suppose that Laperagerias would grow well in it, and so would Ixoras, Gardenias, or Ferns; but the drainage must be effectual. Azaleas require a harder kind of peat.

PLANTS FOR CONSERVATORY: H. E. You cannot do better than plant climbing Devonensis Rose, which should do very well in the position indicated. Give it good loamy soil, and keep it well fed. For the other subject we should recommend Jasminum azoricum or grandiflorum, Tacsonia Van Volkemii, Passiflora Impératrice Eugénie.

PRIMULAS: H. Tail & Co. The flowers arrived in a wretched condition, through being badly packed—in cotton-wool. They appear to be of an average good strain.

STEPHANOTIS: C. E. O. No wonder the plant is sick. The leaves received are in a filthy condition with scale, mealy-bug, and dirt. The plant wants a thorough washing to commence with; perhaps fresh potting, or top-dressing if planted out, and a stronger heat than is applied to an ordinary conservatory.

FOREIGN SUBSCRIBERS sending Post-office Orders are requested to make them payable at the post-office, King Street, Covent Garden, London, and at the same time to inform the Publisher at the office of this Journal.

CATALOGUES RECEIVED:—Downie & Laird (17, South Frederick Street, Edinburgh), Descriptive Catalogue of Garden, Flower, and Agricultural Seeds, Gladioli Roots, Implements, &c.—Messrs. J. Veitch & Sons (Royal Exotic Nursery, King's Road, Chelsea), Catalogue of Garden and Flower Seeds, Implements, &c.—B. S. Williams (Upper Holloway, London, N.), Descriptive Catalogue of Flower, Vegetable, and Agricultural Seeds, &c.—Messrs. Osborn & Sons (The Fulham Nurseries, London, S.W.), Catalogue of Kitchen Garden and Flower Seeds, &c.—Messrs. Dickson & Robinson (12, Old Millgate, Manchester), Priced Descriptive Catalogue of Select Vegetable and Flower Seeds.

DIED, on the 1st inst., at The Nurseries, Wandsworth Common, ROBERT NEAL, Sen., aged seventy-eight.

Markets.

COVENT GARDEN, January 1.

We are now at a complete standstill, and all classes of goods are much depreciated in value by the present thaw. A large consignment of American Apples reached us during the week, but in inferior condition. Good samples of Grapes are in better demand. James Heber, Wholesale Apple Market.

Table with columns for FRUIT and prices for Apples, Lemons, Oranges, Pears, Pine-apples, Cob Nuts, and Muscat.

Table with columns for VEGETABLES and prices for Artichokes, Asparagus, Beans, Beet, Brussels Sprouts, Cabbages, Carrots, Cauliflowers, Celery, Chilis, Cucumbers, Endive, Garlic, Herbs, Horse Radish, Lettuce, Mint, Onions, Parsley, Peas, Potatoes, Spinach, Tomatoes, Turnips.

Potatoes.—Regents, 100s to 145s.; Flukes, 120s. to 150s.; and Champions, 130s to 150s. per t n. The large supplies received from Germany are making from 4s. to 7s. per bag.

Table with columns for CUT FLOWERS and prices for Abutilon, Arum Lilies, Azalea, Bouvardias, Camelfias, Carnations, Chrysanthemum, Cyclamen, Euphyllium, Eucharis, Gardenias, Heliotropes, Hyacinths, Lily of Val, Nigmonette, Narcissus, Pelargoniums, Poinsettia, Primula, Roses, Spirea, Tropæolum, Tuberoses, Violets, White Lilac.

Table with columns for PLANTS IN POTS and prices for Arum Lilies, Azaleas, Begonias, Bouvardias, Chrysanthemums, Cinerarias, Cyclamen, Cyperus, Dracæna terminalis, Erica gracilis, Euonymus, Ferns, Ficus elastica, Foliage Plants, Fuchsias, Hyacinths, Myrtles, Palms, Pelargoniums, Poinsettia, Primula, Solanum, Tulips.

SEEDS.

LONDON: Dec. 31.—To-day, being the last market of the year, the attendance of buyers, as was to be expected, was very limited, and the business doing was as nearly nil as possible. Notwithstanding, however, the quiet feeling which has recently prevailed, the seed trade maintains a firm position, and a fair amount of activity early next month may reasonably be expected. As regards red Clover seed the situation is unchanged: of new English there is absolutely none, whilst choice foreign continues scarce. The total shipments from New York since August 15, 1879, until December 19, 1879, have been as follows:—To the United Kingdom, 25,391 bags; to the Continent of Europe, 42,588 bags. White Clover has lately been in greater favour; and, as the wretched yield of the German crop has become more apparent, values have in consequence materially advanced. Alsike also at current rates is regarded as thorough good value. Compared with the average of former years Trefoil is undoubtedly now very dear; but against this is its extreme scarcity, and also the important facts that no overwhelming importations can come from America, and that the small quantity on hand is strongly held. The inquiry which has sprung up during the last few weeks for Italian Rye-grass has revealed a surprising shortness of stocks, and as a result of this a steady upward movement has been in progress: in spite, however, of the rise which has been established, to-day's quotation for fine seed, say, about a guinea per cwt., is moderate. Perennials are unchanged. In the absence of transactions there is nothing to be said concerning Hemp, Canary, Millet, or Rape seed. The extremely low rates at which Tares are now obtainable have stimulated some business therein. Haricots, Lentils, and Peas maintain last week's currencies. John Shaw & Sons, Seed Merchants, 37, Mark Lane, London, E.C.

Government Stock.—On Monday the closing price for Consols was 97½ to 97½, for both the account and delivery. There was no alteration in the final figures of Tuesday. Wednesday's closing price was 97½ to 97½, for delivery and account. Thursday being New Year's Day, the Stock Exchange was closed.

THE OLDEST HOUSE IN THE TRADE.

| "THE RED PASTE BALLS," for Conditioning Horses.                                       | "THE CARMINATIVE CHALK," for Diarrhoea in Lambs and Calves.      |

PRICE OF CHEST, with GUIDE to FARRIERY .. .. . £2 16s. 6d.

No. 1 COMPLETE MEDICINE CHEST, £6 6s., Carriage Paid.

*USED FOR OVER FORTY YEARS THROUGHOUT THE UNITED KINGDOM AND THE BRITISH COLONIES.*

THE KOSSOLIAN SALT OR BLOOD SALT,

FOR HORSES, COWS, OXEN, SHEEP, AND CALVES.

Its saline and ferruginous elements prevent langour, exhaustion, want of energy, and loss of appetite. All animals should have an ounce or two of the KOSSOLIAN or BLOOD SALT mixed with their food once or twice a week, from the hunter down to the carriage horse and hack. All young animals, whether colt, calf, or lamb, should have half an ounce of the KOSSOLIAN or BLOOD SALT mixed with their food, for it is a safeguard against contagious diseases, and it is destructive to the parasites in the bronchial tubes, causing that distressing malady the Hoose or Husk. It converts the food, while in the stomach, rapidly into flesh and bone making elements, and gives a firmness to the flesh to resist all poisonous effluvia; and it also renders all animals capable of enduring with safety the heat of summer, and the cold rains and sleet of winter.

Sold in Boxes, containing one dozen packets, price 12s. Beware of Imitations.

DAY, SON, & HEWITT,

22, DORSET STREET, BAKER STREET, LONDON, W., and WANTAGE, BERKS.

ESTABLISHED! 1834.

# CLAY'S FERTILISER, OR PLANT FOOD.

Is now largely used by the principal Nurserymen, Market Growers and Gardeners throughout the United Kingdom, and is admitted by them to be the cheapest, safest, and best Manure.

The fact that One Hundred of the most celebrated Plant Growers in the world have allowed their names to be published as references, should be sufficient to convince the most sceptical.

## CLAY'S FERTILISER

Is the best Manure for VINES.

GYDE'S  
IMPERIAL FERTILISER

AND  
AMAZONAS SANA COPIA  
POTATO MANURE

FOR  
Flowers, Fruit, & Vegetables.

Established 1839.

40  
YEARS  
of

INCREASING SUCCESS.

Perfection in Artificial Manures for all Plants on British Soil and Conservatories.

Numerous Testimonials from all parts of the Kingdom justify us in stating that our different Manures and Plant Foods are perfect. Testimonials confirm the Analyst's favourable opinions given below.

GYDE'S AMAZONAS SANA COPIA  
POTATO MANURE

Will prevent disease to sound seedlings, and will double the yield.

GYDE'S IMPERIAL FERTILISER,

A highly-concentrated Manure, is admitted by all practical Men who have tried it to be the very best ever offered to the public.

It gives bloom and vigour to Flowers, abundant growth to Vegetables, size and aroma to Strawberries, and fertility to all.

Copies of confirmatory Testimonials will be sent on application to the Manager.

ANALYTICAL REPORTS.

"In this Manure the Phosphates are present in a Bone Material, and a large proportion of the Ammonia is ready-formed Ammonia, and, judging from its composition and fine state of preparation, should prove most valuable for Horticultural purposes.—JOS. CRIPPS, formerly Senior Assistant to Dr. Veecher." Date, June 19, 1879.

"I have carefully examined Gyde's Imperial Fertiliser, and from the results shown by analysis it must prove a very efficient Manure for Horticultural purposes—one which will not only stimulate the growth of the plant, but carry it on through its various stages unto perfection.—D. BATCHELOR, Analytical Chemist." Date, June 20, 1879.

RESPONSIBLE AGENTS WANTED.

1 cwt., 16s.; ½ cwt., 9s. 6d.; ¼ cwt., 7s.;

**COALS FOR HOTHOUSE PURPOSES.**

**WOOD AND CO.'S STAR ANTHRACITE SMOKELESS STEAM COAL**  
 is now being extensively used by many of the principal Growers, and is found to be preferable to any other kind of fuel in respect to cheapness and durability, and particularly on account of its being perfectly free from sulphur, and that it does not clinker the fire-bars.  
 WOOD AND CO. deliver in truckloads to any Railway Station, prices for which can be had on application, or can be delivered by Wood & Co.'s Vans (in the Metropolis).  
 WOOD AND CO. append a testimonial given to them by Messrs. Beckwith & Sons, a firm of great experience, and who have kindly allowed them to make whatever use of it they may think fit.

Tottenham Nurseries, London, N., Dec. 28, 1877.  
 To Messrs. Wood & Co.  
 Dear Sirs,—With reference to your enquiry respecting the "Star" Anthracite Coal with which you supplied us—as to how it suited, its economy or otherwise—we have much pleasure in informing you that in every respect it is the best Anthracite we have ever used. We find there is no smoke from it, which is very essential, and there is no trace of sulphur. It requires very little stoking, and leaves very little ash, and certainly does not clinker. Our consumption of coal is about 500 tons a year, and we have no hesitation in saying that, by using your "Star" Coal in the place of ordinary fuel, we shall effect a saving of at least £100 this year. We attribute this to the powerful and lasting properties of your Coal.—Yours faithfully,  
 (Signed) G. BECKWITH & SONS.  
 WOOD AND CO. supply all kinds of Coal for House and Manufacturing purposes, in single truckloads, to any Railway Station, at Wholesale rates, prices for which will be sent on application.  
 WOOD AND CO., Coal and Coke Factors, Merchants, Contractors to Her Majesty's Government, 58, Coal Exchange, E.C.; and 4, Coal Department, Great Northern Railway, King's Cross, N.; and Midland Sidings, St. Pancras, N.W.; 94, High Street, Kensington; London, Chatham and Dover Railway Coal Depot, Elephant and Castle; and Great Northern Railway Coal Depot, Sydney Road, Hackney Wick, E.

**HELLIWELL'S PATENT**

All outside Wood is covered. No Painting Required. Cost of House Saved in Ten Years. No Rattle or Looseness of Squares. No Breakage from Expansion or Contraction. Squares instantly replaced. TESTIMONIALS.—"Sir: I went yesterday and examined the glass roof glazed by you, under my directions, at Sandringham, for H.R.H. the Prince of Wales, and find it perfectly satisfactory in all respects. The appearance is vastly superior to the old system of wood and putty, and I shall be glad to recommend it whenever I can. Yours faithfully (Signed) C. Smedley Beck, Architect. T. W. Helliwell, Esq."—"Mark Lane, London, Nov. 14, 1878. Dear Sir: I cannot see what Testimonial you can require from me, than the fact that I have taken off all my putty glazings, and removed —'s work to replace it with yours. Any one seeing the two systems would say that yours is far the superior, and that nothing yet out can touch it. Yours, W. R. Preston. T. W. Helliwell, Esq., Brighouse." For Estimates, Drawings, or Particulars, apply to the Patentee, T. W. HELLIWELL, Brighouse, Yorkshire.

**BOOTE AND MILLSON, LEAD and GLASS** MERCHANTS, 64, City Road, E.C., have always on the PREMISES a large Stock of all kinds of Horticultural Glass, at lowest market rates.

# SALÁP MISREE,

OR

## PERSIAN FOOD FOR INFANTS AND INVALIDS

(REGISTERED).

Of all amylaceous or farinaceous substances this will be found THE most Nutritious and Strengthening. As an article of daily food it is excellent, but in Convalescence from ANY form of Disease, either in Adults or Infants, it is INVALUABLE.

In Atrophy or wasting disease in Children there is no food to be compared with it, inasmuch as it contains a very large percentage of those properties requisite to repair and build up the wasted structures of the

body, and therefore only requires to be given in small quantities. It supersedes Medicinal Tonics, which in extreme cases of Debility frequently do more harm than good, on account of there being generally great irritability of the Stomach.

This preparation is absolutely free from the admixture of any farinaceous substance. It is guaranteed perfectly PURE, and may safely be taken by the weakest Infant or most aged Invalid.

*Its beneficial properties may be summed up as follows:—*

**It is highly nutritious.**

**Its nutrient and strengthening properties are in a condensed or concentrated form.**

**Is most easy of Digestion.**

**Is alike agreeable to young or old.**

**Is a non-irritating Tonic.**

**OPINION of W. B. O'SHAUGHNESSY, M.D., F.R.S., &c.**

Dental Medical Service,

Late Professor of Chemistry and Materia Medica in the Medical College, Calcutta, East India.

"Two drachms afford a sufficient meal for an Invalid. Good Sakáp Misree, properly prepared, is in truth one of the best articles of diet a Convalescent can use."

**FOR ATHLETES.**—Those in training for Rowing, Racing, or Bicycling will find this a most excellent diet, as it is essentially a muscle invigorator and producer.

It is recommended by many of the most eminent Members of the Medical Profession.

For Directions see Label on the Bottle.

PUBLISHING OFFICE AND OFFICE FOR ADVERTISEMENTS, 41, Wellington Street, Strand, London, W.C.

WANTED, in a Small Nursery, an active GARDENER, who thoroughly understands Growing Plants and Cut Flowers for Market. Must be a good Planter and Grafter of Roses, and successful Propagator of Soft-wooded Plants. Also a competent Man (married preferred) to Grow Vegetables, Fruit, Herbaceous Plants, and Outdoor Roses.—Apply by letter to C. CLEMENTS AND CO., Oak Farm Nursery, Chigwell, Essex.

WANTED, a SINGLE-HANDED GARDENER, in a situation about 20 miles from London. Flower and Kitchen Garden, Greenhouses, hot and cold. Single man preferred.—Apply by post, stating age, last situation, and salary required, to S. P., Mr. Bedford, 26, Change Alley, London, E.C.

WANTED, an experienced reliable Man as FOREMAN and MANAGER in a Nursery where choice Flowers and Plants are grown for Market Trade. Wages not so much an object as an energetic, competent, and trustworthy man.—Mr. G. STRUTTON, Baker's Farm Nursery, Harlesden Green, Willesden, N.W.

WANTED, as NURSERY FOREMAN, an active industrious young Man (single) for Outdoor Department. Must be steady, sober, honest, and have a good knowledge of Propagating and Growing a General Collection of Hardy Ornamental Trees and Shrubs, and Fruit Trees.—Apply by letter only, stating wages, including both, fuel and light, to IRELAND and THOMSON, Craighleith Nursery, Comely Bank, Edinburgh.

WANTED a PROPAGATOR, indoors, who thoroughly understands the Propagation of Rhododendrons, Roses, and Conifers, Hardy Trees, and Shrubs under Glass. Liberal Wages to an experienced Man with good reference; a cottage or comfortable lodgings on the premises.—Apply by letter, with particulars, to EDWIN HOLLAMBY, Groombridge, Tunbridge Wells.

WANTED, a GROWER of Soft-wooded Plants—one that has grown for Market preferred.—Apply to R. CHILDS, Elenheim Nursery, Rye Lane, Peckham, S.E.

WANTED, a respectable Young MAN, age 18 to 20, accustomed to Grow for Market. To live in house. A comfortable home for a steady man.—W. T. CHILD, Avenue Nursery, Acton.

WANTED, a steady, respectable Youth as APPRENTICE in the Seed Business. Good references required.—Apply to E. WILSON SERPELL, 27, Corn-wall Street, Plymouth.

To the Seed Trade.

WANTED, as SHOPMAN, for a Provincial House in Ireland, a young Man accustomed to the General Retail Trade, and if with a knowledge of the Nursery Trade it would be an advantage (but not absolutely necessary)—State full particulars as to experience, where last employed, and salary expected, to B. W., *Gardeners' Chronicle* Office, W.C.

WANTED, as SHOPMAN (SINGLE-HANDED), a young Man, capable of taking Charge of a Seed and Florist's Shop in a Provincial Town. Must be well recommended from previous employer as to character and ability. None but thoroughly competent men need apply.—JOHN TUCKER, High Street, Bridgwater.

WANTED, an ASSISTANT SHOPMAN for a good Provincial House. Must be quick at Counter Work, and of good address.—Apply, stating age, experience, and salary required with board and lodging, to SEEDSMAN, Mr. R. Cooper, 90, Southwark Street, London, S.E.

WANTED, a JUNIOR ASSISTANT, in the Seed Trade, for a Provincial House.—Apply, with references and full particulars, by letter only, to N., Messrs. Bolton & Co., Seed Merchants, Wood Green, London.

WANT PLACES.

DOWNIE and LAIRD can at present recommend with every confidence several first-rate SCOTCH GARDENERS, whose character and abilities may be thoroughly depended upon, either for Large Establishments or Single-handed Situations; also FOREMEN, UNDER GARDENERS, and FARM BAILIFFS.—17, Frederick Street, Edinburgh.

B. S. WILLIAMS begs to intimate that he has at present in the Nursery and upon his Register some excellent Men, competent either to fill the situation of HEAD GARDENER, BAILIFF, FOREMAN, or JOURNEYMAN. Ladies and Gentlemen requiring any of the above will please send full particulars, when the best selections for the different capacities will be made.—Holloway, N.

TO GENTLEMEN and MARKET GROWERS.—ADVERTISER is prepared to Work up a Connection, and Establish and Manage a Business for a Gentleman with capital, intending Growing, for Trade purposes only, Grapes, Peaches, Strawberries, Mushrooms, Cucumbers, &c., also choice Cut Blooms. First-class references.—HORTUS, 5, Duffield Street, Battersea, S.W.

TO SANITARY AUTHORITIES.—JAS. MYATT, Market Gardener, is prepared to undertake the Management of a Sewage Farm, and will be happy to treat, by letter in the first instance, with the representative of Local Towns.—JAMES MYATT, Myland, Colchester.

GARDENER (HEAD).—Age 30; can be highly recommended. Reference—Mr. Odley, Daylesford Gardens, Chipping Norton, Oxon.—C. SPALL, 11, Mexican Terrace, Caledonian Road, King's Cross, N.

GARDENER (HEAD).—Age 31; thorough good Grower of Fruit, Flowers, and Vegetables. His mother and sister excellent landresses. Highest references.—11, Furley Street, Goldsmith Road, Peckham, S.E.

GARDENER (HEAD), to any Nobleman or Gentleman.—Age 34, married, two children; thorough knowledge of the profession in all its branches. First-class references.—GARDENER, Leyland, near Preston, Lancashire.

GARDENER (HEAD).—Married, no family; thoroughly practical. No Single-handed place accepted. Highly recommended from present and previous situations.—J. Mr. Edmonds, Broad Street, Hereford.

GARDENER (HEAD).—Age 30; has a good knowledge in the different departments of Gardening; 14 years' experience—4 years as Foreman in present situation.—E. DOLBY, Alton Towers, Stoke-on-Trent.

GARDENER (HEAD), to any Nobleman or Gentleman requiring the services of a Man thoroughly practical in all branches of Horticulture in large establishments, where Fruits, Flowers, and Vegetables are grown extensively. Married, no incumbrance.—X., 16, Springfield Cottages, Highgate, London, N.

GARDENER (HEAD); age 30.—W. DAVIDSON, Gardener to the Earl of Harrowby, Sandon Hall, Stone, Staffordshire, will be pleased to recommend S. BROWN to any Lady or Gentleman requiring a thorough practical and energetic man, who has been here as principal Foreman for four years, with credit to himself and to my entire satisfaction.

GARDENER (HEAD, WORKING).—Age 28; thoroughly practical in every branch. Fourteen years' experience. Excellent character from present situation.—G. S., The Gardens, Crawley Court, Winchester.

GARDENER (HEAD, WORKING), where several men are kept.—Age 30, married, no family; experienced in every department. Three and a half years' excellent character from present employer.—Apply, stating wages, &c., to F. A. GOODE, the Gardener, Ashstead Park, Epsom, Surrey.

GARDENER (HEAD, WORKING).—Age 28; fourteen years' thorough practical experience in all branches. Well up in the Management of all kinds of Plants, Fruit, and Vegetables, and the General Routine of Gardening. Can be highly recommended from present employer. Two years' excellent character.—E. B., Leigh Road, Eastleigh, Southampton.

GARDENER (HEAD), or GARDENER and BAILIFF.—Can be highly recommended. Reason for leaving—death of employer, and disposal of estate.—G. HART, Mayfield Lodge, Shooter's Hill, Kent.

GARDENER (HEAD, or good SINGLE-HANDED).—Age 31, married, no family; thoroughly understands Gardening in all its branches. Eighteen years' experience. Staunch Teetotaler. Four years in present situation.—W. B., Gisby's Leet, Lee, S.E.

GARDENER (FIRST-CLASS); age 27.—Mr. R. GILBERT begs to intimate he is now in a position to recommend James Vert to any place of trust in Horticulture. J. V. has filled the post of principal Foreman at Burghley for three years, with infinite credit to himself and great satisfaction to me. Well up in all matters relating to the profession. A Protestant, strong and healthy, and a most respectable young man. Wages expected, £80 to £90 per year.—Apply to R. GILBERT, Burghley, Stamford.

GARDENER, where two or more are kept.—Age 30, married; thoroughly understands the duties in all branches.—J. DAWE, Ravensden House, near Bedford.

GARDENER.—Age 33, married, no family; thoroughly experienced; three years' good character. Disengaged. Left through employer giving up establishment.—J. S., 19, Edward Street, Cheltenham.

GARDENER.—Age 44, widower, two children; thoroughly understands all branches. Eighteen months' good character. Seven years previously in a nobleman's family.—E. R., Poppleton Hall, York.

GARDENER.—Aged 40, married; 25 years' practice in all branches.—M., 17, Times Terrace, Mayford Street, Hereford.

GARDENER (SECOND).—Age 22; well up in Early and Late Forcing. Good character from last situation.—W. GRANT, 5, Somerset Place, Llandaff, Cardiff.

GARDENER (UNDER), in a Gentleman's establishment.—Age 23, single; eight years' experience. Can be well recommended from last and previous employer.—J. B., 43, Richmond Place, Beacon Hill, Bath.

FOREMAN.—Has had long experience in Growing and Forcing all kinds of Fruit and Plants for Market. Good character and reference.—W. T., 4, Knowsley Cottages, Long Lane, Church End, Finchley, N.

FOREMAN.—Age 26; has had twelve years' experience in first-class establishments. Can be highly recommended from each place.—A. Z., The Gardens, Swithland Hall, Loughborough.

To Nurserymen, Florists, and Market Growers. FOREMAN and PROPAGATOR, or the MANAGEMENT in a first-class concern.—Thoroughly understands the Trade in all its branches. First-class references.—W. J. B., *Gardeners' Chronicle* Office, W.C.

To the Trade. FOREMAN (WORKING).—Steady, strictly sober, attentive, and trustworthy. Thoroughly practical in Propagating and Growing Soft-wooded and Bedding Stuff, quick and ready for Small Market Trade in Plants, Cut Flowers, &c. Wages not the object, but a kind master. A month's trial solicited.—A. B., Miss Crawford, Stationer, &c., High Street, Brentwood, Essex.

NURSERY FOREMAN, SALESMAN, &c.—Age 36, married, without family; in the trade entirely for the past twenty years. First-class references as to ability, honesty, and sobriety.—W. B., 10, Tyrrell Road, East Dulwich, S.E.

PROPAGATOR and GROWER.—Has had nine years' experience in two of the leading Nurseries of Roses, Soft-wooded and Herbaceous Plants, &c. Good references.—A. UPHILL, Norris Hill, Heaton Norris, Stockport.

JOURNEYMAN, in the houses.—Age 20; six years' experience under glass. Good character. Can be highly recommended. State wages.—W. ADAMS, Bentworth, Alton, Hants.

IMPROVER, in a Gentleman's Garden.—Age 19; sixteen months' good character. Leaving through death of employer.—P. O., The Rectory, Great Bookham, Leatherhead, Surrey.

SHOPMAN (SECOND), in the Wholesale Seed Trade, or the Management of a Retail Business in the Provinces.—Advertiser has had eight years' good experience, and possesses a fair knowledge of Book-keeping and Correspondence. State salary given.—ULMUS, *Gardeners' Chronicle* Office, W.C.

To the Seed Trade.

SHOPMAN (ASSISTANT).—Six years' experience. Good references.—H. T., Messrs. Kent & Brydon, 3, Tulwell Row, Darlington.

IMPROVER, or JUNIOR SHOPMAN.—Age 20; good reference. State terms.—H. HOLMAN, Junction Road, Burgess Hill.

KINAHAN'S LL WHISKY.

KINAHAN'S LL WHISKY. Pure, Mild and Mellow, Delicious and Most Wholesome. Universally recommended by the Profession. The Cream of Old Irish Whiskies.

KINAHAN'S LL WHISKY. Dr. Hassall says—"Soft and Mellow, Pure, well Matured, and of very excellent quality."

KINAHAN'S LL WHISKY. Gold Medal, Paris Exhibition, 1878; Dublin Exhibition, 1865, the Gold Medal.—20, Great Titchfield Street, London, W.

DINNEFORD'S MAGNESIA.

The Medical Profession for over Forty Years have approved of this pure solution as the Best Remedy for

ACIDITY OF THE STOMACH, HEARTBURN, HEADACHE, GOUT, AND INDIGESTION,

and as the safest Aperient for Delicate Constitutions, Ladies, Children, and Infants.

DINNEFORD'S MAGNESIA.

Freedom from Cough in Ten Minutes is given by

DR. LOCOCK'S PULMONIC WAFERS,

which taste pleasantly, and effect a rapid cure. Read more Cures (this week) of Pulmonary Complaints, Mr. BURGESS, M.P.S., 63, Regent Road, Salford, writes:—

"December 22, 1879.—I can bear testimony to the efficacy of Dr. Locock's Pulmonic Wafers in Pulmonary Complaints, Asthma, Consumption, Bronchitis, Coughs, Colds, Shortness of Breath, are instantly relieved and rapidly cured by the Wafers." Sold at 1s. 1/2d. and 2s. 9d. per Box.

HOLLOWAY'S OINTMENT and PILLS.

Old Sores, Wounds, and Ulcers.—The readiness with which Holloway's unguent removes all obstructions in the circulation of the vessels and lymphatics explains their irresistible influence in healing Old Sores, Bad Wounds, and Indolent Ulcers. To insure the desired effect the skin surrounding the diseased part should be fomented, dried, and immediately well rubbed with the Ointment. This will give purity to the foul blood, and strength to the weakened nerves, the only conditions necessary for the cure of all those ulcerations which render life almost intolerable. No sooner is this Ointment's protective powers exerted, than the destructive process ceases and the constructive business begins—new healthy growth appears to fill up the lately painful excavated pit.

# GLASS HOUSES

May be viewed the morning of Sale, and Catalogues had.

FOR DISPOSAL, a high-class NURSERY and SEED BUSINESS. Good Dwelling-house, Shop, and 32 Acres of Land. Market Town in Yorkshire. Established 83 years. The whole or part may be taken, or the Seed Business alone would be Disposed of. Details of PROTHEROE AND MORRIS, 93, Gracechurch Street, E.C. (432.)

English Lake District, Ambleside. OLD-ESTABLISHED NURSERY and SEED BUSINESS for SALE.

FOR DISPOSAL, The WATERHEAD NURSERIES, Ambleside, together with the SEED BUSINESS, established by the late Mr. John Grier about the year 1846. The Grounds, about 7 acres in extent, admirably laid out, and fitted with necessary appliances, are conveniently situated close to the head of Windermere Lake, in a central part of the Lake District, and are easy of access by rail or steamer. Full information will be given on application to Mr. G. C. COOKMAN, 14, Henrietta Street, Covent Garden, W.C.; or to Mr WILLIAM BARTON, Crescent Villa, Ambleside.

FOR IMMEDIATE DISPOSAL, on very moderate terms, the BATH ROAD NURSERIES and MARKET GARDEN—6 acres Garden, &c., 12 acres Grass, Barn, Piggeries, Two Greenhouses, Potting-shed and Office. Twelve years unexpired Lease: moderate rental. H. T. BATH, Seedsman, &c., 30, High Street, Lynnington.

TO BE LET, The NORTH WILTS NURSERY, Swindon. The only one in the neighbourhood: a rare opportunity. Possession at once, or Lady-day next. Stock, belonging to Owner, at a valuation, half of which can remain at 5 per cent. For a pushing man with a capital of £600 to £700 this is an opportunity seldom met. The Vines produced last season over a ton of Grapes; there is also a ready Sale for Plants of all descriptions. Apply to the Owner, JAMES HINTON, Auctioneer and Estate Agent, New Swindon.

Wandsworth, S.W. TO BE LET on LEASE, a FARM of 150 acres, within half an hour's drive from the City or West End of London. Good Dwelling-house, Cottages, and Shedding for Sixty Head of Cattle, and other outbuildings. Immediate possession. The Farm could be reduced to 120 acres or increased to 220 acres. Apply to Mr. ALFRED W. OBORNE, Resident Agent, Wimbledon Park, S.W.

Grazing Lands Suitable for Dairymen, Horse and CATTLE DEALERS, and OTHERS.

TO BE LET, about 94 Acres of MEADOW and PASTURE LANDS adjoining the Lake in Wimbledon Park, only six miles from Town; also 40 acres of Pasture with Cottages and Buildings nearer Wandsworth. Some of the fields would be let separately; the rents vary from £3 10s. to £5 per acre. Immediate possession. Apply to Mr. ALFRED W. OBORNE, Resident Agent, Wimbledon Park, S.W.

PROTHEROE AND MORRIS, HORTICULTURAL, MARKET GARDEN and ESTATE AUCTIONEERS and VALUERS, 93, Gracechurch Street, City, E.C., and at Leightonstone, E. Monthly Horticultural Register had on application.

J. T. DEANE, LANDSCAPE GARDENER.—Planting by Contract or Otherwise, Ornamental Lakes, Rockwork, &c. References kindly permitted to Noblemen and Gentlemen—places already carried out. Plans and Estimates furnished.—Wellesley House, Wellington Road, Orpington, Kent.

To the Trade. MAGNUM BONUM POTATOS. H. AND F. SHARPE can supply the Trade with a very true stock of the above-named POTATO, grown from carefully selected tubers. It is one of the best disease-resisting varieties in cultivation. Further particulars as to price, &c., may be had on application. Seed Growing Establishment, Wisbech.

Oak, English, 4 to 8 feet, 1000 to 1500 for Sale. GROWN in a PRIVATE NURSERY, and all transplanted two years ago. Price on application to W. P. LAIRD AND SINCLAIR, Nurserymen, Dundee, N.B.

CYCLAMEN PERSICUM, showing large quantities of bloom, 30s. per 100; sample dozen, 5s. WHITE VESUVIUS, 20s. per 100; 3s. per dozen, package free. GEORGE GUMMOW, 114, Loughborough Road, Brixton, S.W.

Special Offer. PEACH and NECTARINE TREES, in POTS, ripened under glass, well-shaped trees, 3s. each. VINES, leading sorts, extra strong Canes for fruiting in pots this season, 5s. and 6s. each. Very fine planting Canes, 3s. each. JAS. GARAWAY AND CO., Durdham Down, Clifton, Bristol.

TRUE ARGENTEUIL ASPARAGUS.—Strong Roots of this splendid variety are offered in three sizes, at 7s. 6d., 10s. 6d., and 15s. per 100 respectively. HOOPER AND CO., Covent Garden, London, W.C.

To the Trade. NUTTING AND SONS have now posted their Annual Wholesale Garden, Agricultural and Flower Seed CATALOGUE to all their friends; if not to hand, on application another shall be immediately forwarded. NUTTING AND SONS, Seed Merchants, 69, Barbican, London, E.C.

Gold Medal Begonias. LAING'S CHOICE HYBRIDISED SEED, superior to all others, is now harvested from their unequalled collection, which was again awarded the Royal Horticultural Society's Medal in August. Sea's 1 packets, free by post. 1s. and 2s. 6d. each. The Trade supplied. JOHN LAING AND CO., Seedsmen, Forest Hill, S.E.

Strong Pear and Crab Stocks. EDWD. HOLMES, Whittington Nursery, Lichfield, offers the above to the Trade. Price on application, and Sample if desired.

To Clear the Ground, Preparatory to a change of Residence, specially low quotations will be given for

CHOICE CONIFERS, EVERGREENS, and DECIDUOUS TREES and SHRUBS. Gentlemen about to plant are invited to apply for particulars. J. J. MARRIOTT, Highfield Nurseries, Matlock, Derbyshire.

To the Trade. FOREST TREES, extra strong and well-rooted, 4, 5, 6, and 7 feet, consisting of ALDER, BIRCH, ASH, HORNBREAM, SYCAMORE, ELM, OAK, HAZEL, BEECH, CHESTNUT. Special Prices, to clear ground, on application. JAMES DICKSON AND SONS, "Newton" Nurseries, Chester.

New Cucumber, Sir Garnet Wolseley. JOSEPH HAMILTON AND SON, Wellington Place, near Carlisle, will supply SEEDS of the above, in Packets of 6s. Post-free for 30 stamps. The points in which this Cucumber Sir Garnet Wolseley surpasses all other long-fruited varieties are the symmetry of its fruit, and the abundance with which they are produced; there being no shank or handle to Sir Garnet."—Gardener's Chronicle, September 27, 1879.

Standard Apples and Pears. EDWD. HOLMES offers the above to the Trade, cheap. Sorts and Prices on application. Whittington Nursery, Lichfield.

To the Trade. HOME-GROWN GARDEN and FIELD SEEDS. H. AND F. SHARPE are prepared to make special offers of their choice stocks of HOME-GROWN GARDEN and FIELD SEEDS to those who have not yet completed their supplies for the coming season. Seed Growing Establishment, Wisbech.

Selected varieties:—Jeanne d'Arc, finest single white; Candidissima plena, double white; Zonal Tricolor H. M. Pullett, Mr. Parker, Lord Gifford, Arnobius, Brennus, Laverna, Numitor, Syressa, Terens, 8d. each, 12 for 6s., post-free. Executors of H. WALTON, Edge End Nursery, Brierfield, near Burnley.

Potatoes—Potatos—Potatos. SPECIAL OFFER for CASH, subject to being unsold on receipt of order. MYATT'S ASHLEAF, 2s. per stone OLD DITTO, 2s. 6d. per stone RIVERS' ROYAL ditto, 2s. 6d. per stone VEITCH'S IMPROVED ditto, 2s. 6d. per stone MONA'S PRIDE, 2s. 6d. per stone ALMA KIDNEY, 2s. per stone MAGNUM BONUM, 2s. per stone RECTOR of WOODSTOCK, 3s. per stone PATERSON'S VICTORIA, 1s. 6d. per stone SCOTCH REGENT, 1s. 6d. per stone JOHN HOUSE, Eastgate Nursery, Peterborough.

To the Trade. "PRIDE OF ONTARIO" POTATO. H. AND F. SHARPE are now offering the above excellent POTATO, grown from their original stock. It gave universal satisfaction last season, having produced a fine yield, and comparatively free from disease. As the stock this season is limited early orders are requested. Seed Growing Establishment, Wisbech.

LEICESTER RED CELERY has again proved itself to be the hardiest, sweetest, most solid, and best Celery this unfavourable season; when most kinds have been soft and watery this has been good in every way. Those wishing to obtain the true article should have it in printed packets, price 1s. post-free on receipt of 13 stamps. BROCCOLI, Harrison's new Dwarf Hardy; a late valuable kind, 1s. per packet. SAVOY, Harrison's King Coffee Garden, 1s. per packet. TURNIP, Harrison's Exhibition, a perfect round white variety, from 6d. per packet. CARROT, Harrison's Early Market, 6d. per packet.

HARRISON'S "LEICESTER SEEDS," of finest quality, are supplied in collections of 21s. and upwards, sent carriage free. Trade Prices and full particulars on application to HARRISON AND SONS, Seed Growers, Leicester.

SPANISH CHESTNUT, ASH, BIRCH, HAZEL and ALDER, stout, well-rooted, transplanted. Also a large quantity of 1 and 2-yr. Seedling SPANISH CHESTNUT, at 6s. and 8s. per 1000. GEORGE CHORLEY, Costers' Nursery, Midhurst.

LARCH.—Part of our Land being required for Feuing purposes, we beg to offer 1-yr. Seedling LARCH from £4 10s. to £6 10s. per 100,000, as per samples. R. AND A. MORRISON, The Nurseries, Elgin.

THE BEST NURSERY SEED AND NURSERY COMPANY (Limited) respectfully invite attention to their Extensive Stocks of FOREST, ORNAMENTAL, and FRUIT TREES, Dwarf and Standard ROSES, Vines, &c., all in splendid condition. JAS. GARAWAY AND CO., Durdham Down Nurseries, Clifton, Bristol.

Important Notice. CHRISTMAS QUINCEY begs to inform the Trade and Potato Growers that he has imported a very large quantity of that invaluable Early Potato, THE BEAUTY OF HEBRON, which he now offers at 3d. per lb., 2s. 9d. per stone of 14 lb., 20s. per cwt. Special quotations for large quantities. Wholesale prices on receipt of Trade Card. Peck Bags 3d. each; Cwt. ditto 4d.; new Sacks, 1s. each. Remittances to accompany all orders. From the many Testimonials received, C. Q. has selected the two following as agreeing with his own experience last season, when he grew over 10 acres:—

"Leverington Road, Wisbech, November 20, 1879. "DEAR SIR,—The twelve varieties of Potatoes which I purchased from you last spring I planted with five varieties I had raised from Berries, selected during a period of five years, and which sorts I considered as disease-resisters; but this season the whole seventeen varieties were scarcely worth the digging, except "The Beauty of Hebron," which came up fifteen to twenty tubers to the root, entirely sound, handsome shaped, and were good cookers. I have been a Potato grower for twenty years, but never found such a marked superiority as in "The Beauty of Hebron" over the other sixteen varieties. A Potato which will resist the blight in a season like the last should be tried by all growers.—I remain, yours truly, "J. T. SMITH. "Mr. C. QUINCEY, Potato Grower, Peterborough."

"St. Mary's, Ramsey, December 18, 1879. "DEAR SIR,—The 10 cwt. of "Beauty of Hebron" Potatoes which I bought of you last spring, I planted on 2 roods and 30 poles of land. They produced 6 tons of very fine Potatoes, and there were but very few diseased ones, surpassing all my other crops this season, and were fit for digging about the same time as the "Myatt's Prolific."—I am, dear sir, faithfully yours, "DAVID CORNEY. "To Mr. C. QUINCEY, Potato Grower, Peterborough."

W. BALL AND CO. have many thousands of WINTER and SPRING BEDDING PLANTS; also a large quantity of HERBACEOUS and ALPINE PLANTS, at very low Prices to the Trade and large Buyers. Price LISTS forwarded on application. Bedford Road Nursery, Northampton.

For prices and particulars apply to The Nurseries, Milton, Stoke-on-Trent.

Kent, the Garden of England. COB NUTS, fine Kentish; Kentish PLUMS, CHERRIES, PEARS, DAMSONS and APPLES; specimen MULBERRIES, large AUCUBAS, large LIMES, YUCCAS, and the finest general stock of FRUIT TREES in the Kingdom, some 200,000 to choose from. General Descriptive FRUIT LIST on application. The Trade supplied. THOS. BUNYARD AND SONS, Old Nurseries, Maidstone.

Wandsworth Common and Garret Lane Nurseries. R. AND G. NEAL beg to call the attention of Gentlemen, Builders, and the Trade to their large and varied Stock of HARDY ORNAMENTAL, FOREST, FRUIT TREES, ROSES, SHRUBS, &c., grown at their Nurseries, which comprise 70 Acres of a remarkable collection of those Plants and Trees most suitable for growing in or near large towns. An early inspection is solicited. All goods delivered free on rail in London or at own residence within six miles of the Nurseries. CATALOGUES free by post on application.

Gros Guillaume Grape.—Roberts' Variety. W. TAIT AND CO. are offering strong well-grown CANES of this wonderful variety, at 5s., 7s. 6d., and 10s. 6d. each, grown from eyes taken from the parent Vine. See Gardeners' Chronicle, Dec. 20, 1879, page 794. Orders from strangers should be accompanied with remittance. The Old Established Nursery and Seed Warehouses, 119 and 120, Capel Street, Dublin.

WEBB'S IMPROVED SCHOOLMASTER POTATO. (Disease Resisting.)

This splendid new round variety has become deservedly popular, being the acme of perfection in quality and flavour. It is an immense cropper, producing tubers of large size, uniformly round and handsome, with shallow eyes; flesh, snowy white, and very mealy—undoubtedly the best Potato for table use ever introduced. STOCK LIMITED.

Price 5s. 6d. per peck of 14 lb., or 20s. per bushel of 56 lb.

WEBB'S IMPROVED MAGNUM BONUM POTATO. The Great Disease-Resister.

This remarkably late Kidney Potato is of grand quality. The tubers are of very large size, symmetrical in shape, with a few small eyes, and of exceedingly fine flavour; the flesh is firm, very white and mealy. It is an enormous cropper on all soils, and fit for use when got up, also an excellent late keeping Potato, as it resists the disease to an extraordinary degree.

Price 3s. 6d. per peck of 14 lb.; 11s. per bushel of 56 lb.; 30s. per sack of 168 lb. Much cheaper by the half ton or ton.

WEBB AND SONS being probably the largest growers of Seed Potatoes in the kingdom, can offer other excellent varieties in large quantities on very advantageous terms. Potatoes of 20s. value carriage free; 5 per cent. discount for cash.

WEBB AND SONS, THE QUEEN'S SEEDSMEN, WORDSLEY, STOURBRIDGE. NEW SEED CATALOGUE. Spring, 1880.

Now ready, price 1s., post-free, or gratis to Customers.

THE ILLUSTRATED GUIDE FOR AMATEUR GARDENERS, ENLARGED and IMPROVED EDITION, With copious and Original Articles on THE CULTIVATION of GARDEN CROPS, THE DECORATION of the FLOWER GARDEN, THE REARING of FLOWERS FROM SEED, THE CULTIVATION of LILIES, THE CULTIVATION of GLADIOLI, &c.

With One Hundred Pages of beautifully printed Letterpress, handsomely Illustrated with two magnificent Coloured Plates, and nearly 200 fine Wood Engravings. This is the most beautiful and comprehensive Seed Catalogue yet published, and should be in the hands of all interested in Horticulture.

DANIELS, BROS., THE ROYAL NORFOLK SEED ESTABLISHMENT, NORWICH.

MANGEL SEED. JOHN SHARPE can offer to the Trade well harvested SEED, and of full growth—Crop '78. Samples and Prices of ORANGE GLOBE, YELLOW GLOBE, INTERMEDIATE and LONG RED on application. Bardney Manor, Lincoln.

GEE'S superior Bedfordshire-grown FARM and GARDEN SEEDS, SEED POTATOS, CABBAGE and other PLANTS and ROOTS, &c. For truthfulness of stocks, purity of growth, and general excellence, not to be surpassed. FREDK. GEE'S selected stocks of Bedfordshire-grown Seeds and Plants have attained a world-wide celebrity. The rich soils in Mr. Gee's occupation are admirably adapted to the growth of seeds and plants, and offer facilities enjoyed at few places for bringing them away to perfection; and under his skill and perseverance they are turned to good account.—'Fide' Opinions of the Press.

Select CATALOGUE for the coming Season may be had post-free on application. Also Special Trade LIST of Bedfordshire-grown Seeds, Plants, Roots, &c., may be had on application to FREDK. GEE, Seed Grower, Seed Merchant, and Nurseryman, Biggleswade, Bedfordshire.

WILLIAM BARRON AND SON'S New CATALOGUE of FOREST TREES, ROSES, FRUIT TREES, and RHODODENDRONS, also STOVE and GREENHOUSE PLANTS, is now ready, and will be sent, post-free, on application. Elvaston Nurseries, Borrowash, near Derby.

TREES for AVENUE, PARK, or STREET PLANTING. ACER DASYCARPUM, 14 to 16 feet, girthing 5 to 7 inches. CHESTNUT, Horse, 12 to 14 feet, girthing 5 to 7 inches. " Horse, 14 to 16 feet, girthing 8 to 10 inches. " Horse, Scarlet, 10 to 14 feet, girthing 6 to 8 inches. LIMES, 14, 15, 16, 18, and 20 feet, girthing 6 to 10 inches. PLANES, Occidental, 10 to 12 feet, girthing 4 to 5 inches. " Occidental, 12 to 14 feet, girthing 5 to 6 inches. A few hundred splendid PLANES, 16 to 18 feet, girthing 8 to 10 inches. POPULUS CANADENSIS NOVA, 12 to 14 feet, girthing 6 inches. MAPLES, Norway, 12 to 16 feet. BEECH, Purple, 10 to 12 feet. OAKS, Scarlet, 10 to 12 feet. CHESTNUTS, Spanish, 10 to 12 feet. SYCAMORE, 12 to 15 feet.

They have straight stout clean stems, and handsomely furnished well balanced heads, and from frequently transplanting are splendidly rooted. They are without doubt the finest stock of Avenue Trees to be met with in any Nursery in Europe. The girth of the stems is taken at 4 feet from the ground, and not at the base, which is often deceptive. ANTHONY WATERER, Koap Hill Nursery, Woking, Surrey.

Special Trade Offer. W. BALL AND CO., Bedford Road Nursery, Northampton, have a very large stock of the undermentioned to offer to the Trade and large Buyers, in fine condition:—

Seed Growers and Merchants  
ALSO  
NURSERYMEN FOR FOREST, ORNAMENTAL, AND FRUIT TREES,  
SHRUBS, AND ALL KINDS OF HOUSE PLANTS.

**THE SCOTTISH CHAMPION POTATO.**  
**THE CHAMPION POTATO** has been most appropriately named, for, in Scotland at all events, it has thoroughly beaten every other variety in disease-resisting properties, and has lately been lifted at the rate of 10 to 12 tons an imperial acre, grown as an ordinary field crop. Having paid much attention to the Champion since it first appeared, we can fully endorse all that has been said in its praise, and certainly the past unfavourable season has proved it to be the most valuable introduction of the last few years. It originally came from Forfarshire, and, after trial, was recommended in the Lawson Seed List of 1875. In general appearance it comes between the Scotch Regent and the Irish Rock, embodying the good qualities of the former and the hardy constitution of the latter. Like other Potatoes, its eating quality varies according to circumstances as regards soil, climate, and cultivation, but it may safely be classed among good table sorts. The Champion is a strong, rank grower, and should be allowed a fourth more space at least than that which ordinary kinds require in planting. It is, perhaps, the latest field Potato to ripen, the haulm remaining fresh when that of all others is withered. It should, consequently, be planted earlier than is usual for late sorts generally in order to do it justice. It will grow remarkably well on poor soils where other kinds would not succeed, and altogether it is highly recommended for a main crop in every garden and farm. It cannot, however, be too prominently kept in view that to fortify its disease-resisting character a thorough change of seed is necessary.

We are now prepared to book Orders for fine Seed samples of the true variety, either for present or future delivery. Price per Ton on application.

## LIST OF NOVELTIES, 1879-80.

**CHARLES SHARPE & CO.,**  
SEED GROWERS AND SEED MERCHANTS,  
SLEAFORD.

### SHARPE'S INVINCIBLE NEW LONG-PODDED BLUE MARROW PEA.

The Invincible is about 3 feet in height, of a robust branching habit. The pods are produced in pairs, and occasionally three together, from near the ground to the top of the stem—the rows having the appearance of being clothed with pods from top to bottom. The pods are closely packed with from 10 to 12 large Peas, which, when cooked, are of exquisite flavour, and of a beautiful deep green colour.

As a main-crop Pea, either for the Gentleman's Garden or the Market Gardener, CHARLES SHARPE & Co. have no hesitation in saying that the Invincible Pea will be found superior to anything yet sent out.

The Editor of the *Gardeners' Chronicle*, in his review of New Vegetables in the spring of 1878, mentions Sharpe's Invincible as one of the three Peas of the season worthy of notice.

Price, per Quart, 3s. 6d.

Half-pint Packets, free by post, 1s. 6d.

### TOMATO, NISBET'S VICTORIA.

This is a seedling from Vick's "Criterion," and for cultivating under glass or in the open air there is no Tomato can approach it for fruitfulness. The plant requires no stopping, as it keeps growing and fruiting in the greatest abundance. The fruit is pyriform and grows in bunches, each bunch containing from eight to twenty fruit, which are the size and colour of a Victoria Plum; it contains but few seeds, and for flavour is unsurpassed.

"The original plant is growing under glass at Aswarby, covering a space 15 feet by 6 feet, and at the present time is carrying a crop of 600 bunches of fruit, as many more having been gathered from it during the summer.—RICHARD NISBET, Gardener, Aswarby Park, August 30, 1879."

Price 2s. 6d. per Packet.

### RAUCEBY HALL MELON.

This splendid New Green-fleshed Melon was raised by Mr. Brown, the Gardener at Rauceby Hall, and has been exhibited many times—in every case gaining a First Prize. It is hardy, a fine setter, and a very heavy cropper. The fruit is very beautifully netted, the flesh juicy, sweet, and melting, and of a very rich flavour. Altogether it is a variety of unquestionable superiority, and worthy of a place in every garden. List of Testimonials on application.

Price, 2s. 6d. per Packet.

### ASWARBY PARK SEEDLING MELON.

This fine New Melon was raised by Mr. Nisbet, at Aswarby Park, and is a cross between the Victory of Bath and Colston Bassett Seedling, and is certainly one of the Best Melons yet introduced. It is deeply ribbed, finely netted, and when ripening off it changes to a beautiful soft golden colour, thin skinned, great depth in flesh, which is of a rich transparent white; flavour exquisite. Strongly recommended.

Price, 2s. 6d. per Packet.

SHARPE'S "CONQUEROR" LONGPOD BEAN.—The longest and best of all Longpods. Price 1s. 6d. per Pint.

SHARPE'S "EMPEROR" RED BEET.—Splendid stock—dwarf, very deep in colour and glossy. Price 1s. per Packet.

SHARPE'S PRIZE WHITE SPANISH ONION.—Crop failed. It is impossible to obtain anything finer for exhibition purposes than the Seed we now offer. Price 1s. per Packet.

SHARPE'S EXQUISITE CURLED PARSLEY (The Lincoln Green).—The perfection of garnishing Parsley. Price 6d. per Packet.

### EDELWEISS.

(GNAPHALIUM LEONTOPODIUM, Jacq.)  
(LEONTOPODIUM ALPINUM, Cass.)

This lovely little alpine, with woolly silvery-white bracteal-leaves, is yet little known in our gardens, though the culture is very easy. Sown early in spring in a flat pot, filled with sandy peat mixed with some good loam and kept moist, it will grow in about a fortnight; replanted and put in a cool frame they will be fit for planting out-of-doors in about six weeks. Any good garden soil, not too stiff, will be sufficient, and a good place freely exposed to the sun will suit them. In the winter a thin cover of leaves will be of use.

Price per Packet, 2s. 6d.

SHARPE'S Extra Choice CALCEOLARIA.—Price 2s. 6d. per Packet.

SHARPE'S Extra Choice CINERARIA.—Price 2s. 6d. per Packet.

SHARPE'S Extra Choice PRIMULA SINENSIS, Red, White, and Mixed.—Price 2s. 6d. per Packet.

These three varieties of Florists' Flowers are the finest ever offered, having been carefully selected for years and grown specially for us.

CHARLES SHARPE AND CO., Seed Merchants, Sleaford, beg to intimate that their Descriptive CATALOGUE, with Cultural Instructions, for 1880, is now ready. Post-free on application. The Cultural Instructions have been revised by Mr. WILLIAM INGRAM, The Gardens, Belvoir Castle.

HOME-GROWN SEEDS CARRIAGE FREE.

TRADE PRICES ON APPLICATION.

## GARDEN SEEDS.

THE

**Gardeners' Chronicle.**

SATURDAY, JANUARY 10, 1880.

THE NEW PLANTS OF 1879.

*(Continued from p. 8.)*

GREENHOUSE PLANTS.

WE include here the half-hardy subjects which may be grown outdoors in summer, but which require to be housed during winter. The most striking plant we have to record is the Dahlia Juarezii (see *Gardeners' Chronicle*, 1879, vol. xii., p. 433, fig. 66), which, like some others, though only brought into notice during the past season, is not absolutely new. This Dahlia is a very remarkable one, its rich crimson colour, and its spreading, pointed florets giving it a striking aspect, which has suggested a comparison with the crimson Cereus, whence it has been called the Cactus Dahlia. The South-African Senecio speciosus, which was for awhile called *S. concolor*, is a plant of considerable promise; it has a good deal the aspect of a Cineraria, and, like that, may give rise to a distinct race of ornamental plants; the novelty has pinnatifidly-lobed, blunt, hairy leaves, and bears a succession of beautiful bright purple radiate flower-heads on a corymbosely-branched stem. Belonging to a very different order, but a suffruticose plant of considerable merit, is the *Lopezia grandiflora* of Mexico, which has turned up in the French gardens; the almond-like foliage is elegant, and towards the ends of the vigorous stems the many subumbellate heads of flowers are collected into an irregular panicle, which is exceedingly showy, both calyx and corolla being of a lively cherry-red colour. The *Blandfordia flava*, with its golden-yellow flowers, will form a very nice contrast with the more familiar orange-coloured species and varieties, and will therefore prove a welcome addition to a family of great beauty and interest. In the *Imantophyllum miniatum* Lindeni (*Clivia*, III. *Hort.*) we have a grand variety of this beautiful plant, remarkable for the large size of its flowers and flower umbels. Here may be included, with the reservation that it requires an intermediate-house, the *Coutarea Scherffiana*, of New Granada, a fine shrubby evergreen Rubiaceae plant, with opposite ovate acuminate shining leaves (alternate in the figure in the *Illustration Horticole*) and largish funnel-bell-shaped white flowers in cymes at the end of the branches. Here, too, should be mentioned the Rockwood Lily of New Zealand, *Ranunculus Lyallii*, which requires special treatment for its successful cultivation.

In the group of greenhouse foliage plants the principal subject to refer to is the *Meryta sonchifolia*, a rather nice-looking evergreen shrub from New Caledonia, thriving in a cold house, and remarkable for its brown-spotted leaf-stalks, and its lyrate-pinnatisect leaves, resembling those of the Sow-thistle in form, but variegated with numerous yellow spots. *Asparagus flexuosus* and *A. virgatus*, both pretty feathery subjects, claim a notice here, as also do various novel Sarracenias, as *S. formosa*,

an interesting hybrid between *S. psittacina* and *S. variolaris*; *S. atrosanguinea*, a remarkably fine variety in the way of *S. flava*, but with a rich blood-crimson orifice to the pitchers; and *S. flava ornata*, a form in which the deep red venation of the lip of the pitchers is singularly prominent and conspicuous.

#### PALMS AND CYCADS.

Of Palms which have appeared prominently during the past year, we have to mention the bolder-habited pinnate species, *Kentia McArthurii* and *Cyphokentia robusta*, and the more elegant and finely divided *Cocos elegantissimus*, *Astrocaryum decorum*, and *Calamus densus*. The thick trunked *Phoenix cycadifolia* of the Athens garden, if not an altogether abnormal growth, is peculiar for its striking resemblance to a Cycad. *Pritchardia macrocarpa* and *Trithrinax acanthocoma*, are interesting Fan Palms, the latter especially remarkable for the spinescent sheaths which clothe the dwarfish trunk (see *Gardeners' Chronicle*, 1878, vol. ix., p. 661).

Of Cycads we may name the beautiful erect-growing *Cycas pluma*, the provisional name of which may need critical rectification; and the fine Mexican *Ceratozamia fusco-iridis*, a species of distinct and striking character, producing pinnate leaves with lanceolate acuminate leaflets, 6 or 7 inches long.

#### FERNS.

One of the most interesting which have lately appeared is the *Adiantum Bausei* (*Gardeners' Chronicle*, xii., p. 465), a Fern remarkable both for its distinct aspect and supposed hybrid origin. Its peculiarity is the pendent character of its pinnules, a feature which, in combination with its free and healthy growth, will give it much value for decorative purposes. The charming little *Adiantum mundulum*, which has sprung from *A. cuneatum* in Continental gardens, is another gem in its way, quite dissimilar to its parent. The South Sea *Asplenium horridum* and *neocaledonicum*, though very dissimilar, are both desirable kinds for ornamental purposes—the latter for the narrow elongated segments of its firm leathery fronds, the former for its bold habit and great arching pinnate shaggy-stiped fronds, requiring stove heat and a plentiful water supply for their full development. *Polystichum viviparum* and *P. lentum*, the first from Western the second from Eastern India, are Ferns of decorative merit and evergreen, viviparum having arching fronds, proliferous towards the tip, and *lentum* growing more erect and shuttlecock fashion. As a greenhouse evergreen Fern *Lomaria fluviatilis multifida* is likely to prove of some decorative value, as are most of the varietal forms which have the multifid or tasselled character. Finally, the Japanese *Polypodium Kramerii* is a very pretty dwarf creeping hardy species, ranking beside *P. Dryopteris*, but perfectly distinct; and *Davallia Mariesii* (shown under this provisional name) seems to differ from the smaller species to which it is allied in being evergreen: its affinity is with *D. bullata*, which is deciduous, and with *D. decora*, which, so far as we know, is not hardy, while the present plant is evergreen, continuing to grow throughout the winter in a cold frame, and therefore nearly if not absolutely frost-proof.

The golden variety of the common garden *Selaginella*, *S. Kraussiana aurea*, which originated in the North of Scotland, and has been once or twice seen in public at the London shows, is a remarkably brilliant decorative plant, where the golden hue can be advantageously introduced.

#### STOVE PLANTS.

The first place here must be claimed for the Bornean *Burbridgea nitida* (*Gardeners' Chronicle*, xii., 400, fig. 63), on account of its

combined botanical interest and floral beauty. Its tall clustered stems bear elliptic-lanceolate leaves, and are surmounted by panicles of from twelve to twenty rich orange-scarlet flowers, of which the three outer segments are broad and spreading, and the inner reduced to a small bifid yellow lip placed opposite to and folded round the anther, in which resides its botanical singularity. In its native country, Mr. Burbridge tells us, it grows and flowers for nine months out of the twelve. *Dipladenia carissima*, of garden origin, is a charming addition to this genus of Dogbanes, and on account of its very delicate blush colour will produce a fine contrast with the deeper-coloured species and varieties, which are now becoming plentiful. Another most striking plant is the *Hibiscus rosa sinensis schizopetalus* (*Gardeners' Chronicle*, xii., 273, fig. 45), whose flowers grow on long pendent stalks from the leaf-axils, and whose orange-red petals are reflexed and cut deeply into a multitude of fringed segments. Amongst flowering stove plants the Bromeliaceæ have come rather prominently to the front—not all new, but some of the species reintroduced. There is *Tillandsia Balbisiana*, with its sparkling bouquets of purple and orange; *Tillandsia tricolor*, with its red stem-bracts, and green distichous floral bracts, and narrow purple petals tipped with white; *Tillandsia Gardneri*—known also as *T. argentea*—with its sparkling foliage, as if made of frosted silver; *Caraguata Van Volxemi*, with its short spikelets of yellow flowers, compacted together on the axils of orange-red bracts to form a narrow compound spike; *Bilbergia nutans*, with its slender scape nodding at the top, its rosy-pink conspicuous bracts, and its pink-calyxed flowers having green recurved blue-edged petals; *Echmea Furstenbergii*, with its dense cone-shaped rosy inflorescence seated in the heart of the leaf-tuft; *Hohenbergia exudans*, with its crimson stem-bracts, and compact roundish paniculate band of yellow flowers tipped with orange, and with a copious white ceraceous exudation in the interspaces; and finally *Canistrum eburneum* with its rosette of maculate green leaves, in the midst of which is set a tuft of short, broad, ivory-white floral leaves surrounding numerous small white clavate flowers which just fill out the opening—all interesting objects, and strikingly dissimilar for closely-allied family friends.

Of the foliage plants the Crotons or Codicæums are still unexhausted, newly introduced and hybrid forms continually cropping up. *C. Evansianus*, with dense subtrilobate leaves, the veins at first yellow then orange, is a distinct and pleasing form. *C. Hawkeri* with the middle of the plant and of the leaves yellow, the outsides and the border green, is also distinct and striking. *C. Massangeanus*, a long lance-leaved spreading foreign hybrid, is very showy in its yellow, green, and carmine-rosy colouring. *C. roseo-pictus* has the pretty rosy tint of *Williamsii* present in its older leaves, which are obovate and well displayed. *C. Burtoni* is another fine kind in the way of *Veitchii* as to coloration, but with the leaf margins wavy; while in *C. Brageanus*, the long inch-wide leaves are marked with a creamy variegation which turns to rose. Of another type of elegance is *Aralia reginæ*, a New Caledonian plant, of erect habit, with palmatifid leaves, divided down to the top of the mottled petiole into about six flat narrow pointed bright green leaflets. Some handsome *Bertolonias*, as *B. Killickii*, and *B. Rodeckii*, bronzy with silvery ribs and spots, and some charming *Marantas*, as *M. Kerchoviana*, which is of the *Massangeana* type, have also been added to our lists.

#### ORCHIDS.

Many interesting and ornamental additions have been made to this ever popular family—

now more popular than ever—and some of these when they become established, so as to be seen in their true character, will probably take a very high rank in public estimation. Of those alluded to *Cymbidium Lowianum* may certainly be noted as an acquisition (see *Gardeners' Chronicle*, 1879, vol. xi., p. 405). Its handsomely spreading foliage, and its long drooping spikes of strikingly if not gorgeously coloured flowers—pale olivaceous green, with a yellowish lip, the terminal segment of which is a rich maroon—together with their large size and handsome insect-like form, all mark it out as a popular subject. *Dendrobium cerinum*, in the way of the old *sanguinolentum*, is a showy species from the Malayan Archipelago, with large ochraceous flowers, firm and strong, like wax, the lip marked with rich brown lines radiating from the base. We have also to note two fine hybrid Dendrobes: the one, *Dendrobium micans*, a cross between *Wardianum* and *lituiflorum*, with knotted stems and large pallid flowers with deep purple tips, the lip having also two dark Indian-purple spots, one on each side, near the base; the other, *D. splendidissimum*, which our orchidic friend, Reichenbach, describes as “a great beauty,” and which has large flowers shining as if varnished, cream-coloured, with purple at the tip, while the disk of the lip is of a dark Indian-purple, with many radiating lines running out from its base, being moreover covered with velvety hairs, and having a broad hairy line running backwards to the base. We have to note sundry choice additions to the fine group of *Pescatoreas*, e.g., *P. Gairiana*, with deep violet sepals and petals, and a broad rose-coloured lip having a radiating callus of some fifteen to seventeen lamellæ covering half its surface; *P. Klabochorum*, with white flowers tipped with chocolate, and an ochre-coloured lip with many small purple spots and a sulphur-yellow callus of nineteen lamellæ: and *P. Lehmanni*, in which the sepals and petals are white densely striped with purple, and the lip a deep violet-purple, covered with long bristle-like papillæ on the anterior part, and with a callus of eleven lamellæ at the base. *Disa grandiflora psittacina* is a new form of that wonderful plant, in which the lateral sepals appear to be of a crimson colour, from the number of crimson spots, and the upper sepal is striped with purple. In *Pachystoma Thomsonianum* (*Gardeners' Chronicle*, xii., 582, 624, figs. 102, 103) we have an interesting plant from tropical Africa, of a distinct type, with clustered roundish pseudobulbs, and two or more flowered scapes of shining white flowers, with a recurved lip of the brightest purple.

And what more shall we say, for time and space would fail us to tell of the lovely little *Cologyne Hookeriana*, of the broad-sepal *Cypripedium Lawrenceanum*, of the wonderful *Masdevallias Backhousiana* and *Parlatoreana*, of *Compartmentia speciosa*, of the mammoth *Bolbophyllum Beccarii*, of *Odontoglossum elegans*, of the violet-scented *Oncidium Edwardi*, of *Miltonia Bluntii*—all worthy of more extended record; to say nothing of the wondrous Orchid hybrids now so frequently startling us by their unexpected apparition, and of which *Cattleya Mardellii* X, *Cattleya Marstersoniæ* X, *Lælia Dominiana* X, *Lælia Philbrickiana* X, *Cypripedium Ainsworthii* X, and *Cypripedium venixum* X are comparatively recent and meritorious illustrations. *T. Moore*.

#### CYPRIPEDIUM SPICERIANUM.

THIS species, which was exhibited before the Floral Committee on October 18, is one of the smaller flowered species, noted at the time of exhibition as having the upper sepal white with a central purple line, lateral sepals greenish, also with a central line, the lip greenish shining, and the top of the column white spotted with violet,

New Garden Plants.

ODONTOGLOSSUM HORSMANI, n. sp. (*potius hybrid.*)\*

This has been collected near Ocaña, in New Granada, by Mr. Fried. Horsman, for the New Plant and Bull Company, Lion Walk, Colchester. About Ocaña grows, it is well known, *Odontoglossum Pescatorei*, and there can be scarcely a doubt that the present plant is a mule between *O. Pescatorei* and *luteopurpureum*, represented in that neighbourhood by rather indifferent varieties. Thus our new *Odontoglossum* would appear to be the "pendent" of *Odontoglossum Coradinei* (obtained from Messrs. Veitch, Boeckett, Day, Borwick), as that is no doubt the offspring of the cross-fertilisation of *Odontoglossum crispum* and *luteopurpureum*, or a similar species. This one has much longer flowers. The pseudobulb of our novelty is compressed, pear-shaped, with furrows and folds, 1 inch long by two-thirds over the base. The linear-lanceolate leaf is 5 inches long and 3/4 inch wide. The peduncle bears a flower as large as that of a middle-sized *Odontoglossum Pescatorei*, and nearly same shape. The ground colour is

as the bogs of Ireland are noted as the grave of the giant deer, extinct in historical times.

Mr. Horsman has seen few flowered inflorescences at the place. Unfortunately he did not dry any. The petals are said to have been white when flowering at Colchester. When they arrived at Hambrogh they had just the same white-sulphur tinge as the sepals and lip. *H. G. Rehb. f.*

ODONTOGLOSSUM CRISPUM (Lindl.) BLUNTII FLAVOLBUM.

It is well known that we were not aware of the immense richness of variation this splendid Orchid offers. The one set of varieties has usually smaller flowers, very often, nearly always, of a much stronger substance, always with a blunt lip. Those are the *Bluntii*, dedicated to Mr. Blunt, who is so famous for having sent that glorious stock of *Laelia elegans* which is one of the quite unique marvels of the Dayan collection, all those *Cymbela Milleriana*, that fresh collection of glorious *Oncidium Gardneri* that came under the hammer as much inferior *O. curtum*, so that there was a deception in favour of the purchaser—not a very common case. I have just now at hand two

sure now about it; the other was this great curiosity. Pallid honey colour flowers in a rich raceme: perhaps they are a little shorter—at least I had such an impression. The anterior lacinia of the lip, in lieu of being oblong and acute, is obovate and emarginate at the top. Those small appendices, so highly characteristic of *Cymbidium elegans*, were also perfect, yet in lieu of being rose, pink, or mauve, they were white. As long as there are no richer materials at hand it appears safer to establish a variety only. The plant is in the collection of Arthur Pott, Esq., Hoole Hall, Chester. *H. G. Rehb. f.*

EDWARD W. COOKE, R.A.

It is with a sense of ir retrievable loss and deep grief that we announce the death of this accomplished gentleman, at his residence, Glen Andrew, Tunbridge Wells, on the 4th inst. Best known to the general public as an artist, he was still more widely known in scientific and literary circles by the catholicity of his sympathies. As a painter he is familiar to most of us by his numerous Venetian scenes, which bring before the spectator the light and air and colour of modern Venice with all its wealth of architectural detail. Equally faithful and sympathetic were his sea pieces. The long low sandy shores of Holland with their fringe of angry surf—the clouded skies—the quaint craft with their effective patches of colour, have never had a better illustrator. The artistic talent with him was hereditary. He was the son of a famous engraver, and himself practised the art in early life. But, as we have said, Cooke was many-sided. His genial earnest temperament was ever in full sympathy with what was beautiful, good, and true in all departments of knowledge. He seemed to be interested in everything, and, more, he made those who were with him share his interest. It was impossible to be in his company for any length of time without catching something of his zeal and enthusiasm: art, virtu, Venetian glass, fossils, mechanism, botany, geology, and we know not what beside, found in him an active lover. His zeal and enthusiasm often seemed too great for his feeble frame, but it may be that they supported him in trials which would have injured a stronger man not so endowed.

No wonder that such a man was a gardener. More than thirty years ago we knew him as one of those landscape gardeners who had, what few landscape gardeners have, such a knowledge of plants as to give him the choice of the wealth of material in the nurseries and to enable him to dispose them to the best advantage. The small gardens attached to his residences in Kensington were models of what small town gardens might be made by one who combined artistic power of grouping and genuine love of plants. Mr. Cooke's counsel was eagerly sought after by his acquaintances in the arrangement and planting of their grounds. But the boldest and most original of his work in this way may be seen at Glen Andrew. Rocks and rock scenery were a *sine qua non* with Mr. Cooke. Rocks were not to be had anywhere else so near London, hence the choice of a site for his house and garden. But even then the rocks were not always just where they were wanted. But they came at his command. If they would not show themselves above the surface he made them do so. With a long wire probe he probed the soil around and between the buried rocks, and then scooped away the sand with a diligence *proprio manu*, till bold bluffs, mountain gorges, wooded ravines, with limpid rivulets trickling between, rewarded his exertions. Here was fit resting place for Ferns, for alpine, for aquatics, for anything that would grow. What some would reject as weedy rubbish, Cooke, by putting into a suitable place, made attractive to those who had eyes to see.

Mr. Cooke married into the Loddige family, which may partially account for his knowledge of and good taste in plants. Many of the illustrations in Loddige's *Cabinet* were from the brush of his father—some were executed by himself, as also were some of the drawings for *Loudon's Encyclopaedia of Plants*. Later on, by the marriage of his sister to one of the sons of the late N. B. Ward, he became intimately connected with that most amiable man. There was much in common in the two men, the same lovable character, the same appreciation of what was pure and good and beautiful—the same keen love of Nature in all her manifestations, the same sympathy with knowledge and progress, the same freedom from petty affectations and shams, the same generosity towards others.

In his pictures—to revert once more to the work

FIG. 7.—CYMBIDIUM SPICERIANUM. (SEE P. 40.)

a very light whitish sulphur. The sepals bear a few cinnamon blotches. Lip broad, cuneate at base, obscurely pandurate, toothletted, with two bidentate ancipitous linear diverging keels before the disc, having enclosed a thick tumour and each outside, arching towards the base, thickened furrowed plates, showing small obscure teeth at the rounded outer border. The whole of this callus is orange-coloured, and there is a dark cinnamon blotch on the disk in front. Column wings nearly square, with very small crenulations and a row of brown spots. The plant is, of course, inscribed to its lucky discoverer. It is a grand thing to find now-a-days a new *Odontoglossum* in the hilly, much trodden environs of Ocaña, which in some time may be as famous for its destroyed Orchid flora

inflorescences of a very curious form of *Bluntii*, sent from Mr. Bull. They both deserve the name of *flavolum*, though not in same degree. The one variety has pure white flowers, with only some red on wings, and those few red well known stripes on base of lip. The whole disk of the lip, as well as the crests, are good yellow. The other variety is rather distinct, having lip and petals very crisp, which is not so often the case in the herd of *Bluntii*, and sulphur in disk, odd sepal equally coloured, equal sepals totally sulphur-coloured. Sepals with few brown spots, which are chiefly marked inside, though they are translucent outside. Inflorescence very dense and rich. *H. G. Rehb. f.* [This plant has also flowered with the New Plant and Bull Company, Colchester, whose stock of it was collected by Mr. William Wallace, near Bogota, in 1878. The New Plant Company therefore share with Mr. Bull the honour of its introduction. EDS.]

CYMBIDIUM ELEGANS (Lindl.) OBCORDATUM, nov. var.

Mr. Stuart Low sent me the other day flowers of two *Cymbidia*, obtained from one of his acquaintances. The one belonged to *Cymbidium affine*, Griff., a plant the limits between which and *Cymbidium Mastersii*, Lindl., do not appear very decided, and which may be a local variety, though I am not

\* *Odontoglossum Horsmani*, n. sp. (n. hybrid. potius).—Pseudobulbo compresso pyriformi sulcato ac plicato; foliis lineariligulatis acuminate; pedunculo unifloro ("nunc plurifloro"); sepalis trianguloligulatis; tepalibus oblongis acutis, labello pandurato minute denticulato, callis ancipitibus ligulatis bidentatis geminis in medio, interposito callo rotundo multo brevioris, callo utrinque humillimo depresso multisulcato extus minute denticulato; columnæ alis subquadratis, angulo utrinque extus in columnæ angulo antico subfovea. Flores albo-sulphurei. Sepala cinnamomea maculata. Calli labelli aurantiaci. Macula cinnamomea in disco antico labelli. Alæ columnæ albo-sulphureæ cinnamomeæ maculatæ. Macula furca antice subfovea.—Ocañæ detexit dom. Horsman. *H. G. Rehb. f.*

by which he achieved fame and fortune—his mental characteristics may be traced—his love of truth, his accurate observation and fidelity in reproducing them. Many of his pictures are scientific lesson-books: the dip of the strata, the grains of the sand, the shapes of the leaves, the curvatures of the trunks of the Palm trees, the form of the rain-clouds, the line of the waves, and hundreds of such instances betoken, not only the artist, but the man of science. There is an amount of absolute truth about them, apart from imagination, which will give his pictures a permanent value beyond that of many of his contemporaries.

If, humanly speaking, anything can lighten the sense of such a loss to the survivors it must be the remembrance of such a career and the manifold assurances of widely-spread deeply-felt sympathy.

## GROSVENOR GALLERY.

BEFORE these notes are published the Winter Exhibition at the Grosvenor Gallery will be open to the public. There are no large and important pictures in oils in the gallery, the collection consists principally of water-colour drawings of moderate or small size, and a large number of artists' studies in ink, chalk, and pencil. The first fifty-five water-colour drawings are contributed by the Society of Painters in Water-colours of the Hague; many of these pictures are bold and sketchy productions, representing flat landscapes, such as one is familiar with in some parts of Norfolk, Suffolk, and Cambridgeshire. The first picture of horticultural interest is 9, and this is termed "Flowers," Madame Mesdag Van Houten; it is Whistlerian in its treatment, and the Roses are of the tea-tray variety: what the other "flowers" in the composition may be meant for we know not. 15, "Pears," by the same artist, shows the same want of knowledge as 9. In passing a pause may be made at 13, to admire the curious study termed "Amateurs," by L. Alma Tadema. 50, "Roses," Mdlle. G. J. Van de Sande Bakhuysen. This picture is of a very different class from 9 and 15: it represents a group of white Roses with grass in flower, and the drawing of the blooms and foreshortening of the foliage is everywhere carefully studied and well painted. 55, "Horse Chestnuts," by the same lady, is equally good, the spray of Oak and Bramble, and the ripe Horse Chestnuts, are excellently represented. No. 58, "Holywell, Conemaara," W. Small, will repay study; and 73, "Llangharne Castle, South Wales," J. W. Whymper, one of this admirable artist's best productions. The building represented is probably the somewhat modern Llangharne Castle, near Carmarthen. 92, "Roses," Miss Maud Naftel, is both well drawn and well painted, but the whole picture is in body colour. 100, "Chrysanthemums," J. J. Harlwieke, is at best a poor thing. 103, "A Morning for Mushrooms;" Mr. F. Smallfield—the artist—is probably right in his representation of the *morning*; in this capital picture, but the painting certainly does not show the *place* for Mushrooms, viz., a wet grassy stream-traversed meadow. Although Mushrooms are generally termed "meadow Mushrooms," yet these esculents do not generally grow in meadows, but rather in pastures where the "ewes bite." 113, "Wild Cherry Blossom," J. M. Jopling. This is a carefully painted picture of a very realistic large glass jar with a few sprays of the wild Cherry inserted—the latter not remarkable for correct drawing. 125, "Daniel," Briton Riviere, A.R.A., is the fine study of hungry lions and lionesses, the extraordinary figure of Daniel, seen from behind, being quite subservient. 130, "Circe," by the same artist, is the still better study of swine in all imaginable attitudes, and with all imaginable expressions. "Circe" commends herself to one's pre-conceived notions better than does the back elevation of Daniel in 126. 162, "The Wars of the Roses," Lady Lindsay, is a pretty and carefully drawn and painted picture of red and white Roses, in which body colour is to a great extent used. To reach our next number we have to pass into the Sculpture and Water-colour Galleries. 222, "Iris and Rhododendron," Mrs. W. Duffield, is one of the best flower subjects in the exhibition, but it has a too marked inclination towards botanical stiffness; there is a spray of scarlet Begonia in the foreground, a plant seldom attempted by cautious flower-painters. 228, "Flowers," by the same artist, is better than the last, the unobtrusive pot, of simple form and

low colour, greatly aids the varied outlines and brilliant colours of the flowers. Close by is 230, "Rhododendrons," Mrs. E. Taylor. This is a wretched representation of the blooms and foliage of the Rhododendron. We here pass many good landscapes and figure subjects, together with many pictures calling for no special comment from us, till we get to the East Gallery, where there is a large collection of artists' studies in chalk and pencil. Mr. E. Burne-Jones sends a considerable number of elaborate studies and sketches on paper, mostly of figures in this artist's well-known style. 379, "Study of Lilies," E. Burne-Jones, is one of the best pencil studies of the White Lily (*Lilium candidum*) that we have seen: it is small in size, and dated 1855, but the flowers, buds, and leaves, seen in all stages of growth and perspective, are worthy of careful attention. 384, "Studies of Flowers," Sir F. Leighton, P.R.A., are carefully drawn blossoms of the Pumpkin; there is nothing extraordinary in two small Pumpkin flowers, but the extreme accuracy and beauty of the drawing is worthy of attention. 395, "Studies of Thistles and Teazels," by the same artist, aims more at the general exact effect of form and colour in these plants than minute detail; the Knap-weed is included in the group. 418, "A Lemon Tree," by the same artist, is the most remarkable piece of botanical drawing in the exhibition: the exactitude and elaboration of detail in every leaf and twig through the complete tree, and the general beauty and excellence of the entire drawing, call for special remark. 417, "Poppy in Seed," also by Sir F. Leighton, is another good drawing, but, strange to say, the plant represented is not a Poppy at all. It is a Knap-weed (*Centaurea Scabiosa*), with the well-known globular involucre and the numerous bracts. 442, "Study of a Poppy in Seed," A. Moore, is a life-like drawing of the White Opium Poppy. In 452 we have one of a group of four drawings by L. Alma Tadema, R.A. This special drawing, termed "Studies of Architecture," is interesting as showing with what care this artist studies and sketches architectural details with a possibility of their introduction in some future picture. 454, "Studies of Flowers," A. Moore: these are remarkably well drawn and truthful scraps representing Marigolds in a tumbler of water, the wild Hearts-ease, and the red Poppy of our cornfields. 497, "Study of Thistle-heads and Leaves," Sir F. Leighton, is a faint but careful pencil study of these parts of Thistles. Sir Coutts Lindsay, Bart., contributes several drawings of merit, the decorative pictures being perhaps the best. In 535, "A Study," the perspective of the piano is uncommonly bad, and could hardly have been studied from the real object. If Sir Coutts will walk round his drawing-room and keep his piano in view he will find that wherever he places himself he will still be able to see the top of the piano: if Sir Coutts will now sit in a chair, first in one part of his drawing-room, then in another, he will find that the top-surface of the piano invariably appears as a horizontal line. In the drawing here referred to the back of the piano is shown to suddenly drop at an angle of 45°. No spectator could possibly see such an angle on a piano-top unless he first laid himself flat on the floor near the bottom of the piano, and there made his observation.

## EXHIBITION OF WORKS OF OLD MASTERS.

THIS exhibition of pictures, which includes works by deceased masters of the British school and a special collection of works by Holbein and his school, is now open at the rooms of the Royal Academy at Burlington House. It does not contain a single work of horticultural or botanical interest, though there are many landscapes of great beauty, notably (11) "Somerset Hill," near Tunbridge, Kent, by Turner, showing the house on a wooded slope with a lake in the foreground. It seems hardly credible that the painter of this picture could ever have painted 35, "The Grand Canal, Venice—Blessing the Adriatic;" the first is quiet and low in tone, whilst the latter is a harsh blaze of staring colour. Gallery No. I. contains four old paintings by George Morland, one by John Crome, and two by Hogarth. Gallery No. II. has four works by Albert Cuypp, and in the three first rooms there are nine works by Thomas Gainsborough, Reynolds, Vandyck, Nicholas Poussin, Salvator Rosa, Tintoretto, Guido, Sebastian del

Piombo, Canaletto, Titian, Paulo Veronese, Ruysdael, Rubens, Teniers, Paul Potter, Etty, Romney and Sir Edwin Landseer, are represented in the first three galleries by one or more pictures (some of these being well known by steel engravings). Gallery No. IV. is set apart for examples of Holbein and his school, the room being full of prim but highly finished and life-like portraits. Many are of great historical interest, others are indefinite as to persons. "Portrait of a Man" frequently occurs—an old man being in one instance termed "a young man," the compiler of the catalogue possibly having his own views of "old" and "young" as applied to men. In Gallery No. V. and last is a curious collection of old paintings belonging to the Siennese, Italian, Umbrian, Venetian, Early Tuscan, Arragonese, Castilian, and Florentine schools. Some of the painters here (like the subjects) are unknown. The four illustrations of the story of Nastagio degli Onesti, 212, 213, 253, and 254, from the *Decameron*, are very amusing, as is 218, "The Marriage Feast of Peirithous," where the servants who bring in the viands are Centaurs. "Centaur Helps" might have answered in the times of Peirithous, but Mrs. Crawshaw herself would hardly recommend such adjuncts for modern households. 219 is a "Battle Scene," a somewhat indefinite title, but the compiler of the catalogue makes up for any obscurity in the subject by kindly giving a full explanation of the letters S. P. Q. R. as seen on one of the banners—no one ought to be ignorant in these days. There are many illustrations of Christian and heathen subjects in this room, and no picture is more amusing than 245, "The Last Judgment," by an unknown artist of the Castilian school.

## THE DRAGON TREE OF AJUDA.

THE *Dracena Draco*, growing in the Royal Gardens of Ajuda, Portugal, is illustrated in a recent number of the *Revue Horticole*. It is a noble tree, coeval with the foundation of the garden by the Queen Dona Maria I., and at least is not younger than 120—150 years. The dimensions given are, 6 metres in height, 35 m. in circumference, the girth of the principal trunk being 4 m. 65 cm. This divides into eleven principal branches, and an infinitude of minor subdivisions, the ultimate extremities bearing tufts of sword-shaped leaves, which form an impenetrable shelter from the sun. The tree produces seeds annually to the extent of 3 alqueires (1 alqueire = 13 litres 80 centilitres). In France, a packet containing fifteen seeds costs about 1 f. 25 c. When the French Sisters of Charity took up their residence at the asylum of Ajuda they obtained 30 alqueires of the seeds, which they constructed into necklaces and rosaries, which were sent to France and sold for a good price. The tree, moreover, yields an abundance of resin, used for varnish making. It is a noble looking object, and strongly excites the attention of visitors. Our contemporary tells as a fact, for the authenticity of which he vouches, a story of a British Admiral commanding a fleet in the Tagus, who was so impressed with the grandeur of the tree that he wished to purchase it. "Unable to restrain his enthusiasm he walked up *tout ému* like the good Englishman that he was (*sic*) to one of the gardeners, and asked him, in the best Portuguese that he could command, if this magnificent tree were for sale. The gardener, smiling, replied in the negative, but this did not satisfy the Admiral, who gave the gardener no peace until he had communicated his wishes to his (the gardener's) superiors. The enthusiastic Englishman said that he would give £1000 sterling, and would come with his sailors and dig up the tree with the greatest care and transport it to England. But in truth the enterprise was impossible, even for an Englishman. . . . The episode is on the faith of eyewitnesses worthy of credence, absolutely authentic." We suspect our Portuguese friend did not understand the Admiral's little joke, especially as his Portuguese was somewhat defective.

✻ BURIED OAK TIMBER.—In deepening a river in the neighbourhood of Norrköping, in order to make it accessible for ships of heavier draught, amongst several objects of interest brought up from the bottom, eight oak trees were found at a depth of about 7 feet under the old bottom. The bark is almost decayed, and when it was taken off the wood was found to be hard and black, resembling ebony. The trees are supposed to have been lying 900 years in the earth. The trees have been sold to a firm of joiners, who intend using them for cabinet work. *Timber Trades Journal*.

## Forestry.

**THINNING SCOTCH FIR PLANTATIONS.**—A letter appeared in your last number for 1879 from Mr. C. V. Michie, forester on the Cullen estates of the Earl of Seafield, in which he disputes the authenticity of some figures in a circular written by me for Messrs. Little & Ballantyne, to show the possible returns realised from the sale of young Scotch Fir trees during fifty years' growth. Will you kindly allow me part of your valuable space to reply to Mr. Michie's strictures, which are, I think, likely to mislead landed proprietors who are at present preparing to plant their poor lands with trees?

In regard to the figures referred to by Mr. Michie in my paper "On Our Timber Supplies," they were certainly authentic, and not "purely imaginary and speculative," as Mr. Michie somewhat hastily calls them. They are extracted from a very interesting report on the "Woods and Plantations of Highclere," by Mr. Andrew Peebles, a practical forester of great experience, and which was printed by the Scottish Arboricultural Society in their *Transactions*. In this report Mr. Peebles gives his opinion very distinctly as follows:—"From this it appears that land not adapted for agricultural purposes, if planted with Scotch Fir, judiciously managed, will pay something like £2 per acre at the end of fifty years, and that, too, in a locality where there is little demand for such produce."

In case, however, Mr. Michie should still adhere to his rather strong assertion that the value of thinnings is in all cases simply "a self-imposed deception," let me remind him that his opinion is not sufficient by itself to settle such an important question; and that as his experience has been probably confined to the northern locality in which he has so long worked, we must claim the right to summon witnesses from other districts, whose evidence will be entitled to equal weight with Mr. Michie's. For this purpose I have made the following extracts from authentic reports published by a few well-known foresters, and who it will be seen confirm the estimate made by Mr. Peebles of the results of well-managed plantations of Scotch Firs.

The late Mr. William Thomson, Deputy Surveyor of H.M. Chopwell Woods, Durham, in a paper published in the Scottish Arboricultural Society's *Transactions*, states:—

"Let us, however, leave a margin for contingencies, and assume that in a space of fifty years the value of plantations will be—not £300, not £150 (according to some estimates)—but say £100 per acre, just one-third. Woodlands of ordinary capabilities ought to yield this sum, and unless they do so we submit that their management must be, not only indifferent, but unskilful in the highest degree. This, it will be observed, is a return of £2 per acre per annum, exclusive of thinnings which have been taken out during the whole period of the plantation's growth. But as we are now computing in round numbers, we may allocate these to the liquidation of the rent of the land," &c. "We wish no one may be able to say that our statements are of a merely theoretical character, which cannot be carried out practically."

Mr. D. F. Mackenzie, forester, Meldrum House, Aberdeenshire, in a report on "Felling Timber Trees," published in the Scottish Arboricultural Society's *Transactions*, says:—

"None of our timber trees are more extensively cultivated than the Scotch Fir, its timber being applied to almost all purposes to which common wood is applicable. This tree is not particular as regards soil or situation, and can be cut down with profit at the age of thirty-five years and upwards. I felled a large wood of Scotch Fir on an estate in the North on land worth less than 2s. 6d. per acre. The age of this plantation was thirty-five years, and the net return, after maturity, was £33 per acre."

This wood was cut down too young.

Mr. James Wood, wood-manager, Bayham Abbey, Tunbridge Wells, in a paper on "The Arboriculture of the County of Kent," in the Scottish Arboricultural Society's *Transactions* (1877), writes:—

"There are several hundred acres of moorish soil, part of which is covered with a healthy thriving crop of Scotch Fir; but much is still lying waste, which if it were planted would realise 20s. per acre for the time it occupied the ground, although small Scotch Fir only sells at present at 6d. per foot, and trees 8 inches through at 9d. per foot. It is principally used for barrel staves, and who can tell but it may yet realise 1s. 8d. to

2s.; in all probability it will do so; and if the thousands of acres of waste land throughout Britain, worth in many cases only 2s. 6d. per acre, were planted, much money would be secured to posterity, and the humidity of our island maintained."

Mr. John Grigor, of Forres, N.B., the author of an excellent *Treatise on Arboriculture*, gives the following instance, among others:—

"On an adjoining moorland on the estate of Dalvey, about four miles from Forres, there is a plantation of native Highland Fir, about forty-five years old, and which has been carefully thinned. The value of the thinnings cannot be now ascertained, but the trees as they stand are worth £50 per acre on land which under any other circumstances would not have fetched nearly £1 per acre per annum."

I could give many similar quotations. There are also many interesting reports on the value of Larch plantations, showing much greater returns per acre than any I have given from Scotch Fir.

Mr. Michie's remarks on the thinning of Scotch Fir I must leave to practical foresters, whose opinions will carry equal weight with his. I would merely remind him that Scotch Fir requires less space for its growth than any other trees, and that the value of thinnings differs greatly in different localities; in some even the smallest are readily disposed of, while in others they are unsaleable.

There is also a wide divergence of opinion as to the proper age at which woods should be cut down, and different localities and soils, and exposures, require different treatment. If Mr. Michie would give us authentic statements of the sums realised from time to time per acre from the plantations which have been cleared on the Seafield properties, he would do more service by giving us the use of such valuable experience than by calling in question the experience of other foresters, and thereby, it may be, checking the profitable occupation of the large extent of waste land which at present lies almost useless throughout the country. *Wm. Baxter Smith, 4, Salcombe Villas, Merton, Surrey, Jan. 1.*

## Florists' Flowers.

**SEASONABLE NOTES ON GREENHOUSE FLORISTS' FLOWERS.**—**BOUARDIAS.**—A few of these will still continue to produce flowers in a warm conservatory or greenhouse. Their flowers are very useful now, few things being better adapted for small vases or bouquets. It is very desirable to retain the plants in flower for as long a period as possible, and one way of doing this is to place the earliest plants that flowered in September or October in heat, say the first week in January or even earlier. Those who have not the convenience of a forcing-house, may place the plants in an early vinery: this would be started with a moist heat of 45° at night, rising a degree or two every week, which would do well for the Bouvardias, and the plants are generally grown sufficiently to produce cuttings before the roof is covered with leaves. Propagate and treat as advised last month.

### CALCEOLARIAS.

Much the best place for Calceolarias at the present time is on a shelf or stage near the glass in a house or pit from which the frost can easily be excluded by means of hot-water pipes; no soft-wooded plants suffer more readily from the effects of over-heating the hot-water pipes than these: it will cause the oldest leaves to droop, and usually causes greenly to appear on them. Many persons have only a greenhouse in which their plants must both be grown and flowered: such persons must scheme a little, and either raise the plants on pots near the glass, or place them on a shelf suspended over the path from the rafters overhead. Carefully look over the plants about once a fortnight, turn each round and look well under the leaves, and remove all those that are decayed, and if one solitary aphid is observed fumigate at once. Large plants should have their growths tied or pegged out, and any plants that require repotting should be attended to at once.

### CHINESE PRIMULAS.

In dull damp weather Chinese Primulas have a great tendency to die off at the collar. When they are arranged amongst other flowering plants in the greenhouse at this season, it is always difficult to give each particular plant just the treatment it

requires; but choice Primulas of this type well deserve to be placed in a light position near the glass, and also where they can have 5° higher temperature than Calceolarias at this season. Water with rain-water rather warmer than the temperature of the house, and with careful attention as to ventilation few or none will damp off. Should any decay appear near the collar of the plant remove it with the fingers, and rub the affected part with dusty quick-lime.

### CINERARIAS.

The earliest plants are now in full beauty, and very useful they are with their brilliant colours when the Chrysanthemums are over, and few of the forced flowers are yet in. These do not require any more attention at present than just to see that the plants do not suffer for want of water, that they are kept free from greenfly, and are not placed where there is a draught of air blowing directly upon them. In a cool moderately dry house they remain in perfection for a very long time; the different shades of blue furnish us with flowers for cutting at this season that are very valuable indeed, but nearly all of them are well adapted for bouquets or vases. Plants intended to flower later, if not yet potted into their flowering pots, should be set to without any delay; the young growths must also be tied out as they require it. Decayed leaves must be carefully removed, mildew destroyed by dusting with flowers of sulphur, and aphid and thrips annihilated by fumigation. On no account let any plant suffer for want of water at the roots. Keep the foliage dry.

### CYCLAMENS.

It is now a good time to sow the seeds of Cyclamens, using pots or pans according to the quantity to be sown. The pans may either be placed on a shelf near the glass in a temperature of 50° to 55°, or they may be plunged in a gentle bottom-heat; when the seeds vegetate it is best to place the pans near the glass, and when the small plants have formed one leaf they may be potted singly in thumb-pots, using light sandy soil, still keeping the plants near the glass and in the same temperature. Flowering plants succeed best in a warm greenhouse, where the attention will be the same as that advised last month. Some of our large plants, six or seven years old, produce a large quantity of flowers, but the leaves and flowers also are very small, and it is better to throw such plants away, and trust to younger ones to produce flowers.

### HYACINTHS.

The whole stock of Hyacinths should now be taken from the plunging material and be placed under glass. Those intended for exhibition on any date from the middle to the end of March should be placed in a pit or house on shelves near the glass, from which frost can be excluded. They must never want for water, but it would be a mistake to give too much of it, on the supposition that plants that will grow in water cannot have too much of it when planted in soil. If it is intended to keep a portion back for exhibition or any other purpose, the pots should be plunged to the rims in some light, dry material in a cold frame facing the north. Cover the glass at nights with mats if severe frost is expected.

### LARGE-FLOWERING PELARGONIUMS.

Where there is a large collection they are continually requiring attention as to tying-out the growths and forming the plants for the next season. Instructions as to how this is to be done were given last month. The plants intended to flower in May and June have of course been potted some time ago; those intended to flower in July may be repotted any time this month. By careful attention to watering and judicious ventilation, the plants are not likely to suffer from "spot;" this is brought on by watering with cold water, or giving too much of it, or from a too low damp atmosphere.

### FANCY PELARGONIUMS.

The fancy Pelargoniums must be carefully trained into shape, and, as previously advised, keep the temperature rather warmer, besides placing the plants at the warm end of the house. The ventilators may be kept rather closer, as the shoots are not so liable to become drawn up weakly as the others. Now is the time to destroy greenfly, or prevent its appearance.

ZONAL PELARGONIUMS.

The plants intended to flower early in the summer should be placed in a house where the temperature is warmer than the greenhouse, say 50° at night. The difficulty with this class of Pelargonium is to get them well in flower for the early exhibitions, and they do not bear much forcing later in the year. Small plants at present in the pots they were placed into in the autumn must not be excited into growth; water very sparingly, and give plenty of air and light.

PETUNIAS.

If it is intended to produce good flowering specimens of Petunias in pots by the end of summer, the plants should now be potted into 5-inch pots from the 3-inch ones in which they have been wintered, that is, if they have started to grow and are forming roots. Immense specimens may be produced if the plants are strong and they are started at this time in a temperature of 50°, and this ought not to be exceeded until the season is well advanced and air can be freely admitted. If the plants have been

A FEW MORE HOLLIES.

We have to thank Messrs. Fisher, Son & Sibray, of the Handsworth Nurseries, Sheffield, for specimens of some very fine new Hollies, which have been raised by them from seed amongst many thousand others of crossed origin, and of two of which we have had the accompanying figures prepared.

*ILEX AQUIFOLIUM PRINCEPS* (fig. 8).—This remarkably grand Holly, one of the finest of which we have any knowledge, was raised at the Handsworth Nurseries, from seed of the Black Holly, *I. A. nigrescens*, crossed with a male seedling from *balearica*. It is a free berry-bearing variety. The wood is of a brownish green; the leaves are broadly oval, 4 to 4½ inches long, and 2½ to 3 inches broad, with strong distant spines standing out directly from the edge with a broad equal base, the edge of the leaf thus forming a series of wide even scollops or indentations, the points of the spines from half an inch to three-quarters of an inch asunder. The leaves are dark green, very stout in texture, with deeply sunk

Holly, and will make a fine and striking addition to the varieties already in cultivation.

*I. AQUIFOLIUM MAGNIFICA*.—This is a grand form of the *laurifolia* type, slightly breaking into the spiny-edged. We understand it is very distinct in the plain-edged series, in consequence of the profusion of berries it produces, *laurifolia* being a sterile variety. The leaves are oval-oblong, dark green, glossy, leathery in texture, 4 inches long by 2 inches broad, with a rather long spiny point, but otherwise usually spineless, occasionally with one, two, or more spines variously placed on the edge. Detached leaves or twigs have somewhat the appearance of Messrs. Paul & Son's *I. A. laurifolia latifolia*, but it is quite distinct, being a berry-bearing form as well as being of a pendulous habit. Messrs. Fisher & Co. inform us that it bears raceme-like clusters of berries sometimes fully a yard long, and some samples they have sent fully bear out this character. Its rapid growth, loose and consequently somewhat pendent habit, and its extraordinarily free berrying property, together make it a very conspicuous variety.

FIG. 8.—*ILEX AQUIFOLIUM PRINCEPS*: UNDER-SURFACE OF LEAF.

FIG. 9.—*ILEX AQUIFOLIUM CONSPICUA*: UNDER-SURFACE OF LEAF.

stunted in the pots it is better to take cuttings now, strike them in a gentle bottom-heat, and make a fresh start.

VERBENAS.

These, like the Petunias, are easily grown, and require rather similar treatment. The plants will be now in store pots, and they should be encouraged to make growth; and as soon as the cuttings are ready they may be taken off and struck in bottom-heat. As soon as the plants are rooted they may be potted into small pots and placed on a shelf near the glass. Greenfly, red-spider, thrips, and mildew all attack the Verbena, and it is needless to say that the plants will do no good unless all these are kept from them. *J. Douglas, Loxford Hall.*

venation, which is very prominent on the lower surface, and which gives the upper surface an almost rugose appearance. In this form the principal veins run outwards at a very obtuse angle. The figure, though not representing the largest size of leaf which has been attained, will yet show that this is a noble Holly, of distinct and well-marked character.

*I. AQUIFOLIUM CONSPICUA* (fig. 9).—This is a distinct and striking form of Holly, with leaves almost as large as those of *I. A. princeps*, but the midrib is distinctly decurved, as in some of the small-leaved sorts, so that the leaves cannot be laid flat. This also is a Handsworth seedling from *nigra*, believed to be crossed with *I. A. ciliata major*. The wood is black or very dark coloured; and the curved leaves vary in shape from ovate to oval, the length being from 3½ to 4½ inches, and the breadth 2½ to 3 inches. The texture is thinner, the colour paler, and the surface more glossy than in the variety just mentioned; the veins are slightly sunk on the upper, prominent on the lower surface, and the teeth are rather more closely placed, seldom exceeding a distance of half an inch, and also directed forwards more towards the apex of the leaf. It is one of the bolder forms of green

*I. AQUIFOLIUM LAURIFOLIA LATIFOLIA*.—This is a large-leaved form of the *laurifolia* type, and makes a fine ornamental Holly. The leaves are elliptical, wider towards the base so as to become ovate-oblong, 4½ inches long, and nearly 2 inches wide towards the base, and 1½ inch towards the top, which is elongated and spiny. We have previously referred to this in noticing Messrs. Paul & Son's High Beech nursery, as a very fine form of the oblong spineless type, with the leaves of a very deep glossy green, and as one of the most striking of Hollies for ornamental purposes.

*I. AQUIFOLIUM MADERTENSIS MIEHO-PICTA*.—A pretty variety, with lanceolate-elliptic leaves, and rather fine and numerous small sharp spines, four or five to the inch, and directed towards the apex, which is elongated. The disk of the leaf is variegated with yellow in large irregular blotches generally extending lengthways, sometimes reaching the margin, at other times confined to the centre, more or less freely associated with smaller patches of greyish-green, the margin sometimes wholly green, sometimes broken up by the colours of the variegation. Sometimes as much as three-fourths of the surface is yellow, rarely as little as one-fourth. The

**BROOMRAPES.**—It appears from a communication made to the Horticultural Society of Paris, that in Persia Melons, Cotton plants, Cabbages, and other plants, suffer so severely from the presence of a parasitic plant allied to our Broomrapes or Orobanches, that popular riots have ensued in consequence of the scarcity thereby occasioned. M. Baillon has determined the plant to be *Pheliprea ramosa*.

average-sized leaves are 3 inches long, and barely  $\frac{1}{4}$  inch wide. This form originated with Messrs. Paul & Son of Cheshunt.

I. AQUIFOLIUM NOBILIS PICTA.—A fine Holly, received from Messrs. Paul & Son, of Cheshunt. It has the broad leaves and bold stout spreading spines of nobilis, and has in addition a slight median variegation of a creamy-yellow colour, much less developed, however, than the variegation in Lawsoniana. T. Moore.

## Notices of Books.

**Aroidæ Maximilianæ.** By Dr. Peyritsch. Vienna, 1879. (Williams & Norgate.) Large folio, coloured plates.

This truly magnificent book, published so soon after Engler's monograph of the order, is devoted to the Brazilian Araceæ, collected and introduced into cultivation through the late Archduke Maximilian, the unfortunate Emperor of Mexico. It has rarely if ever before happened that a book containing so little matter has passed through the hands of so many independent editors as this one. The work was begun by Schott, the well known monographer of this order—by him almost all the descriptions were made, and most of the plates were prepared under his supervision. After his death it was placed in the hands of Dr. Wawra to complete, but owing to the warlike events of 1866 it was, at his proposal, entrusted to Dr. Kotschy, under whose superintendence a few more plates were drawn. At the death of Dr. Kotschy the work passed to the care of M. Reissek, who was the only one after Schott that did much; whilst under his charge the drawings were completed, and he drew up an explanation of the plates. The work was next entrusted to Dr. Fenzl, by whom the text and explanation of the plates were slightly modified. Finally the book was entrusted to the care of Dr. Peyritsch, and by him completed. It is printed in large clear type, on good stout paper, and is embellished with forty-two magnificent coloured plates, representing thirty out of the thirty-eight species described, besides a handsome frontispiece. The size of the book, and the beauty and excellence of the plates—which were drawn by M. Liepoldt—render it a fit companion to Schott's *Icones Aroidæarum*; its only defect appears to be the use of a different language for the habitats and explanations of the plates—these being written in German, whilst the descriptions are in Latin. Of the species figured, *Montrichardia linifera* is the most remarkable; this plant is a marsh, or aquatic species, and has very stout, erect, tapering stems, 6—12 feet high, bearing distant, long petioled, large sagittate leaves; from the axils of the upper leaves arise the large yellowish inflorescences, followed by large, oblong, dark greenish heads of fruit: altogether the plant has a very striking appearance, quite different from everything else in cultivation. *Philodendron imperiale* is also a very ornamental foliage plant, especially in its young state, when the petioles are red and the leaves of a pale chalky-green, marked with small blotches of dark green along the course of the midrib and near the margins. *Zomicarpa Steigeriana*, *Z. Pythonium*, and *Z. Riedeliana* are also striking and interesting foliage plants. N. E. Brown, *Kew*.

**Ceylon Coffee Soils and Manures.** A Report to the Ceylon Planters' Association. By John Hughes, F.C.S.

This book, though somewhat late in its appearance, supplies a want which has long been felt by intelligent Coffee planters in Ceylon. Up to the date of Mr. Hughes' arrival in the island, under the auspices of the Planters' Association, scarcely any analyses had been made of the soils of the different Coffee districts, and all that the would-be proprietor of an estate did when examining the soil previous to purchase was to turn up a few spadefuls to see if heavy clay lay beneath. If none were found, and the climate and aspect were favourable, no further thought was bestowed on the soil until the Coffee trees ten or fifteen years afterwards showed signs of debility. As a consequence of this carelessness of inspection some of the Government lots that were passed over by clever planters as unsuited for Coffee turned out to be exceedingly valuable, whilst others that were

eagerly sought after proved failures. There is no doubt that climate and situation have as much to do with the production of Coffee in Ceylon as the nature of the soil, but at the same time it is quite true that enormous sums of money have been expended in opening Coffee estates that ought never to have been opened. The money has been thrown away because the proprietor would not be at the trouble to consult an analyst as to the suitability of the soil. There was a feeling prevalent amongst planters that if the climate was fairly good they could force the tree to produce good crops by means of manure, and no doubt with high prices and an absence of "leaf disease" such a plan might have succeeded.

In estimating the character of Ceylon soils it is well to remember that the whole island, with the exception of a fragment of secondary limestone on the north-west coast, is composed of metamorphic rocks and their *débris*. In some places there are bands of quartzite disintegrating into a very friable soil, in others isolated remnants of a highly crystalline and much disturbed stratified magnesian limestone. There are no secondary or tertiary strata, no large deposits of older disintegrated rocks accumulated under the action of water, but the primitive crystalline gneiss is found everywhere close to the surface, and almost everywhere it can be seen undergoing the process of disintegration; this disintegration being only slightly in advance of the denudation. With such an origin, and with a rainfall of 100 inches to 200 inches in the year, it is not surprising if the Ceylon soils proved on analysis to be somewhat poor in comparison with those of Europe, or that the application of thoroughly good manure should have been found a vital necessity after a few crops had been gathered. It is in this respect that Mr. Hughes' book is of such great value to Coffee planters. It shows them distinctly by numerous analyses what the Coffee tree requires to keep it in a vigorous crop-bearing condition, as well as in what necessary constituents their soils are naturally deficient. It gives them the relative values of the different manures that are most easy to be obtained on Coffee estates—*e.g.*, castor and cocoa-nut cake, Ceylon cattle and pig manures, Ceylon wood-ashes, Coffee-pulp, Ceylon burnt coral, and magnesian lime, &c., together with the foods that are most valuable for producing their favourite cattle manure. Where the manure applied to an estate may cost year by year £2000 or £3000, a knowledge of what the soil requires may effect an immense saving in outlay. It is much to be regretted that the presence of the dreaded "leaf disease" renders it all but impossible for planters to incur the double expense of fighting their fungoid enemy by means of disinfectants and restoring their exhausted soils to fertility by means of manures, and that it has become a question which of the two is most likely to repay expenditure. When it is remembered that new products, especially Cinchona and Cocoa, are coming very extensively into cultivation in the Coffee districts, and that in districts at a lower elevation Liberian Coffee is being largely planted, the Planters' Association is to be congratulated on the wisdom it has shown, though late in the day, in obtaining a thoroughly scientific opinion as to the nature and capabilities of the soils which its members are engaged in cultivating.

## Garden Operations.

### HARDY FRUIT GARDEN.

In writing the first Calendar of the year for this important department of fruit culture, one's first thought is naturally of the future; and yet however unpleasant the task may be, if still keeping in remembrance the experience of a year which has left sad records behind it, the practical horticulturist cannot afford to lose sight of anything which may serve as a lesson for the future, or which may enable him to grapple with difficulties which appear to grow in magnitude with every recurring season. We have, therefore, while arranging work for the present year, to keep constantly in mind the experience of its predecessor, and, if possible, to render a repetition of the same results less possible by adopting measures which will modify the conditions under which certain classes of fruit trees have been so unproductive, not to say absolutely barren. The first step, and the one that I think the most likely to succeed in the end with any degree of certainty, will be that of a re-adjustment of our present system of wall planting, by which the chosen and more tender kinds of hardy fruit trees will be con-

densed within a more limited area, and covered with glass. On the other hand, there is too much "copying" amongst the general body of gardeners, irrespective of soil, situation, and locality, and that our present system of cultivating hardy fruits is narrowed too much into one groove. Take, for example, the dwarf system of growing Apples and Pears, than which there is no form I admire more where it succeeds; the tops are being continually cut in order to squeeze the trees into the shape of a teacup or a balloon, while the roots are travelling with unbridled liberty. The borders, too, are frequently, and in many cases unavoidably, cropped with vegetables, so that such a thing as surface-fibre is rarely to be found. Thus we have trees restricted in branch-growth and sustained by roots which are continually pumping up crude aqueous matter from the earth much too far from the genial influence of the sun to be healthy; add to this an unprecedented rainfall, with hardly a clear sky for days and weeks, and I think it will be obvious that there is something manifestly wrong in the system, and that many cases of canker and decay may be fairly ascribed to some, if not all, the causes I have mentioned. All that I plead for is that the branches of a tree shall be allowed to extend themselves proportionately with its roots, and that the roots when once formed shall not be cut away to make room for other crops, but be fed and nourished on the surface.

That there will be many vacancies in the hardy fruit garden to be made up is admitted, and there might also be additions made where practicable by throwing an arch over one of the principal walks and growing the trees as cordons. The roots should be confined at first, in order to ensure fertility, and have a space entirely devoted to themselves. The same principle might be carried out on vacant spaces on walls, and the roots could be allowed to extend annually with the tops. With regard to Peaches, Plums, and Apricots that are growing in rich soils it is perfectly certain that, so long as they are allowed to ramble at pleasure through large masses of earth, so long will they cease to bear fruit unless our climate soon changes for the better. Perhaps the suggestion will be taken up, and that a few will act upon it according as circumstances will permit and report results, as I hope to do after a trial: Narrow borders for fruit trees, "all to themselves," and mulched both summer and winter, would at least produce wood more likely to get ripened than that which generally results from our present system. The planting of young trees, if not already done, should be completed whenever the earth is in a fit state for planting. It is always convenient to have a nursery, however small, in every garden where trees can be grown for a year before they are transferred to their permanent quarters. All such operations should be anticipated where weeding out is intended.

Young plantations of Raspberries, Gooseberries, Currants, &c., should also be made where old trees are showing signs of going back, or where a change of quarters will prove beneficial in other respects, and cuttings of approved kinds should be got in readiness and legibly named, so that they may be planted when the weather is favourable. The pruning and nailing of wall trees has fallen into arrears, owing to the severity of the weather; and all preliminary work, such as preparing shreds and nails, and other kindred operations of a routine description, will require to be pushed forward with vigour whenever opportunity presents itself. W. Hinds, *Canford Manor*.

### FLOWER GARDEN, ETC.

Necessarily my notes can only be suggestive of what may be or of what requires to be done at certain seasons of the year, and they are intended to serve as suggestions rather than as models for strict imitation. Every garden has its own special requirements at certain seasons, leaving out of account the difference in weather in the various parts of the kingdom; so that after taking into account circumstances and conditions, each for himself must decide as to what extent the hints and directions here given should be carried out. It may be observed that the rule followed in giving these hints will be that only arising from work actually being done under the direction of the writer. During the prevalence of hard frosts, such as have prevailed now for several weeks past, all heavy carting or wheeling of soil and manure should be done, also grubbing-up of old tree stumps, dead shrubs, and the cutting away of dead boughs or those that intercept or interfere with the growth or appearance of neighbouring shrubs or trees. Shrubbery clumps may also be well cleared out, and the leaves carted to the soil-yard to be thrown together with a little salt or fresh lime to kill insects and render them the more quickly available for manorial purposes. Hedges of Beech, Thorn, and Privet can also be trimmed and ditches cleaned out. We have also been trimming off the straggling growths in clumps of common and Portugal Laurels and Rhododendrons, work that would have been best left till spring, but the pressure of work at that season is so great that we

have had it done now, and having done it for several years previously we do not anticipate any harm; but in parts of the country where the thermometer has receded to zero no such cutting should yet be done, as the probability is that common if not Portugal Laurels will be killed to the ground. As soon as weather permits let all alterations be pushed on, such as making new walks and roads, draining, excavating, or the forming of gardens for Ferns, alpine and herbaceous plants.

In preparing ground for the planting of trees and shrubs no labour should be thought too great; for the reason that when this is well done at first, the plants not only start off vigorously, but no other disturbance or addition of soil is required for years; therefore trench deeply, and manure liberally for even the commonest shrubs. The present is also a good time to render assistance to any favourite trees or shrubs that seem in waning health, by applying surface mulchings of fresh soil and manure. The roots of Coniferous plants soon find their way into dressings of fresh peaty or vegetable soil, and all kinds of deciduous trees are equally sensitive to dressings of a richer nature, such as the refuse soil from Vine and other fruit tree borders. Before applying such dressings it is generally advisable to remove as much of the old soil as possible without disturbing the roots.

In the flower garden proper there is as yet, beyond the maintenance of neatness and order, very little requiring attention. Bulb beds, however, may require some slight protection, such as that afforded by Laurel or Yew spray, and the depredations of mice and rats must be guarded against by keeping traps near the runs of those vermin constantly baited. It is to be feared that Roses have suffered from the severity of the frost. The Noisette and Tea classes that have had no protective mulching will certainly die back to the ground-line, but meanwhile all kinds should be heavily mulched, and those recently planted be securely staked, for without this attention all new roots made would be liable to be destroyed by wind-waving. The reserve stock of summer bedding plants should now be examined, and any that are required in quantity, and the stock of which is short, should have the most favourable positions available for the production of cuttings, that propagation may begin early. As a rule, none but the most tender kinds will yet need additional heat. There are also some few kinds of bedding plants that are generally raised from seed, and which, being of slow development, require to be sown thus early; amongst them are *Acacia lophantha*, *Cannas* in variety, *Centaurea candidissima*, *Echeveria metallica* and *E. glauca metallica*, *Ferdinanda emiensis*, *Gravillea robusta*, *Solanum pyracanthum*, *S. marginatum*, *Wigandia caracasana*, *W. urens*, and *W. Vigieri*. *W. Wildsmith, Heckfield.*

#### FRUIT HOUSES.

VINES.—Under the favourable influence of mild, bright days since the breaking up of the frost, early started Vines have made good progress, and look very promising. As days increase in length they will, under judicious management, soon make up for the time apparently, though not really, lost while passing through the early stages of swelling and bursting their buds; for Vines started in this way invariably produce more compact shows and make better progress than when forced against Nature through the dark month of December. Vigorous young canes that have been suspended over fermenting material should be tied up to the wires as soon as the most backward buds have pushed freely from the rods. Proceed gradually with disbudbing, and tie down the young growths before they touch the glass. Stopping, like forcing with or without bottom-heat for the roots, is a matter of great importance with some growers, while with others the first or fourth joint answers equally well. In my own practice, where the Vines break and grow away evenly, I prefer stopping to the third or fourth joint beyond the bunch, providing there is space at command. After this I allow the laterals to extend until I have sufficient wood to cover every available part of the trellis with fully developed foliage, when the strongest points are again stopped to prevent overcrowding. As the bunches become prominent the house may be kept a few degrees warmer—say 58° at night, with a rise of 10° to 15° by day from fire-heat, allowing it to run up to 80° under the invigorating influence of gleams of sunshine. If fermenting materials are used on inside or outside borders, and good Grapes can be secured by their use, the prudent grower will unwillingly depart from the route that has safely landed him across the stream, and in this case attention must be paid to the temperature, which will not vary much where the border has been kept well covered with dry Fern and shutters up to the time that a body of dry warm Oak leaves were substituted for the Fern. Succession houses from which ripe Grapes are to be cut in June will have been closed and well watered with water at a temperature of 90°. Syringe the rods twice a day with warm water, taking care to wet every part of

the wood, and allow the night heat to range from 45° to 55° on mild nights, with 10° more by day. As a means of economising the use of fuel, introduce a good heap of Oak leaves, to which one-third of short stable manure has been added: turn it frequently, and make additions as the heat declines. If not already done late Grapes may now be cut and removed, that the Vines may be cleansed and allowed to rest. Although I have never perceived any difference in Grapes taken from Vines that have bled after pruning, the application of a little styptic to the fresh cuts is so simple that its use after the turn of the year is always advisable. When the Vines, glass and walls have been properly cleaned the inside borders should be cleared of all exhausted mulching, and top-dressed with a thin layer of turfy loam, crushed bones, and rotten manure over all. The outside borders that have been covered up all the winter may also be exposed to the influence of the weather, leaving a slight covering only of litter to keep out frost. Fruiting pot Vines placed in or over fermenting material may be kept warmer and drier as the bunches come into flower. Tie down and stop young growths, and afterwards allow them to grow until every part of the trellis is covered with foliage. Select thoroughly ripened wood for eyes, and insert in pots or sods at once; if for fruiting canes, no time should be lost in getting them into heat. *Wm. Coleman, Eastnor.*

#### MELONS.

From plants raised from seeds sown now, ripe Melons may be cut by the end of April or beginning of May, providing everything goes on satisfactorily with them, and that the weather continues favourable to their growth. The seeds should be sown singly in 60's in light fine loam and leaf-mould, leaving room in the pots for top-dressing when the plants require it, plunging them to the rims in a hotbed made of fermenting materials as recommended in our last Cucumber Calendar, and covering them with a piece of clean glass, which, however, should be removed as soon as the plants appear through the soil. When they have made 2 inches of growth they should be top-dressed, still keeping them as near the glass as possible without touching it, to prevent their becoming drawn. Should the frame upon looking into it in the morning be found rather full of steam, arising from the fermentation of the dung and leaves, it will be advisable to leave sufficient air on at night to allow of its escaping, otherwise probably the young plants would damp off; but where the young plants are raised under more favourable circumstances there need be no apprehension in this respect. If the pots are placed on a shelf near the glass in a fruiting Pine-stove or Cucumber-house, with a piece of glass, as above stated, placed over the pots, the object in view will be satisfactorily attained. However, should any one lack the accommodation referred to above the necessity of the case will in this, as in sundry others, suggest a means by which the difficulty may be surmounted. As to varieties most growers have their own well tested sorts; however, I may remark in conclusion, for the guidance of those who have not, that Eastnor Castle, Scarlet Gem, and Victory of Bath Improved are three excellent early varieties. *H. W. Ward, Longford Castle.*

#### CUCUMBERS.

Young Cucumber plants must be got ready now for the early spring supply of fruit. For this purpose there are none better than Rollisson's Telegraph, if any so good, notwithstanding the numerous varieties of recent introduction. The seeds should be sown singly in large 60-pots (which is better than sowing several in one pot, thus subjecting them to a check in potting off), in a rich light mould, leaving room for top-dressing the plants when they require it, and plunge in a brisk bottom-heat—which the hotbed recommended to be made in last Calendar will now be in a position to supply—near the glass, and cover with a clean piece of glass, which must be removed as soon as the plants come up. Maintain a genial atmosphere with a night temperature of from 65° to 70°, according to the nature of the weather—running up from 80° to 85° with sun, putting air on on all favourable occasions. Let the tying and arranging of the shoots, &c., be attended to as occasion may arise. *H. W. Ward, Longford Castle.*

#### PLANT HOUSES.

FERNERY.—The fronds of Ferns being now in a mature condition, it will be a good time to go over the stock of plants and give them a thorough cleaning, as they will bear stronger doses of insecticide while at rest than it would be safe to apply at any other season. In the case of those infested with thrips, if they happen to be growing in pots, the most expeditious and best way to eradicate these pests is to dip the heads in strong tobacco-water, to each gallon of which an ounce or so of nicotine soap should be added—a mixture that will then be very potent and sufficiently strong to kill the eggs as well as the insects. The practice of removing the fronds with a

view of getting rid of the insects is bad, as so long as there is life in them they are of great use to the plants, which require their aid till the young ones are in an advanced stage to replace them, and it is only then that they bear the loss without being injuriously affected. It often happens, however, that the tree kinds grow too robust for the positions assigned them, and in order to restrict these and check any undue luxuriance it is sometimes necessary to apply corrective measures, the simplest and most effective being to remove some of the soil around the stems and cut their roots close to the same, and then fill in with poorer stuff containing some soft porous brick broken small, or some cinders rammed in firmly, either of which will help to drain away the water and keep the mass in a sweet healthy state. In cases where plants may have become too tall for the houses they are in, it is a very easy matter to cut through the trunks and reduce them to the desired height by dropping them down, which, if done at once before they start, is a safe operation, especially in case of such kinds as *Cyathea medullaris*, *C. dealbata*, *Dicksonia antarctica*, *Cibotium princeps*, and such as are generally provided with plenty of young feeders up the entire length of their stems. After being treated in the way above-named and replanted it will be necessary to keep them frequently syringed in order to prevent the fronds from flagging, but in doing this the less water there is allowed to soak into the soil, till the bottom of the trunk is healed over a bit, the better, as otherwise there is a risk of that part rotting, to prevent which it is a good plan to stand it on some dry dusty charcoal and sand, as the absorbent properties of these assist the plant very materially in callusing over the wound. Where Ferns are grown on the natural system it will be found that there is much shrinkage of the soil from the sides of the pockets in the artificial rock, which requires seeing to at this season and the crevices filling, for if these are allowed to remain the water drains away at such a rate that the roots receive but little benefit from it. A stout stick made wedge-shaped is the best instrument to use to thrust in and search out these cavities, which can then be made good with fresh loam and peat, and a surface-dressing given to each plant, which will be a great assistance to them by-and-bye when they make a fresh start.

#### CONSERVATORIES.

For Conservatories to be really enjoyable and suitable for the many forced things that will soon be coming on, it will be necessary to maintain a temperature varying from 50° to 55°, in which most flowers will expand properly and last a long time in perfection. Camellias, however, object to such a degree of heat, and therefore if there happens to be many of these it will be better for them to be kept 5° or so lower, especially if the atmosphere is at all dry, which prevents the swelling of the buds, and is a frequent cause of their falling. To aid these in opening out fully, clarified soot-water is a fine thing to give, and is preferable to most kinds of liquid manure, as it is almost inodorous and has a safe stimulating effect, imparting at the same time a healthy deep green to the foliage. Roof climbers will now soon be on the move, and in cases where the border room is of too limited an extent it will be advisable to remove a portion of the old inert soil and give the roots some fresh turfy loam, after which a good soaking will settle it down and encourage the plants to feed on it at once. Such things as *Passifloras* and *Taesonias* that bear their flowers on the young growth, may with advantage be thinned out considerably, as not only will they be benefited thereby and made to break back, but the pruning away of superfluous shoots will let in the light and air so much needed by the occupants beneath. Beautiful and desirable as are *Taesonias* in all conservatories, they are about the worst thing possible for scale, and unless these pests are kept down it is surprising how soon they spread themselves over the bark. The quickest and best remedy to hold them in subjection that I have ever found, is to paint the stems with some of the insecticides, mixed at the usual strength, with the addition of a little clay to give it consistency, which smothers the enemy and holds the plants clear for the rest of the season. The white kind that infests *Lapagerias* is not so easily dealt with, and the only safe way is to hand-sponge the leaves, in doing which great care must be exercised, as owing to their hard brittle nature they are apt to break or become damaged near the stalk when turning them up or down to get at them. Camellias, too, are sometimes subject to this same species of scale, but more frequently the brown turtle scale, which gets on the wood, and by its excreta, so freely exuded, soon covers the foliage with a sticky black mass. If the plants are in pots they may be readily dealt with by laying them on their sides and syringing them with dilute nicotine soap, which, so far as I have had experience of it, seems the best of the various insecticides. When this or any other is used the great thing is to keep it out of the soil, where, if it soaks in, damage is done to the roots. *J. Sheppard, Woolverstone Park.*

## APPOINTMENTS FOR THE ENSUING WEEK.

MONDAY,	Jan 12	Sal. of orchids, at Stevens' Rooms
TUESDAY,	Jan 13	Royal Horticultural Society Meeting; of Fruit and Floral Committee, at 11 A.M.; Scientific Committee, at 4 P.M.
WEDNESDAY,	Jan 14	Sal. of Roses, Fruit Trees, Shrubs, &c., at Stevens' Rooms
THURSDAY,	Jan 15	London Royal Botanical Institution Annual Meeting
		Sal. of Linnæanatum, &c., at Stevens' Rooms
		Linnæan Society's Meeting, at 8 P.M.
SATURDAY,	Jan 17	Sal. of Hardy Plants, Roses, Bulbs, &c., at Stevens' Rooms

IN this great country, where the arts and sciences flourish, not because of imperial patronage but rather in spite of it, it would doubtless seem incongruous were any illustrious worker in horticultural pursuits to receive any special notice at the hands of the powers that be, or any of those honours that are so eagerly sought for by the fighting services of the country and so freely bestowed, yet it is difficult to repress a feeling of humiliation that so little national recognition is given to the services rendered to the nation in general by other than Government servants, and to horticultural science and practice in particular, by such men, for instance, as ROBERT FORTUNE—a record of whose introductions from the far-off countries of China and Japan appeared in these pages last week. It is not possible to calculate the benefits the country has received from Mr. FORTUNE'S labours; they were quiet, plodding, and unpretentious, carried on too often perchance under great privation and possible danger to life. None of the clash and pomp of war shed a halo over his work; there was no wading through slaughter, or records of thousands and tens of thousands of dead defenders of their hearths and countries to chronicle. It is the men who can boast of these trophies of civilisation! that get the popular cheer, the national welcome, and the imperial honours, whilst the unpretentious seeker after good, like FORTUNE, finds his reward only in the almost utter forgetfulness of the nation that such a man ever was its benefactor. Yet FORTUNE'S testimonials, silent but impressive, are found amongst us in their thousands; they exist in abundance in every garden, and are found now almost throughout the whole civilised world. Wherever a love for flowers and trees is, there also are the abundant evidences of his labours. Not to carry into aboriginal homes death and desolation was his mission, but rather to give comfort, beauty, and life to all humanity. By-and-bye, perchance, when the grave has closed over his earthly career, the world will realise how much it owes to ROBERT FORTUNE.

A GARDEN VIEW IN GLOUCESTERSHIRE.—In our last volume (p. 725) we gave a view in the flower garden at Blize Castle, Henbury, near Bristol, the seat of Mrs. HARRIOT, the laying-out of which place, it will be remembered, was to some extent accomplished by REPTON. On the opposite page we give another illustration of a striking bit of scenery from the same place. Leaving the flower garden previously illustrated, the visitor passes the front of the Castle, and follows the guide along a winding walk through the grounds leading by a steep ascent to a hill, on which stands a tower, erected about 1768 on the site of an old chapel. From this point is obtained one of the finest views in the kingdom, extending over the Severn channel to the Glamorganshire hills, and over a vast extent of country in every direction. On the south side of the tower the ground terminates in a precipitous descent into a deep gorge some 200 feet below, and which forms the subject of our present engraving (fig. 10). On the opposite side

of the gorge, which is almost as steep, there is a group of rocks known as the Giant's Arm-chair, to which, as usual with these mythical personages, a legend is attached. In the bottom there is a pool of water, and the sides of the gorge are thickly clothed with trees, rising tier upon tier above each other; and the view, as seen from the Castle side of the ravine, is far the most picturesque that we have seen in the West of England.

MR. SPENCER LE MARCHANT MOORE has resigned his appointment as Senior Second Assistant in the Herbarium of the Royal Gardens, Kew.

PROFESSOR ARCHANGELI, late of Florence, has assumed the direction of the Botanic Garden of Turin.

A PRESENTATION TO KEW.—Mr. B. DAYDON JACKSON, F.L.S., has presented to the Royal Gardens, as "some slight acknowledgment of the help which at various times I have received from Kew," a microscope by CROUCH of the most approved pattern, with 1 inch,  $\frac{1}{2}$  inch, and  $\frac{1}{3}$  inch object glasses. The instrument was offered in the first place for the use of the Jodrell Laboratory, "or if that is already supplied," of the herbarium. The Jodrell Laboratory being well equipped with microscopes, through the munificence of the founder, Mr. JACKSON'S microscope has been placed in the herbarium.

ARIS VEITCHII.—Messrs. VEITCH advise us that they have in cultivation the true *A. Veitchii*, and which is, as was originally stated, a very remarkable species. In reference to the subject of Japanese Conifers we may allude to a slip of the pen at p. 283, where the word *nephrolepis* is erroneously written for *selenolepis*.

BELGIAN NATIONAL EXHIBITION.—We learn that it is proposed to erect at Brussels, on the occasion of this exhibition, a large glazed structure, the interior of which will be arranged as a picturesque winter garden, with rockwork, grottos, &c., as at the exhibitions at Florence, Cologne, St. Petersburg, &c. Outside will be a picturesque garden for hardy plants, shrubs, &c. The exhibition will remain open from July 21 to July 28.

THE "JOURNAL OF BOTANY."—Owing to the appointment of Dr. TRIMEN to the post of superintendent of the Botanic Garden, Petadenyia, the editorship of this useful periodical has been confided to Mr. JAMES BRITTON, of the British Museum.

HYBRID BROMELIAS.—At a recent meeting of the Central Horticultural Society of France M. DANZANVILLE'S exhibited a hybrid between *Bilbergia amœna* as seed parent and *B. Leopoldi* as pollen parent. The habit is described as that of the latter plant, while the seed parent shows itself in the coloured bracts.

ON AND OFF DUTY.—Our wandering correspondent, Captain OLIVER, to whom these pages owe several illustrations of exotic vegetation, the last of which was the singular and beautiful *Pandanus*, figured at p. 820 in our last volume, intends to publish a work with the above title early in the present year. It will contain notes of travel in China, Japan, Madagascar, &c., with illustrations by the author.

PHILLYREA VIMOREANA is, according to M. LAVALLÉE, a dwarf hardy evergreen shrub, with large lanceolate leaves. The habit is globose. The form is not generally known in this country.

THE SOYA BEAN.—According to an analysis published in the *Bulletin of the Central Horticultural Society of France* the seeds of this plant, *Soya hispida*, are considerably richer in nitrogenous and fatty matters than other pulse. It would seem, therefore, to be well worth growing in warmer latitudes than ours.

THE REGISTRAR GENERAL.—Some explanation is surely required of the Government for their action in passing over the accomplished statistician, Dr. WILLIAM FARR, and in appointing a gentleman to the task whose qualifications have to be proven. Dr. FARR'S European fame and his brilliant services should have secured him from such an indignity.

ARTIFICIAL DIAMONDS.—Mr. NEVILL STORIE MASKELYNE has rather summarily dispelled the notion that the crystals produced in the St. Rollox Works, Glasgow, were really diamonds, but he does not doubt that the ordinary opaque black condition of carbon may ultimately be permuted into the limpid crystal of the diamond, only it is not done yet.

"THE GARDEN ORACLE."—Oracles generally give dubious utterances, but such is not the case with Mr. SHIRLEY HIBBERD'S Oracle. It speaks plain. It tells us of the Creed of St. ATHANASIUS to begin with, and of WRIGHT'S Endless Flame Impact Hot-water Boilers to end with. What there is between may fairly be inferred to be varied in character. If we did not think it useful also we should not, as we do, recommend it to the notice of our readers. It may be had at 11, Ave Maria Lane, Paternoster Row.

HYBRID GEES.—Mr. DARWIN communicates to *Nature* an interesting case, in which hybrid birds, the offspring of two distinct species, have proved quite fertile *inter se*. The common goose and the Chinese goose are so distinct that they have been placed in different genera or sub-genera: nevertheless they interbreed, and their offspring prove fertile. Mutual sterility is therefore shown to be no safe or immutable criterion of specific difference. We have, however, Mr. DARWIN remarks, much better evidence on this head, in the fact of two individuals of the same form of heterostyled plants (those in which the style varies in length in different flowers) which belong to the same species as certainly as do two individuals of any species, yielding, when crossed, fewer seeds than the normal number, and the plants raised from such seeds being, in the case of *Lythrum Salicaria*, as sterile as are the most sterile hybrids.

CHARLES FORTUNÉ WILKERMOZ.—French papers record the death of this gentleman, one of the founders and the General Secretary of the French Pomological Congress.

PORTRAIT OF MR. ROBERT MARNOCK.—We regret to find that by a printer's error in our notice of the presentation of this portrait, at p. 16, Mr. MARNOCK'S name is misspelled MARNOCH. Fortunately, Mr. MARNOCK is so well and so widely known, that many of our readers will have made the correction for themselves.

CROSS FERTILISATION.—Dr. ERNST of Caracas reports in *Nature* the result of some observations on *Melochia parviflora*, some plants of which have long, others short styles (heterostylism). Dr. ERNST grew plants of both kinds in his garden, and experimented on them with the view of ascertaining their relative degrees of fertility when intercrossed. When a long-styled form was fertilised by the pollen from a short-styled or long-stamened form, all the flowers produced capsules, each containing five seeds. Corresponding facts were observed when short-styled flowers were fertilised by pollen from long-styled forms. But when the long-styled or short-styled flowers were fertilised with their own pollen respectively, the number of capsules and seeds was observed to be less. The favourable influence of cross-fertilisation is evident, as in no other case did the average number of seeds per capsule reach the normal number.

LARGE ORANGES.—We have received from Mr. JAMES WOOD, seedsman and florist, of Newport, Isle of Wight, a couple of large Oranges, which together weighed 2 lb. 8 oz. The largest one weighed 1 lb. 7 oz., and measured 18 inches in circumference. Mr. WOOD states that they were grown with two others of about the same size on a tree about 3 feet high, and 2 feet in diameter of branches, standing in a cool house from which frost and damp are excluded by the use of fire-heat. They are very handsome as decorative objects, but quite useless for dessert.

THE LATE SEVERE WEATHER IN FRANCE.—The Paris correspondent of the *Times* quotes a paragraph from the *Temps* to the effect that the late frost has done great damage to trees and shrubs, especially Pines, Cedars, Planes, &c. In the forest of Montmorency several hundred hectares of Chestnuts have been killed. Laurels and other evergreens have been greatly damaged, the leaves wherever not

covered by the snow having turned brown, and many shrubs are not likely to recover. Game has also suffered. A gamekeeper in Sologny picked up in one day twenty-three dead partridges; in the north the partridges have all been destroyed. In a forest in the east four fine wild boars have been found dead from starvation, and in the forest of St. Germain roedeer quite exhausted have been killed with sticks by the peasants. Birds of prey have been unusually rapacious. At Ferrières a number of ravens pursued a hare which, when picked up half dead by a passerby, had an eye plucked out and a large wound in the side.

— THE INTERNATIONAL POTATO EXHIBITION. — With a desire to secure in the class for new varieties *bona fide* seedling sorts it is, we hear, purposed at the next show to create, in addition to a class for new varieties in commerce, one for new kinds not in commerce, the pedigrees of which must be shown in writing at the time of entry. This is, without doubt, a step in the right direction, as the great difficulty hitherto in adjudicating upon new kinds has been the lack of evidence—beyond in some cases clearly defined distinctiveness—that the kinds staged in competition really were what they were represented to be. Raisers will thus learn to record their crosses in future, just as a very few have done in the past; and then some few years hence we may be able to trace the ancestry of any new kind for several preceding generations.

— CALANTHE VEITCHII.—A recent visitor at Londesborough Lodge, Norbiton, informs us that there is at present a wonderfully fine display of this grand Orchid in one of the houses at that place. The plants are suspended from the roof in a double row, and being intermixed with fine-foliaged plants they have a grand effect. There are upwards of one hundred plants with fine spikes, and the flowers of a good colour too. Where a supply of cut flowers is in demand through the dreary winter months nothing can suit better for this purpose than *Calanthes* as they are grown by Mr. DENNING.

— THE WEATHER IN THE NORTH OF LONDON IN 1879.—Mr. DUFFIELD has sent us, from Winchmore Hill, nine miles north of London, a record of the temperature and rainfall registered there during the past year, from which it appears that the total rainfall was 32.65 inches, the greatest amount which fell in any one month being 5.03 inches in August, and the smallest 0.50 inch in November. The average mean temperatures for the different months were as follows:—Jan., 31°.7; Feb., 37°.6; March, 40°.7; April, 43°.0; May, 47°.8; June, 56°.8; July, 57°.8; Aug., 62°.1; Sept., 55°.5; Oct., 49°.8; Nov., 39°.6; Dec., 32°.1—in every case less than in the corresponding months of 1878.

— SELAGINELLAS AND LYCOPodium FOR WINTER DECORATION.—At Combe Abbey Mr. MILLER is able to illustrate in a remarkable degree the great value of these plants, as most useful subjects for decoration and other purposes in winter. Availing himself of a somewhat narrow, unoccupied space between two houses, he covered this with a low glass roof, and warming it so that there should be no lack of a suitable temperature, he here grows an excellent collection of these plants, that are very interesting in addition to being serviceable at this season of the year. The greater part of the plants are on, or slightly raised above the ground level, and while all the green types were healthy and luxuriant, the variegated forms were particularly pleasing. Mr. MILLER asserts that the variegated forms take on their best character during the winter, and that all mosses ought to be so managed as that they should be at their best in the winter season. Selaginellas are in strong force at Combe Abbey, there being a large and varied collection; especially good were the variegated forms of *S. Kraussiana*. One, under the name of *S. umbrosa*, had the foliage tipped with white, and from the smallest to the largest plants, whether in large pans or small pots, they were most effective. *S. inequalifolia* is a strong and graceful species, very handsome in the mass. *S. Warszewiczii* is a form that rests in summer, but in winter it comes handsomely tipped with gold, when it is very pretty. The variegated form of *S. denticulata* was very fine indeed, growing in large pans on mounds of soil, principally of peat, raised above the rims of the pans to the depth of 4 or

5 inches. For winter culture, the pans and pots of mosses are nearly filled with broken crocks and charcoal, with a surface of a free sandy soil. The plants are apt to be affected with damp in winter, but the maintenance of a brisk warmth and a constant oversight keeps this under. Their value for cutting from during winter cannot be too highly estimated.

— THE VERBENA AS A GARDEN PLANT.—We sometimes hear the Verbena spoken of as a plant that is declining in cultivation, but the extent to which it is propagated by some firms who make it a speciality, shows that it is yet in very large demand. Messrs. KEYNES & CO., of Salisbury, grow during the season from 50,000 to 60,000 propagated plants of Verbenas. During the summer, plantations of the leading sorts are made in the open ground, and from these cuttings are taken in August, as soon as convenient, which are struck in heat, and put into small 60 pots. Later cuttings are put into store-pots, five or six in a pot, and the plants kept in frames, giving fire-heat when necessary. In spring plenty of cuttings are forthcoming, and plants are increased almost indefinitely. These are so managed that there are always supplies of fine young stocky plants ready for sale from March onwards. The demand for the Verbena for bedding purposes is said to be very large.

— KNIGHT'S PYRAMIDAL LAURUSTINUS.—After a spell of severe frosty weather that has severely tried the endurance, and there is reason to believe irretrievably injured some at least of our hardy shrubs—the young late growths of the common Laurel having been sorely punished—it is well to notice something that can lay claim to rare hardihood of character. This *Laurustinus* is an illustration of the possession of this quality; it is hardier than the common form, which is a great recommendation; takes on a handsome pyramidal habit of growth, while the trusses of bloom, as well as the individual flowers, are larger than in the case of the common *Laurustinus*. It will be some time before we shall fully realise the damage wrought, not so much by the keen frosts, as by the cruel blasting winds of the first week in December, and especially on the 4th of that month. The walls at Chiswick show many traces of the deadly influence of these winds, the Escallonias in particular having been much damaged. The variegated *Aucuba*, even in the coldest and most exposed positions about London, shows no traces of the elemental strife, and is at the head of our hardy evergreen shrubs.

— ABIES ALBERTIANA.—The last number of the *Journal of Forestry* contains the measurements of a fine specimen of this ornamental tree growing at Leslie House, Fife, which is stated to be a model of symmetry. Its height is 40 feet 6 inches; its girth at the base 3 feet 3 inches; and the circumference of its spread of branches 78 feet.

— ORIGIN OF THE ADVENTITIOUS ROOTS AND BUDS ON LEAF-CUTTINGS OF PEPEROMIA.—The changes which take place in leaf-cuttings of *Peperomia*, and the processes of the formation of new plants, have been investigated by E. BEINLING, and published in COHN'S *Beitrag zur Biologie*. As in most cases, the cut surface is first covered with a callus, or corky tissue, through which the rootlets afterwards emerge. In about ten to fourteen days small whitish elevations appear on the cut surface; these are buds, or the beginnings of new plants. They originate in the fundamental tissue of the stalk and blade of the leaf, and are therefore exogenous; the origin of the first rootlets, on the contrary, is endogenous, as they proceed from the cambium region of the vascular bundles.

— THE SHOW-HOUSE AT KEW.—A correspondent in another column calls attention to the poor cultivation exhibited in the decorative house at Kew. Those indeed who have but a short time to spend at Kew, or who have no other special object in view, generally make their way first to No. 4, "to see what is in bloom," and it rarely happens but that they find something of interest. The rafters, especially at some seasons, are noteworthy, as they are clothed with some of the rarer and more beautiful climbing plants. But as No. 4 is the show-house, where purely botanical considerations are set on one side in favour of what is more generally attractive, it is, as our correspondent justly points out, disappointing to find the "cultivation" of the plants so very inefficiently

represented. The staple decorative plants lately have been some small plants of *Azalea amena*, some straggly *Chrysanthemums*, wretched *Poinsettias*, and a host of scrubby Chinese *Primroses*, *Mignonettes*, *Lobelias*, *Pelargoniums*, and such-like, which would not be tolerated in a small private establishment. While there are such multitudes of lovely Cape and New Holland plants, which are but little known to gardeners, we own that we should prefer to see them at Kew in preference to plants which one can see vastly better "done" in Covent Garden Market. But as the general public, who supply the funds, are not yet educated beyond *Pelargonium* point, it is requisite and right to provide for their delectation. To our thinking, it would be a waste of money, energy, and time to enter largely upon matters of pure decoration at Kew, where so many and more important matters have to be attended to; but if a show-house is maintained at all it should be thoroughly well maintained, and the cultivation of the plants in it should be such as to furnish a model and example to gardeners and amateurs. A well-grown specimen (even from an educational point of view—a matter always to be borne in mind at Kew) is far more instructive than an imperfectly developed or poorly cultivated scrub.

— FURNITURE WOODS IN MILAN.—In a recent report on the industries of Milan some interesting details are given on the utilisation of timber for building, art, and domestic purposes. The manufacture of furniture is an important industry in the province. The common furniture is nearly all made in the villages of the Upper Milanese, in the district of Monza. The woods used for the outer surfaces are Walnut, Cherry, and Pear; for the linings, Poplar and Alder. In the town of Monza, tables, chairs, sofas, wardrobes, and other articles are made; and not only of common wood, as was formerly the case, but of finer kinds. In the surrounding villages makers confine themselves to some special articles—thus, in the village of Mede, chairs, sofas, and tuskis only are made; at Lessone, beds, tables, *cassellons*, &c. Excepting at Monza, where the furniture is entirely finished, the articles made in the other communes, on commission, for the Milan dealers, are always in the rough, being finished by the wholesale purchasers, by whom they are sent for sale in large quantities to the other cities and principal towns of Lombardy, as well as to Venice, Parma, Piacenza, and elsewhere. The furniture made is solid, of good appearance and cheap. This industry in the territory of the Upper Milanese gives employment to some 3500 operatives, of whom about 500 are boys. Furniture of superior quality is made only at Milan, where articles of all descriptions are manufactured, carving, *intarsiatura* and buhl work being largely used in ornamentation. The woods employed are Mahogany, Indian Walnut, Ebony, Rosewood, foreign Maple, Hungarian Ash, &c., with sometimes Walnut roots, and of late years Oak for dining-room furniture. The fine and finest Milan furniture enjoys considerable reputation. It is solid without being heavy in reality or in appearance; the work is good, well joined, well finished, and carefully polished; the woods are well seasoned, and put together with intelligence, so that they do not suffer from time or variations of climate. There are from 100 to 120 makers of first-class furniture in Milan, who give employment to not less than 2000 workmen, including boys. Much artistic furniture, carved or inlaid with tortoise-shell, or decorated with porcelain medallions after the French fashion, is also made, but for carved work it is acknowledged that Tuscany has the pre-eminence over Milan.

— THE RAINFALL AT LEONARDSLEE.—Mr. SIDNEY FORD has sent us an account of the rainfall last year at Leonardslee, Horsham, Sussex, from which it appears that the total for the year was 36.50, an excess of 4.12 inches over the amount which fell in 1878. The heaviest falls occurred in June, 5.45, and August, 5.62; and the lowest in December, 0.81. The average rainfall at Leonardslee during the last ten years is 31.86 inches.

— MENTZELIA ORNATA BEHEADING FLIES.—Some time ago Mr. J. POISSON published in the *Bulletin de la Société Botanique de France* an account of some observations on the behaviour of *Mentzelia ornata* towards flies and other insects, of which we are reminded by seeing an abstract, by Dr. A. GRAY, of the paper in question in COULTER'S *Botanical*

*Gazette.* We reproduce Dr. GRAY'S abstract. It is well known that the roughness of *Mentzelia ornata* and other Loasaceæ is owing to the stiff bristles of the surface being provided with an armature, at certain points along their length, of retrorse barbs. There are three or four whorls of these barbs, and four or five barbs to a whorl, on the larger bristles; in the smaller there is only a terminal whorl of barbs, in the manner of a hooked bristle. Mixed with these harpoon-like bristles are some soft ones tipped with a capitate gland, and which secrete a viscid matter attractive to insects. It appears that flies so attracted thrust in their snouts between the thickly set hooked bristles to feed upon the secretion of the glands between and below. The retrorse barbs interpose no obstacle to this; but when the proboscis is withdrawn, its dilated and cushion-like tip catches in the barbs, and holds all fast. The harder the backward pull, the firmer and the more extensive the attachment to the sharp barbs: the wounded and impaled organ becomes congested and swollen; and the insect is seldom able to disengage itself. Especially is this the case with the larger flies. Some perish by exhaustion; but more of them, passing round and round in a circle and in one and the same direction, come to an end by twisting off their heads! Dried specimens of the plant in herbaria exhibit many small coleoptera and the remains of various other small insects, but these have been caught by their feet or mandibles or other parts. Insects too small to be impaled on the barbs are held fast by the viscid secretion of the glands, and likewise perish.

— *ARBUS UNEDO.*—Some gardeners are found expressing the opinion that the Strawberry tree is not fruiting so freely this year as in previous seasons, and opinions are hazarded as to the causes which worked to bring this about. By one section it is attributed to the general infertility of the blossoms of fruit trees in 1879; by another to the cold and wet character of the summer. Perhaps the position of the trees and the character of the soil in which they were growing had something to do with the matter. It has been found in the experience of planters that if the *Arbutus* be planted in a common soil, with a wet and retentive subsoil, it will grow vigorously, and flower, and be in every respect healthy, though it will not bear its fruit until the tree is old; but if the shrub be planted upon a bed of gravel, or upon a sandy bottom and in an elevated situation, so as never to be subject to undue moisture at the roots, the gravel, or sand subsoil, carrying off the superfluous moisture and keeping the roots comparatively dry and warm, it will be found to bring its fruit to maturity when quite young, and by the time the tree attains a tolerable size—in five or six years or thereabouts—it will, in a favourable season, be entirely covered with a profusion of crimson berries, forming an object of great beauty. The effects wrought by the difference between a dry and warm and a cold and wet subsoil will, in all probability, account for what used to be a generally received opinion, that the *Arbutus Unedo*, when young, does not fruit, and that it is only in its older state that the bright coloured fruits attain to maturity.

— *NOTES ON THE VEGETABLE PRODUCTS OF THE ISLAND OF CEBU.*—*Cebu* is described, in a report on the trade and commerce of the place, as the commercial centre for the eastern group of the Visayas Islands, which have a total population of 982,000 souls, 32,473 comprising the population of the town and suburbs, and 417,543 that of the entire island. The island belongs to the Spanish Government, and the principal staple of trade is sugar. Most of the land adjoining the capital suitable for the cultivation of the sugar-cane has been taken up; and as the soil never receives any manure, little increase can be expected in the yield in the island of *Cebu*; but the natives are extending the cultivation of the cane in *Bohol*, and that coast is becoming an important feeder to *Cebu*.

*Manilla Hemp* (*Musa textilis*).—The cultivation of this plant received an impetus during the past year from the high prices ruling from 1869 to 1872, when as much as 11 dols. per picul was at one time paid for *Cebu Hemp*. Many plantations were opened in districts better suited to other crops, and as the stimulus of high prices has since subsided, these have been gradually abandoned. The port is, however, a convenient one as an *entre-pôt* for the Leyte producers of *Hemp*; and the whole

of the production of that island is likely in time to be diverted to this market, instead of part of it going to Manila, as is now the case. It is stated that the plant is proof against the ravages of locusts, but some damage was done to the plantations last year from drought.

*Coffee.*—Patches of Coffee-trees have been planted by the natives in the islands of *Cebu* and *Bohol*, and small parcels of Coffee in the husk are offered for sale in the market, but the quantity procurable is too small to form an article of direct export. The quality of this Coffee is excellent, and the price at the early part of last year ranged from 14 to 16 dols. per picul. Small quantities of an inferior quality of Coffee are also brought from *Yligan* in *Mindanao*, which realised at the time mentioned above from 12 to 13 dols. per picul.

*Tobacco.*—This is a state monopoly, the growers can sell only to Government; and as the natives are not paid in cash but in paper which cannot be collected probably in less than a year after the Tobacco has been delivered, the production has lately fallen off considerably. Unless the Government should alter the mode of payment, the cultivation of leaf Tobacco in the Visayas districts promises to become extinct. These southern islands possess a soil and climate well adapted to the growth of Tobacco, and under a free system of cultivation and export the yield would be very large. If the Government would only leave the Visayas natives free to sell their Tobacco to the highest bidders, the trade would vastly increase, and be lucrative to all concerned in it, while the state might impose a scale of duties on the export of raw and manufactured Tobaccos which would speedily compensate for the loss of the monopoly. The total yield of leaf Tobacco for the *Cebu* district during the past year was 8780 quintals, of the value of 70,000 dols., the whole of which was shipped to the cigar factories of *Cadiz* and *Alicante*.

— ORCHIDS IN FLOWER AT THE FIRS, LAURIE PARK.—A correspondent favours us with the following list of Orchids which are now in flower in the beautiful collection of C. DORMAN, Esq., The Firs, Laurie Park, Sydenham, and which make a splendid show at this dull season of the year:—

<i>Angraecum sesquipedale</i>	<i>Lælia albida</i>
<i>Barkeria elegans</i>	„ <i>anceps</i>
<i>Calanthe Veitchii</i>	„ <i>Barkeri</i>
<i>Coleogyne cristata</i>	„ <i>Davii</i>
<i>Cattleya superba</i>	<i>Lacaste Skinneri</i>
„ <i>Harrisonii</i>	<i>Masdevallia Chimera</i>
„ <i>conchifolia</i>	„ <i>Uelia</i>
„ <i>maxima</i>	„ <i>tovarensis</i>
<i>Cypripedium Boxalli</i>	„ <i>polysticta</i>
„ <i>insigne</i>	<i>Mesaspidium vulcanicum</i>
„ <i>Mandleyi</i>	<i>Odontoglossum granle</i>
„ <i>lanceifolium</i>	„ <i>Inslayi leopardinum</i>
„ <i>Roezlii</i>	„ <i>maculatum</i>
„ <i>Schlimii</i>	„ <i>nebulosum candidum</i>
„ <i>Sedeni</i>	„ <i>paddingum</i>
<i>Dendrobium Ainsworthii</i>	„ <i>pulchellum</i>
„ <i>bigibbum</i>	„ <i>Roezlii</i>
„ <i>chrysanthum</i>	„ <i>roseum</i>
„ <i>formosanum</i>	„ <i>Rossii</i>
„ <i>Goldianum</i>	„ <i>najus</i>
„ <i>heterocarpum</i> , very finely	<i>Oncidium cleiophorum</i>
fl. variegated	<i>Syphonites grandiflora</i>
„ <i>infandibulum</i>	<i>Vanda cœrulea</i>
„ <i>Wardianum</i> , also very	<i>Zygopetalum Mackayi</i>
fine	

The collection is in fine condition, and bids fair to become, for its size, one of the best in cultivation. At present the plants certainly reflect great credit upon Mr. CONINGSBY'S abilities as a cultivator.

— CROTONS AT THE FIRS, LAURIE PARK.—The same correspondent writes:—“In addition to the Orchids Mr. DORMAN has a very fine collection of Crotons, and the plants are superbly coloured. They are not large specimens, averaging from 18 inches to 2½ feet, and as seen here, beautifully arranged, they form one of the prettiest features it has been my pleasure to see. The following are very noticeable and perfectly distinct—there are in all about forty sorts:—The old *angustifolius*, not yet beaten; *aureo-maculatus Disraeli*, Earl of Derby, *Evansianus*, good; *Hawkeri*, *Macarthuri*, *maculatus Katoni*, majesticus, *Mooreanus*, *Mortii*, *nobilis*, *ovalifolius*, *picturatus*, well named; the old *pictus*, still one of the best; *Prince of Wales*, well worthy of the name it bears; *Queen Victoria*, Williams' beautiful hybrid, the best of all the hybrids; *reginæ*, *undulatus*, fine; *Weismanni*, so well known for its beautiful and graceful habit; *lanceifolius*, *mutabilis*, *Chelsoni*, grand; *volutus*, *Andreanus*, *chrysophyllus*, *spiralis*, *Rex*, *rosco-pictus*, *splendidus*, *triumphans*, *albicans*, *Williamsii*, &c. These are splendidly coloured, and any on fond of seeing a good neat collection should pay Mr. DORMAN'S garden a visit.”

— PRODUCE OF MALAGA.—The importation into this country of Muscatel Grapes from Malaga seems to have been effected recently with loss to those who speculated in the packing of this fruit as an experiment. Notwithstanding this, as many as 26,377 barrels were sent from the above port to England during the past year. The result, we are informed, has shown that such parcels as reached their destination in a sound condition have yielded such large profits as to entirely justify risks incurred by the shippers. The Grapes thus sent are packed in cork sawdust in small barrels, containing 46 lb. of fruit. The first cost and expenses on each barrel of Grapes at the port of Malaga is given as follows:—

First cost of 46 lb. of Grapes..	.. ..	42 00
Expenses:—		
Town dues .. ..	.. ..	1 12
Brokerage .. ..	.. ..	1 00
Sorting and marking .. ..	.. ..	4 00
Cost of barrel .. ..	.. ..	0 00
Corkdust .. ..	.. ..	12 00
Cartage and lighterage .. ..	.. ..	1 37
Port dues .. ..	.. ..	0 22
		69 00

—equal to about 14s. 1d. per barrel, free on board. Regarding the suitability of the soil and climate of the country for the introduction of foreign plants of economic value, Consul WILKINSON says, “A more enterprising people than the Andalusians would have availed themselves of the great advantages offered to them by their fine climate and fertile soil to cultivate many a tropical fruit and valuable tree, the produce of which would compensate them for any losses sustained through the failure of their other crops. The following may be mentioned amongst the tropical fruits which grow in the open air, namely, the Custard-apple, Banana, Date, Guava, and in some sheltered spots Pine-apple. With the exception of the Custard-apple and Banana, which although not abundant are common, the other tropical fruits above enumerated are not cultivated, though specimens of each may be seen flourishing in the open air in many a private garden, where also grow several valuable trees, such, for instance, as Mahogany, Rosewood, Cinchona, Mulberry, &c.”

— PINE-APPLES.—About the finest Pines now in the market are those from Madeira, which average from 6 lb. to 8 lb. each. While on the subject of Pines in Covent Garden, it is worth noting that Messrs. GARCIA have just made the first importation of these from Florida—from the neighbourhood of Jacksonville. This is an experimental lot, and the fruits have come to hand in first-class condition. In quality they are very fair, the leaves being somewhat like those of the Smooth Cayenne.

— HORTICULTURAL CLUB.—The annual meeting of this Club will be held at the Club-house, 37, Arundel Street, Strand, on Tuesday next, the 13th inst. After the formal business the members will dine together, under the presidency of Mr. JOHN LEE.

— MR. MARIES' JAPANESE COLLECTIONS.—Mr. MARIES, who has been collecting plants in Japan at the instance of Messrs. VEITCH, proposes to exhibit at the Royal Horticultural Society, at its meeting on Tuesday next, a selection from the numerous curiosities and objects of natural history collected by him in Japan and China. The collections comprise birds, insects, fossils, shells, Japanese books, implements, &c.

— THE WEATHER.—General remarks on the weather during the week ending January 5, 1880, issued by the Meteorological Office:—The weather was very dull, unsettled, squally, and rainy during the first part of the period, but afterwards moderately fine; in some parts of England on the 3d and 4th it was very fine and bright. The temperature was above the mean in all districts—as much as 4° or 5° in excess over the greater part of England and in Ireland, but only 2° in “England, S.” and “Scotland, E.” The wind was generally south-westerly all over the kingdom; strong to a gale in several places until January 2, when it became moderate or light, except in the West of Ireland, and continued so during the remainder of the week. The rainfall was more than the mean in Ireland, Scotland, and in “England, N.W.,” but less than the mean in all other districts. At most stations the bulk of the fall occurred during the first three days.

## Home Correspondence.

**Fruit Culture: Restriction or Extension.**—Discussions as to the relative value of the two methods of producing fruit, viz., by "the restriction" or "the extension" system, may be productive of much instruction; but when one side is entirely in favour of unmodified extension, and the other as entirely in favour of restriction, and can see no good under any circumstances in its opponent's views, much good time may be wasted in reading or paying attention to them. Under certain circumstances there is no room for doubt but that the extension system, reasonably modified, is the right one, while under other circumstances it would be folly to adopt it. Suppose a man hires a house and new garden of moderate dimensions on a seven years' lease, that he is fond of fruit growing, and wants a succession of good Apples, Pears, Plums, &c., all through the seasons at which they are to be had, and prefers growing them to buying them, he may satisfy his desires in this respect by purchasing a quantity of "restricted" pyramids, cordons, or espalier-trained trees; and by continuing to restrict their growth both in root and branch, and by liberally supplying them with suitable food, depend on their producing him a supply of fruit from the first to the last of the seven years, and after the first season or two they will, if he thoroughly understands the management of them, become very "models of fertility." A great number of sorts may, by the restrictive system, be grown on a very small piece of land, and what is also an object to many people, immediate results may be obtained. Some people may object, "But the restrictive system is so unnatural." I maintain that, properly carried out, it is artistic and scientific, and proved by success to be natural also. I go further, and say that, if it were not natural, neither could it be artistic or scientific. An Apple tree entirely in a state of Nature would be a wild Crab, producing fruit of very little use to man. It is natural in man, by all the scientific and artistic means in his power, to improve the fruits Nature has given him, and it is further perfectly natural in him to produce, by artificial and scientific means, various results from improved varieties, in accordance with his wishes. The little restricted pyramids, cordons, or bushes, laden with fruit and in the lustiest health, are a splendid argument against the means used to produce them having been unnatural. It is my humble opinion that the restrictive system may be carried out by natural scientific methods and in highly artistic ways, with the most successful results, far beyond anything yet attempted on a large scale in British gardens. When success is not secured, it is because something in the application of the methods or the conditions of growth is unnatural, and therefore unscientific. People who talk of growing their fruit-trees in a perfectly natural way, seldom, I think, know quite what they mean. Man in a perfectly natural state (*i.e.*, when Nature has had no aid from natural science or art) is a savage, and man under the highest influences of art, science, and religion, is not more above man in a savage state than is an Apple tree on which natural science and art have expended their utmost care above a wild Crab. *J. E. Living, Norwich.*

**Our Rural Population, and its Great Domestic Want.**—In every village we have a church and minister, a school with its teacher and inspector, and the children now are obliged by law to go to school, and not allowed to be employed until they have passed a certain standard or reached a certain age. We also have a sanitary district medical officer and inspector to look after and improve our drainage and drinking water, and to try and keep off if possible all infectious diseases, for sanitary science now-a-days teaches "that prevention is better than cure." But with all these laws and regulations, the poor people in nearly every village are totally unable to procure milk for love or money. People living in towns are much better off, for there a regular supply is sent round night and morning at 2½ per pint, but in the country village and in many places surrounded by large dairies where there are gallons and gallons made daily into butter and cheese, not a drop of milk can be had. This seems strange, but no less true. Go into the cottage, and the morning meal is made of bread and a weak decoction of cheap tea and sugar, instead of cocoa made from the nibs, and plenty of hot boiled milk with either bread or a basin of oatmeal porridge, a health-giving and hearty breakfast. Now the composition of milk includes all the substances which the tissues of the growing child needs for its nutrition, and which is required for the production of animal heat. I saw an account some short time since where a celebrated chemist said, "a pint of good milk contains as much [available] solid animal matter as a full-sized mutton chop." Such being the case, how important and how necessary it becomes that children should have a plentiful supply of milk. Teetotalers are very energetic in proclaiming against drink, but they do

not find a poor man a substitute. All he can now get is some flavoured water highly charged with carbonic acid gas, a very expensive and very indigestible drink. Let a poor man be able to buy his pint of milk for 2d., and be persuaded that it is much better than beer (even if made of pure malt and hops), and thousands would be glad of the chance. Our American cousins are now sending us such a large supply of cheap butter and cheese that the value of our own goods has been greatly depreciated; would it not be a great gain and saving of trouble and expense, and also a great boon and blessing to our poorer neighbours, if some of our producers would sell milk in its pure state? *W. F. Kitchlyffe.*

**Rhododendrons at Pinkhill.**—When passing through the houses at Pinkhill Nurseries the other day I saw some very fine varieties of Rhododendron in bloom. Amongst them I noticed Duchess of Edinburgh and jasminiflorum; the pure white flowers of the latter variety scented all around. It is strange this variety is so seldom met with, as none of all the other varieties are so useful for cut flowers, and none so rich in perfume. A plant that can be had in bloom at this season of the year having so many qualities as Rhododendron jasminiflorum is worth possessing, and should be in every conservatory. *L. Dow, Saughton Hall, near Edinburgh.*

**The Origin of the Clanbrassil Fir.**—"A Lover of Trees" has sent us one of those curious tufts of densely crowded branches which occur now and again on the Spruce Fir, as shown in the figure (11). They are quite different from the Witches' brooms of the Germans, which are the result of fungus growth. In Switzerland some few years since we had reason to think that those growths were perpetuated from seed, at least young plants may be seen on the ground as well as on the boughs. The Clanbrassilian

FIG. 11.—TUFTED BRANCHES OF FIRS.

and other dwarf varieties of Firs have apparently originated from these forms. *EDS.*

**Cleaning Stove Plants.**—At this dull season, when work in the garden is not quite so pressing as at other times, a few practical remarks on the cleaning of stove and greenhouse plants may not be out of place. For the last few years it has been my lot to take charge of collections of plants that have had mealy-bug, scale, &c., upon them, and I have tried various insecticides, but with no success until I tried a mixture made as follows:—Paraffin oil, two wineglassfuls; soft soap, ½ lb.; and common shag tobacco, 2 oz. The tobacco I put into a jar and pour a quart of boiling water over it, covering it tightly down until it becomes cold, and then the strength is drawn out of it. I then take a small galvanised iron pail, put the ½ lb. of soft soap into it, and add the paraffin oil, beating the same up with a flat stick until it becomes a paste; then put with it the tobacco-juice, and add one gallon of boiling water. When cold it is ready for use. When about to clean the plants we put one wineglassful of the mixture into a pan, and add about a quart or so of lukewarm water, then proceed to sponge the plants. With stove plants and Camellias I find it exceedingly useful; in fact, I use the mixture every time I have my plants washed, and thereby have no further trouble with insects of any sort. And now that Azaleas, Cytisus, Bouvardias, Cyclamen, Eucharis, and plants of a like nature are being introduced into the forcing-house it will be found useful to syringe the plants so introduced at least once a-day with a solution of the mixture, putting a wineglassful into a 4-gallon can, and keeping the same well stirred with the syringe while using it. It will not hurt the most delicate foliage plant. *A. B.*

**The Champion Potato: a Farmer's Lesson.**—Some of Mr. Culverwell's statements at p. 694 of your last volume are not quite correct (though I am sure not intentionally so), and might tend to lead some of your readers into error if not corrected. The rows were 40 inches

apart, which, I think, was quite far enough, and not 4 feet as stated by Mr. Culverwell; the price of the land was £10 10s. per acre, the Potatoes to be hoed and cleaned to my satisfaction; the rest of the particulars, as to manure, &c., are about correct. I am glad to say that the Potatoes were a good crop, but not so good as Mr. Culverwell thinks. I tried the crop carefully before it was lifted, and considered there would be a little over 7 tons per acre; but now, as they are all out of the ground, I have measured them and find I have over-estimated them. About 6 tons will be nearer the mark, which will leave a nice profit to the planter if sold at £6 per ton, the top price here at present for them. I think he deserves a fair profit after spending at least £20 per acre for only one crop. I may say that I have been interested in Potato growing for over twenty years, but I have not learnt the lesson by this one transaction to grow all Champion Potatoes in future, as it is only in such seasons as the last and 1877, that was almost fatal in some districts to the Regent, that the Champions will come to the front. Last year, when the top qualities of Regents about here were only worth about £4 4s. per ton, the Champions could be bought for £3 per ton; any one looking at the quotations of the London Potato markets last year about this time you will find the Champions quoted at from £1 to £1 10s. per ton less than Regents. Though the Champion this year is not a bad table Potato it is very much inferior to the Regent, which has kept sound and good about here this year, though a light crop. Mr. Culverwell asks where the farmers can find a better friend than the land they cultivate if they treat it liberally and fairly. No doubt it is a good friend in good seasons, but I am sure a great many farmers will say they could have found a better last year had they known what sort of weather they would have had to contend with, and which has brought ruin to many a hardworking and careful man. *James Greaves, Snape Castle, Bedale, Yorkshire.*

**The Late Frost.**—It is too early in the year to speak confidently of the saved, but unfortunately some of the lost are too distinctly visible, as one makes a tour of the beds—a somewhat melancholy operation, though the air is bland this New Year's Day. First of all, the old *Stauntonia latifolia* is killed to the ground, so is the Myrtle-leaved Sumach. *Rhus glabra laciniata* seems all right. *Erica codonodes* and *mediterranea* are both gone; *Muhlenbeckia complexa* severely punished, as also *Mesembryanthemum uncinatum* and *Margyricarpus setosus* on the rockeries. The beautiful *Selaginella helvetica vera* seems quite fresh, and many other alpine treasures; but a lovely old solitary Rose, *Blairii* No. 2, on the lawn, will never bloom again. The exquisite Tea, *Marie van Houtte*, called "Lemon Ice" by the master of the house, is dead; it had three buds when the frost seized it, so the sap was high. *Catherine Mermet*, another lovely Tea, looks well as yet, and all the beds of Roses on their own roots look happy. That pearl of shrubs, *Olearia Haastii*, is lusty and green, evidently very hardy. *Azara microphylla* is rather brown; the *Escalarias* are dreadfully punished, also three *Ceanothus* trees, the worst being the oldest in age, *C. azureus*; *Brieglesia spicata* is injured. The Rhododendrons look comfortable, and are well budded. The *Tritomas* are suffering; *Libertia ixioides* stands well. With regard to the common things, Lavender, Rosemary, and Lavender-cotton are better than last year, and so is the Golden Thyme. All the double Wallflowers are dead with one exception—the early *Belvoir Dwarf Yellow* is quite fresh. The evergreen *Magnolias* are flourishing, but the Sweet Bay and *Laurustinus* are wretched. *Cistus laurifolius* is very hardy, but the Gum *Cistus* is not; *C. formosus* has been nearly killed, and *Jasmines humilis* and *fruticans* also. The sweet *Cornilla Emerus* is well, but *Eugenia Ugni* is all but dead. The lovely variegated Olive looks deplorable, and many of the *Euonymus* would have been dead had not the smaller plants been lifted: *E. Duc d'Anjou* and *E. radicans picta* are especially tender. The large bushes of *Euonymus* are perfect martyrs to this arctic regime. Though the frost here was not so severe as in our Lincolnshire garden, where 36 were marked, and here only 29, there all the *Laurustinus* are killed, and even the *Acubas* nearly so. The most tender Ivy in a collection of eighty-seven sorts is *Hedera canescens*; it is dead, a pretty hoary plant. *H. himalaica*, also grey, and delicately cut, stood well on a west wall. *Van Houtte's purple Daphne* is very robust, and its bronze rosettes are effective in the foliage beds. *Cineraria acanthifolia* is beautifully hardy in a most exposed bed facing north. The charming *Hypericum proliferum* and *oblongifolium* are well; *H. nepalensis*, the most lovely of all, perished last season. The *Camellias* and *Cyclamens* have done very badly in the houses, but the little alpine Sowbread never fails, both pink and white, spring and fall. There are still some autumn Crocuses struggling into existence

to cheer the heart and please the eye of garden-loving people; and, to crown all, we have finished planting the bulbs to-day for the spring garden. The old tufts of Christmas Rose are crowded with bulbs, and we have already picked some of the lovely roseate-tinted cups of *Helleborus niger maximus* (*altifolius*), the most engaging of winter flowers; and, finally, the Ivies, great and small, green, golden, silver, and arborescent, are in perfect health. *Hedera dentata* is a grand plant, quite tropical in its effect, suits in any situation, and is never discoloured by the most intense frost. *H. M. E., Midland Counties.*

**Poisonous Plant.**—Another plant from which farmers often suffer, is the *Solanum Dulcamara*, which in some districts grows very freely in hedgerows, where sheep are fond of browsing, and these after eating the berries soon pine away and die. A friend of mine lost eight of his flock in a few days, and only saved the others by removing them from the field till the plants were grubbed up and destroyed. *S. nigrum* is even more deadly than *S. Dulcamara*, but fortunately is less common. *J. S.* [Can this be authenticated? *Ets.*]

**Lælia anceps alba.**—Having noticed in several of your numbers that Mr. W. Bull, of Chelsea, first bloomed this beautiful variety of *anceps*, I beg to say that it was in bloom with me just twelve months ago, which I think was before it bloomed at Chelsea. I shall have it in bloom again in the course of a week or ten days, when I will forward you a bloom by post. *James Hill, Gr. to Geo. Hardy, Esq., Pickering Lodge, Timperley, Cheshire.* [Mr. Bull's plant was recorded by us as being in bloom in our number for Dec. 14, 1878, p. 756. *Ets.*]

**Influence of the Stock upon the Scion.**—I herewith forward some Pears and a sample of Horse Radish,

FIG. 12.—ASTON TOWN

sibly be due to their mixed ancestry, but, in the present instance, not only is the outward form intermediate, but the form of the core and of the seeds. The speckling of the graft was like that peculiar to Aston Town, but less in amount. There is still another possible cause of the variation, and that is that the pollen from the flowers of the stock were transmitted to those of the scion, and so produced a hybrid production. Such cases are asserted to have happened, but we think such a supposition much more improbable than that of graft hybridisation. *Ets.*]

— Much has been written upon the subject of what stocks are the best for certain sorts of fruit, but I should like to know if any one has noticed whether any varieties of fruits or flowers grafted or budded upon wild stocks of any sort have thereby been deteriorated? We often hear that the Golden Pippin Apple and others are not so good as they were, and in my opinion, looking at the subject from a physiological standpoint, the blending of the superior with the inferior must tend to deteriorate the former; and if this is so it is evident that we should endeavour to get the superior varieties of fruits on their own roots. We see in the case of Roses that the first year or so the flowers are best, and many growers are getting them on their own roots. It also becomes a question if we do not retard progress by raising seedlings from grafted plants, as the progeny must have more or less of the wild sap in

FIG. 13.—BEURRÉ CLAIRGEAU.

FIG. 14.—GRAFT HYBRID

for the meeting of the Scottish Horticultural Association on December 2. I send the Pears as an illustration of the possibility of the stock altering the character of the fruit. I must own that I have hitherto been sceptical on the point, but the members can see and judge for themselves of the great difference produced in the fruit by the specimens I send for examination. A tree of Aston Town Pear, which seldom produced any fruit, was headed back some years ago, and grafted with *Beurré Clairgeau* Pear. This year some of the old spurs left on the Aston Town stock bore fruit, of which fig. 12 is a sample. The sample fig. 13 is fruit of *Beurré Clairgeau*, produced by a pyramid tree from which the grafts were taken for working upon the Aston Town. No. 3 (fig. 14) is the produce of these grafts—*Beurré Clairgeau* worked upon the tree which produced No. 1 fruit, Aston Town. The fruit is rather smaller than usual with us in Cheshire, owing to the bad season. I would have kept them till they were ripe, so that their quality might be judged of at the meeting, but I am afraid they will not keep sound till the next meeting in January. However, the members will be able to see and discuss the great change produced in the character of the fruit of No. 3, by being grafted upon a particular stock. [The above note, by Mr. William Burns, Thingwall Hall, Birkenhead, was read at one of the recent meetings of the Scottish Horticultural Association. The illustrative specimens were obligingly forwarded to us, and, as will be seen from our drawings (figs. 12, 13, 14), they are singularly interesting. The graft, No. 3, is curiously intermediate in form and size between Aston Town and *Beurré Clairgeau*. If the variations had been in external characters only we might have attributed them simply to that innate tendency to vary which all plants possess more or less, and which may pos-

them. The results of observations on this point made by others would be interesting. *J. Croucher.*

**Slaughter of the Apricots.**—Herewith I send you a portion of a dying branch of an Apricot, which upon examination you will find pretty well filled with grubs in various stages of development, the said grubs being—in my opinion, at least—the primary cause of death in the branch referred to. *Herfordian.*

**Daphne Mezereum and other Wild Plants in North Lancashire.**—Near Grange-over-Sand, which is on mountain limestone at the head of Morecambe Bay, *Daphne Mezereum* is common in the rocky woods, far from gardens or ornamental walks, and I think is undoubtedly indigenous. The cottagers dig it up freely for their gardens. *Daphne laureola* is common in the same woods. *Aquilegia vulgaris* (Columbine) is of general occurrence throughout the district, growing in wild lanes and out-of-the-way places in which it would be difficult to account for its introduction, if not native. Two other plants of more general distribution are very conspicuous from their great abundance here, occurring from the very top of the limestone hills, 700 feet high quite to the sea level—*Verbascum Thapsus* (Great Mullein) and *Inula Conyza* (Ploughman's Spikenard). These biennials take the place of Foxgloves, which are found rather

sparingly on the limestone. I also observe fine clumps of *Atropa Belladonna* (Deadly Nightshade) growing out of the limestone rock close to high-water mark. All these plants I have seen, and I am also told by more than one trustworthy authority that *Ophrys apifera* is often found here, associated with *Ophrys nuseifera*, though less common. In Sowerby's *English Botany* we are told that *O. apifera* does not occur on the western side of the island farther north than Tenby. *C. W. Dot, Grange-over-Sand, Jan. 5.*

**Market Prices of Vegetables.**—There is one phase of this subject that, if explained, may perhaps tend to throw some light upon the cause of such unsatisfactory returns from market salesmen as are now and then complained of, and which are too apt to lead the reader to imagine that these said salesmen are but a voracious set of vultures preying upon the poor grower and on the public. On the west side of London there are a very large number of market growers who do not, as a rule, take their produce to market, but dispose of it at the greengrocers' shops through the immense western suburbs, thus coming more immediately into contact with the consumer than is the case when a salesman is the go-between. These growers are unanimous in the opinion that the present winter has been one of the worst ever known to effect profitable sales; the shopkeepers, who are the best barometers of the rise and fall of the wages income, all declare that there is no money about; that their best purchasers in times of labour and prosperity are the working classes, who are ready-money customers, and that the general depression has told so heavily upon these that they have little spare money wherewith to purchase garden products. It is

therefore evident that if the dealers cannot afford to pay remunerative prices to the growers direct, they nor their fellows can better afford to do so through market salesmen. Depend upon it whenever trade and commerce shall so improve as to make labour abundant, and the purchasing power of the masses perhaps double what it now is, we shall hear few complaints as to low prices, for the wants of the metropolitan community are enormous. *A.*

**Picea lasiocarpa (Lowiana).**—I notice that in the *Gardeners' Chronicle* of Saturday last you say that the *Picea Lowiana* had not yet fruited in this country. I had a few cones, about three or four, on the top circle of branches of a lately moved plant of what I had from Mr. Low as *P. Lowiana*. I intended to have sent you a cone, but unfortunately I find that they have all broken up and fallen to the ground. However, to show that there were cones I have sent a small box with a few of the seeds, a lot of the scales, and a core of what was the cone. I also send a branch of the tree on which the cones grew, and a branch of what I have for *P. grandis*. They seem to me to be perfectly distinct; what do you say to them? *J. B. Mackay, Totteridge, Herts.* [We thank you, and will give you the benefit of our opinion after we have had time to study your specimens. *Ets.*]

**The Late Frost.**—I fear the late severe weather has finished off some things that just escaped 1878 and the spring of 1879. I see that *Magnolia grandiflora ferruginea*, which is generally the hardiest of the two, has suffered very much this winter. On looking over some few things concerning last season there were several (to me) strange occurrences as to the way in which the frost affected the same genera and species

under different circumstances. *Cistus laurifolius*, planted on a small island with about 30 feet of water all round, and which last season was frozen over under 22° of frost, has escaped unhurt and looks well at the present time; yet of other plants of the same species planted by a south wall several died. I judge from this that there is too great a change in that situation between the day and night temperature, while that of the island was much more regular up to the time the frost broke up altogether. I give you below the names of a few things that have been killed or injured, and a list of some among the plants whose hardiness is generally considered doubtful but which have escaped:—

<i>Killed.</i>	
<i>Jasminum azoricum</i> <i>Solanum jasminoides</i> <i>Olea europæa</i>	<i>Cistus corchoriensis</i> " <i>cordatus</i> " <i>sagittifolius</i>
<i>Injured.</i>	
<i>Myrtles</i> , cut down <i>Ceanothus</i> sp., points killed <i>Leptospermum virgatum</i> <i>Gynerium</i> , nearly killed <i>Kniphofia</i> <i>Eschscholtzia polystachya</i> <i>Edwardsia microphylla</i> , points killed <i>Aloysia citrodora</i>	<i>Rosa bracteata</i> <i>Rubus rosafolius</i> , tops cut <i>Libertia formosa</i> <i>Calycanthus macrophyllus</i> <i>Garrya elliptica</i> <i>Azara microphylla</i> <i>Phormium tenax</i> , partly sheltered, flowered in summer

The late growths of common Laurels and Portugal were very much injured.

<i>Not Injured.</i>	
<i>Berberidopsis corallina</i> <i>Lardizabala biternata</i> <i>Bignonia capreolata</i> <i>Escallonia macrantha</i> and others <i>Gunnera manicata</i> , a few dead leaves <i>Fuchsia procumbens</i>	<i>Oleia Haastii</i> , hardy as anything <i>Veronica pinguifolia</i> <i>Rubus deliciosus</i> <i>Camellias</i> <i>Daphne collina</i> <i>Hymenanthera crassifolia</i> <i>Canna Achiras</i>

Charles Green, Pendell Court, Bletchingley.

**Potatos.**—Referring to the letter of "Solanum" in your last week's paper, I shall be glad if you will allow me to say, that it was not merely with my consent, but by preference, that in sending out the Woodstock Kidney to the public through the Messrs. Sutton, their name was attached to it rather than my own. I had, of course, no facilities for the distribution of my Potato such as are possessed by those gentlemen, and I have had no reason to regret having put it into their hands. My name is quite sufficiently well known to my friends in connection with my seedlings, and I considered it important to entrust my seedlings to a firm from whom the public would certainly be able to obtain a supply, not only in the first but in all subsequent years, of the true stock raised by me. It is curious that it takes about two years after a novelty is sent out for it to reappear in your advertising columns under other auspices, and bearing the names of other firms, with or without the word "improved." Two years may be enough time after having been purchased from the raiser to get up a stock of the original thing, but it certainly is not sufficient time for others to create any improvement, sufficient for commercial purposes, upon the original stock. *Robert Fenn, Cottage Farm, Sulhamstead Abbots, Jan. 5.*

—In justice to Messrs. Sutton & Sons I wish to state that I sold them the entire stock of my Potato, with the clear understanding that the purchase included the right to call it whatever they liked. Of course having parted with the whole stock to those gentlemen, I never wished or expected my name to be used, and they did quite right in sending it out to the public as Sutton's Magnum Bonum. Messrs. Sutton having allowed me to keep the produce of some small "chats" left in the ground, which came up in my field the following year, these greatly increased during the next two years; and finding the Messrs. Sutton had by that time as many of their own growth as they required, I sold some to my neighbours and others, including a London seed merchant. I soon found, however, by the gardening papers, that the London firm in question were calling the Potato by their name, which, of course, they had no right to do, as I sold that right to Messrs. Sutton. Whether their adding the word "improved" saves them from getting themselves into trouble I do not know, but I thought it only fair to myself and Messrs. Sutton that the facts should be told by myself. *James Clark, Christchurch, Hants.*

—Your correspondent "Solanum" appears to be unaware of the fact that we purchased a portion of the original stock of Magnum Bonum Potato from the raiser, Mr. Clark, and offered them in our catalogues as far back as the year 1877. At that time we sent a portion of the original stock of Potatos to one of the best and most reliable gardeners in the country, and after a selection by that gardener, we received back the "improved" stock of Magnum Bonum Potato, to which our name has ever since been attached. We hardly know that we are called upon as a well-known house of business to defend ourselves against an anonymous correspondent, but we think that in justice to the public we ought to make a few remarks. As regards great seed firms and their practices, if "Solanum" had any practical knowledge

of the production of seeds, he would be aware that original types rapidly deteriorate in character during the process of ordinary cultivation, but some of the great seed houses who wish to keep their stocks pure and distinct use extraordinary efforts to attain for their seeds a high standard of excellence, and in order to do this they are compelled very often to remove a large portion of plants from the seed crops, whenever any are found showing the slightest tendency to deteriorate in quality, and when, on the other hand, they observe occasional plants in every way superior to the crop in general, the produce of these superior plants is carefully harvested by itself, and grown again and again, and if the superiority is of a fixed character an improved variety has been secured. This has probably escaped "Solanum's" attention, or perhaps he is imperfectly acquainted with the subject, therefore it is prudent for a careful producer to offer these select stocks as being of greater value than the originals: this is reasonable and truthful. It would be perhaps justifiable in some instances to rename the selected variety, but this course would be more confusing to the trade, and pernicious to the public if adopted; and any one who attempts to check the use of the word "improved," as applied to superior vegetable productions, is striking a blow at the purity of stocks: for what seedsman would care to take the trouble, and bear the great addition to the expense of production, if he did not get one of two things, either extra profit or enlarged reputation? It will be found on reference to the catalogues that some houses make no extra charge for these improved varieties, relying for recompense upon an increase of renown for their house, so that "Solanum's" imputation, that the British public have to pay for such improvement, is hardly justified. We should have almost thought that the necessity for careful production of vegetables and flowers for seed purposes was so well known to the professional gardeners and amateurs that the remarks of "Solanum" would have been unnecessary. We trust, however, that in any future communication "Solanum" will have the courage to sign his real name, otherwise the purport of his letter might be reasonably subject to what "Solanum" would consider uncharitable criticism. We have perhaps a greater right to call things "improved" than most houses, as it is a well known fact that our seed farms are larger than any in England, and it is also a well-known fact that we are always selecting and re-selecting stocks. *James Carter & Co.* [Would not the word "selected" be preferable to "improved," as not liable to mislead? Eds.]

**Pears that Have Done Well.**—In a previous number I named some Pears that had failed here, I now turn to a more pleasing view of the subject and specify kinds without which our supply for the dessert and kitchen would have presented a great falling off. *Jargonelle*, on a north wall, carried a good crop, fruit not quite so large as usual but tolerably well up in flavour; *Comte de Lamy*, a standard fruit, quite equal to other years in size, was a month later than usual in ripening and supplied the table until December: with us this is the highest flavoured of autumn Pears, colours beautifully and is worthy of a place in every collection; *Marie Louise*, on walls and standards a fair crop, had to thin the wall tree; ripened and finished well, not fit for table until the beginning of this month; will keep up the supply to the end of the year. *Doyenné du Comice* not quite so large as in other years, but nearly up in quality; *Duchesse d'Angoulême* on wall had a fair crop, but fruit not so regular in size as usual, a few at the extremities of the branches are large and well finished—makes a fine dish on the dinner table, and this season will be fit for use up to the end of January; *Beurré Clairgeau*, standard, good crop and showy Pear, not quite so large as last year, will not be fit for use this month; *Catillac*, on wall, carried a good crop of average-sized fruit; *Uvedale's St. Germain*, grown on wall, heavy crop, had to be well thinned, fruit not quite so large as usual, but well coloured, sound and good. The two last are kitchen Pears, which keep up the supply until the beginning of June. *T. Blair.*

**Decorative Gardening at Kew.**—I have often seen the opinion expressed editorially in the *Gardeners' Chronicle*, that, so far as the reasonable demands of the general public will permit, the purely decorative phase of gardening should be subordinated at Kew to the development of horticulture of an educational or scientific character; and with that opinion I entirely agree. At the same time I think it most unwise on the part of the Kew authorities, while they profess to devote some portions of the establishment to the decorative element, to allow that portion—which is little enough, goodness knows—to be so much neglected as it appears to be at the present time. I never remember to have seen the show-house—popularly known as No. 4—look so mean as it did a few days ago, when the side stages were decorated (?) with third-rate Primulas, a few

miserable Hyacinths, here and there a leggy *Cineraria*, a couple of lean *Bouvardias*, *Chrysanthemums* all legs and pots, their flowers passing into the decomposition stage; starved and weakly little Heaths, a few ancient *Solanums*, and Zonal *Pelargoniums* that would drive Mr. Cannell crazy. Not a *Cyclamen*, a *Carnation*, a *Tulip*, or a *Violet*, not even a spray of *Lily of the Valley* to be seen in the first week of January, 1880, in the one show-house maintained in Kew Gardens. There was, however, one plant in flower that pleased me much—a pretty *Strobilanthus*, and that, which is by no means so common as it deserves to be, was unnamed. Disappointed with No. 4 I went to the Orchid-houses, and in the great national garden, that we are all so proud of, there was not a solitary *Calanthe* to gladden one's vision. My old friend *Ansellia africana* was there in good form, but not a single *Calanthe*! Can the reason of their absence be that they cannot grow these splendid flowers at Kew? I am loth to believe that. Of the science put on paper at Kew the general public knows nothing, and, worse luck, cares less; but as regards the art of cultivation, I do think that those who pay for it have an undoubted right to demand that it should be, as far as it goes, at least no worse than the general average attained at other places; at present, as exemplified by the contents of No. 4, it is sadly below par. *Townsmen.*

**Soil Temperature.**—In the last week the changes have been very striking. Up to December 29 the earth thermometer at my station here, 1 foot below the surface, had ranged between 32° and 33° from Dec. 7 to Dec. 29. Since then it has risen daily until up to 41°. On January 2. The thermometer at 2 feet below the surface stood between 36° and 37° from Dec. 7 to Dec. 16: from that date to the 18th was for the most part between 35° and 36°, then rose gradually to 37° on the 31st, and now stands at 40°.6. It seems to me very interesting in connection with plant growth. *O.*

**Horticultural Boilers and Heating.**—I sympathise with Messrs. Weeks in one very cogent observation adduced by them, viz., that their work in many cases has been brought into bad repute by so-called engineers, who, divested of their hardihood, are either plumbers, blacksmiths, or gasfitters, sometimes better and sometimes worse, but seldom capable of undertaking the duties of a competent engineer. A person should at least understand the rudimentary principles of heating before he dubs himself with the title of "engineer." There can be no doubt that the Messrs. Weeks execute their work thoroughly; indeed, their houses are models of what horticultural buildings should be, and where the glass is arranged in "blocks" according to modern ideas, their boilers are powerful, and there need be no fear of them doing their work. Mark! I say nothing about "consumption of fuel." According to lawyers, however, there are always two sides to a case, and upon the other side I agree in the main with Mr. Baines. Messrs. Weeks' boilers are public property, and there is nothing wrong in criticising their merits; moreover, it is claimed for them that they are the best boilers extant. The point I should like to see discussed is the respective "principles" upon which the upright tubular and saddle boilers are made. If the principle of the upright tubular is wrong there is an end of the case, and *vice versa*. Gardeners, as a rule, are a matter-of-fact body of men, and it is hard to knock out of them what they have observed in practice and acquired by hard work. When I used to stoke in my younger days, I was sometimes severely cautioned when charging a saddle boiler for putting a lot of fuel in such a way that the whole mass burned away together. It was understood by us juveniles in those days that in order to be economical the body of fuel should burn steadily from the back of the boiler to the furnace-door, and if this be correct it cannot be done with the tubular, for self-evident reasons. There cannot be two opinions as to their great consumption of fuel. Within the last few years I have had several opportunities of choosing any form of boiler that I liked to heat several ranges of houses, and I have invariably chosen the common saddle boiler with waterway back, or the terminal-end saddle. It is supposed or rather asserted that night stoking can only be abolished by having those tubular boilers. This is a fallacy which has gone abroad, because many people are tempted through a kind of mistaken economy and sometimes under the advice of those whose interest it is that the work should be done "some way," to have small boilers and insufficient heating surface which necessarily keeps the stoker continually busy and entails more cost in a very short time, besides not being so good for plants than if a good-sized boiler and plenty of piping were put in at first. I had a practical illustration not long ago, near to where I then lived, in arranging the heating of two ranges of houses for Gilbert Winter Moss, Esq., of The Beach, Aigburth, near Liverpool. The architect (not being a horticultural one) had no say in the heating, and I determined when my advice was taken not only to put in

an ample quantity of piping according to the temperature that was required to be kept in each house, but also to see that the boilers were large enough for all future anticipations: the result being that the stoker could go comfortably to bed all last winter at 10 o'clock without doubting the capacity of the apparatus to keep the different houses at the requisite temperatures until 7 o'clock the following morning. The mischief of large boilers (and I do not name the tubular more than any other kind) is most felt in places where the glass is scattered, and the houses that require the highest temperature are not so arranged as to be nearest the boiler. The loss of heat in "the mains" must be great (especially if they are not laid within the houses where it could be utilised), in fact a waste of heat before it reaches the point where it is most required. Mr. Baines was also undoubtedly correct when he stated that in such places two or three saddle boilers would be much more useful and economical than a couple of tubulars or a couple of any other kind that any one else can mention. *W. Hinds.*

I have read most of the letters on this subject which have appeared in the *Gardeners' Chronicle*, and I am sorry to say with very little advantage, for they amount to a mere squabble of words without communicating any useful information. Comparisons are made between tubular and saddle boilers without any proper basis. Even in the paragraph which appears in your last volume, p. 822, it is stated, "the tubular boilers in the Palmhouse at Kew, of which we gave an illustration in November, 1877, are giving great satisfaction—giving a proportionately larger amount of heat for the same quantity of fuel than the flued saddle in the temperate-house." No fellow can understand this. The fuel is equal, but the other member of the proportion is wanting. The only other letter I shall refer to is that quoted on p. 760, and to which you seem to attach some importance, where the writer says that "It is not so much the shape of the boiler as the position in which it is set, the work it has to do, and chiefly the manner in which it is stoked." With this I cannot agree, for I think the shape of the boiler is most important, the work it has to do is comparative to its efficiency. I look at the question in this way. 1st. A hundred-weight of fuel gives out a certain amount of heat when consumed in the most perfect manner. How is this heat best utilised for heating our hothouses? It cannot be used direct, and therefore one must have some means of rapidly absorbing it, and conveying it to where it is wanted. 2d. The most convenient means of absorption is a boiler, and therefore the boiler which is so formed as to absorb the greatest amount of heat developed from the fuel must be the best. Now, looking at the advertisement on p. 672 of November 22 last, I cannot conceive that the tubular boiler there shown can be the best, either for generating the heat or for absorbing it. I had one of Weeks' boilers some ten years ago; it cost a good deal, and a good deal more for setting. It worked a short time, when the bottom ring split. I had to pull the brickwork to pieces to get a patch put on—no easy job for the mechanic. It gave way again in a storm. I then determined to make an end of it. I telegraphed to Russell & Co., Glasgow, and got an upright malleable iron boiler from them, which required no brickwork, and I had it at work again within forty-eight hours. I have not had the least trouble since. On breaking up the Weeks' boiler I found the tubes coated on the outside with about half an inch of hard soot, which, being a non-conductor, must have caused a great loss of heat. My present boiler is certainly not the best form, but I was obliged to take it to save my stove plants and vineries. I intend to alter it next summer, and hope to save much fuel. As it is impossible to compare two boilers doing different work, I would suggest that the makers of saddle, tubular, and other boilers, should have a competitive trial, each putting up a boiler capable of heating, according to their statements, say 5000 feet of 4-inch pipe, up to 100° or some agreed temperature. Let these boilers be unconnected with any pipes, but open to the atmosphere, so that the steam generated can escape rapidly. Each must have a tank containing a certain quantity of water, with a tap to allow the water to enter the boiler, so as to keep a constant level in it; give them a certain quantity of fuel to start with, keep the boilers going for ten hours, then weigh the fuel remaining, and measure the water evaporated. In this way will be ascertained the quantity of water evaporated per pound of coal, and prove which is the best boiler. There is no other way of doing it. The work done is the heat absorbed through the boiler by the water evaporated, and this is equivalent to a certain number of feet of pipe kept hot in a temperature of so many degrees. No two houses are alike, and therefore the heat of 1000 feet of pipe in a Palmhouse cannot be compared with 1000 feet in another house. Unless some such experiment is agreed on and made, the squabble may go on; but "facts" which are mere assertions are not "proofs," or proved by other assertions which are not true. No mere inspection of a boiler at Bull's or Cowes, even by H.R.H. this or Sir William that, will prove anything as to work

done, which is what we are all most anxious to ascertain. *K. S. Newall, Ferntree, Gt. Sheff., December 27.*

—This subject, which has occupied so much of the *Gardeners' Chronicle* of late, is a most difficult one, and it is doubtful if any good results will be derived from such a discussion unless some plan, as suggested by your correspondent, Mr. Bramham, at p. 768, could be successfully carried out, for there are but few gardeners who have not a fancy for a particular boiler, either from their own experience or because it has been strongly recommended by a friend, and all the writing imaginable would not convince them that they had not the best boiler out, unless you could prove by some undisputed fact to the contrary. During the last thirty years I have had experience in the working of at least a dozen different boilers, including both cast and wrought iron saddle boilers, and my idea for a long time was that there was nothing equal to the saddle boiler, and I should have held very strong arguments in its favour. In 1873 we had one of Weeks' No. 4A patent duplex compensation boilers fixed here, to heat the following range, viz., two greenhouses, two plant stoves, three vineries, Fig-house, Peach-house, Mushroom-house, potting-shed, a room for keeping Grapes in bottles, and my office. Since the above date my views have quite changed as regards the saddle boiler where you have a large quantity of piping to heat by one boiler; and I am prepared to say, when you have several thousand feet of 4-inch pipes to heat there is no boiler that has come under my notice that has given me such satisfaction as Weeks' duplex compensation. It is rapid in circulation, easily managed, and consumes a remarkably small quantity of fuel for the amount of piping it has to heat. *I. Dell, Stoke Rochford.*

—During the present discussion on this subject, there has not appeared anything from the stokers. Surely, if some of them would speak their minds, they would help to solve this difficult problem, for it depends principally on the stoker's attention and intelligence whether a boiler does its work efficiently or not; and, as one of your correspondents has very forcibly remarked, "the best fuel economiser is a good stoker." With your permission I will relate my experience during my term of probation as an assistant gardener; but let it be distinctly understood that I have no interest in recommending one boiler more than another, as I am not in any way connected with the trade, and am quite unknown to all the large firms of hot-water engineers, &c. I can therefore give a strictly unbiassed opinion, as far as my experience goes; but, first of all, I will just enumerate the various kinds of boilers I have had to work. They are the old form of wrought-iron saddle, the flued saddle, the terminal saddle, the corrugated saddle, the saddle used by the Cowan Company for their limekiln apparatus, the conical boiler, the upright cylinder, Hurd's tubular, Thompson's tubular, the old form of Weeks' tubular, and Weeks' tubular with patent diaphragm, &c.—amounting in all to thirty-three apparatus, in various parts of the kingdom; and I unhesitatingly say that, for quickness in getting up a good heat, smallest quantity of fuel required according to the work done, minimum amount of labour required in stoking, length of time they can be left without attention in any way, general efficiency and trustworthiness, I have found none that will bear any comparison with Messrs. Weeks' patent as fixed by them at present. Of their durability I am not able to give an opinion for any length of time, but I can say I have never known a tubular boiler to fail except Thompson's, which gave way through the melting of a lead pipe which had been fixed to the boiler to clean it out by—a fault which was easily remedied, and which would never have existed had the boiler been properly erected in the first place. I could mention one tubular boiler which had been at work to heat a mansion for upwards of forty years. As regards the saddles, I have a lively recollection of one which had been put in to heat a Pine-stove, &c., giving way in a severe frost through a bad crack, which had to be replaced at once by a new one, causing no end of trouble to all concerned; and several others have cracked in a less degree, and had to be repaired. I have never heard of a tubular causing any bother in this way. As regards the quality of fuel, tubulars certainly require the best coke that can be got, in order to do their work thoroughly; so also do saddles, and they burn a greater quantity in proportion than the improved tubulars. I am strongly in favour of a mixture of coke and coal for both classes of boilers. A much greater heat will be got if a small quantity of the latter is added. *W. H. Divers, Burghley.*

—Throughout this correspondence we feel that we have rebutted by the best possible testimony, namely, that of facts and figures, every statement made by Mr. Baines, until nothing is now left to reply to but the promised "long list" of failures, which we presume Mr. Baines has done his best to produce. In this endeavour he, as we knew he must, has signally failed simply because the much-talked-of failures never had any existence; and we feel perfectly

justified in repeating, that this as well as many others of his statements was reckless and consequently unfair and misleading, and as to the four cases he has somewhat insinuatingly mentioned they can be easily disposed of. In the first place the boilers discarded by Messrs. Veitch were not of our design, manufacture or fixing, but were of a totally different construction; and as every unbiassed person knows there are tubulars and tubulars. As to those at Manley Hall we never had a duplex boiler either fail, crack or go wrong in any respect. The simple facts are, two of our duplex boilers worked part of that establishment for five years with great success, and were only removed when the establishment was unfortunately broken up, and the collection of plants, hothouses, boilers, and pipes sold. That these boilers were in good condition and sound at that time, after five years' wear and tear, we can furnish the most clear testimony. As to the boiler at the Messrs. Henderson's, Pine-apple Nursery, the late Mr. J. Weeks—than whom few men were more zealous and successful in advancing the principles of heating by hot water—here worked out a series of experiments of which we possess the benefit. The old boiler constructed by him is still there, and may be seen working, so that it neither failed nor broke down. True, there is more than one boiler at this establishment, and, owing to the great acreage of glass, we doubt if any one boiler could be made to do the work; but this does not interfere with the fact that what two improved saddles here failed to do is now being easily accomplished by one of our duplex boilers. With regard to the boiler at Columbia Market, it was fixed by us about ten years ago, and successfully worked the apparatus for several years. Of late it has had no fire in it, simply because the hall or market as a market has ceased to exist. So far, however, from the boiler having failed or broken down it still exists as originally fixed, and can be inspected by any one. It has never failed, broken down, or been repaired, and on examination is found to be now in good working condition. *J. Weeks & Co.*

**Heating: Trade Refuse as Fuel.**—In your number of December 20 I advised your readers to burn refuse material for heating purposes and save their coke bill, and that this can be done I have no doubt whatever. For some years prior to 1864 I had great difficulty at my factory in disposing of my trade refuse; my furnaces were small, and nothing but the best coal and coke would keep the steam up. I therefore had two boilers made especially to burn refuse; each boiler was 20 feet long and 7 feet in diameter, of the double-flued Cornish pattern, with very large flues and deep fuel spaces so as to hold a large quantity of fuel. Each fuel space was 7 feet deep and 2 feet 6 inches in diameter, making in all 70 feet super of fire-bar and the contents about 140 feet cube of fuel. The fire traverses the boiler twice, or about 40 feet in all. Now as to its results: from the time of my setting these boilers, sixteen years ago, they have constantly driven a coupled 50-horse high-pressure engine, and except on Sundays and holidays the fires have not been out a week altogether during the whole time. During the whole time not a ton of best coal nor a chaldron of coke has been used, and I have succeeded in disposing of the whole of my trade refuse, and utilising it for fuel with the addition of coal screenings or dust. There are employed an engineer and a stoker, with a man to wheel the refuse from the vertical shaft, which passes through the floors, and is some distance from the stokehole for safety. My stoker estimates the fuel burnt at about fifty barrowloads a-day; it consists of chips, shavings, and sawdust, and my small coal bill averages at the present time 14c. per day, and the water used 2750 gal. a-day, as measured by meter. The best of the shavings and sawdust, amounting to about twenty sacks a-day, are not burnt but are sold, and realise about 35c. per week. I do not consider my arrangements as perfect. I should like to carry the flame once more round the boiler, only the shaft is at the wrong end, and I am strongly of opinion that none of our boilers are swept as often as they should be. A friend of mine has just set a Cornish boiler with a flue space of 3 feet all round it. Supposing the boiler is 4 feet in diameter, the flues added make 10 feet in all; this enables a man to walk round it and thoroughly cleanse it from soot, and everybody knows how much quicker a kettle with a clean bottom will boil than a foul one. At all events, my friend tells me the boiler set in this way does double the work it did before with the same amount of fuel. I think those twisting, cranky flues the curse of the horticultural boilers. I know I shall make boiler-makers open their eyes when I talk of a man walking round his flues, but "out of sight out of mind" applies to foul flues as well as other things, and in heating we must never forget that whilst iron is one of the best conductors of heat, carbon or soot is one of the worst. I will leave your readers to make their own estimate as to the relative power of driving a 50-horse steam-engine and heating hothouses, and how many miles of pipes these boilers would be equal to. This is a point I should much like information on if any

of your readers could supply it. I suppose no one at the present day is simple enough to say that fuel that will get up steam will not heat pipes in a hothouse. Now, a word for the smaller kinds of houses. We don't all want boilers we can walk round; and, for small houses, I quite believe that hot air will drive hot-water boilers out of the field. I have just had a hot-air apparatus advertised in your paper set up in a conservatory, and the advantages I hope to gain are as follows:—In a small house you have your stove-hole where you keep your fuel to heat the boiler; the boiler heats the pipes, and the pipes heat the air. It is hot air you want; but what a roundabout way to get it. Why not do away with the pipes, the stove-hole, the boiler, and put a stove in the house itself? There are difficulties in the way—sulphur is one: this can be obviated by feeding outside; drawing the ashes is another: this can be done by having the ash-door outside; dry heat is another: a large shallow evaporating-pan, kept at a level by a ball-tap and a cistern connected by a pipe, will remedy that. The stove is ugly; well, make it pretty—put a case on it, and make it beautiful for ever. Now, let boiler-makers look at that and look at this, and ask themselves if they have not got into a bad, stupid groove, and whether it is not possible to heat hothouses in a very much less costly method than the present system? *W. H. Lascells, 121, Bunhill Row, E.C.*

**Limekiln Heating.**—For the information of Mr. Cowan, I may state that when engaged in making a limekiln of Weeks' tubular boilers I was a subordinate, consequently his remark on my failing with the tubulars goes for nothing; but I have still a vivid recollection of the trouble that was taken to make it answer. The course pursued was simply this: two of Weeks' large-sized tubulars were fixed side by side, each was filled with coal and chalk in layers, and when one had nearly burnt out the other was lighted; but it never paid for the trouble, and the heating, as may be supposed, was anything but satisfactory. *North Country.*

—I send you an account of fuel consumed here in heating five ranges of early forcing-houses and one range of sheds during the three years 1876-77-78. Each of the five ranges is 100 feet long, and they are each divided into three compartments. They are used for cultivating Pines, Cucumbers, and Melons, stove plants, early Grapes, general forcing, and propagating. The sheds consist of Mushroom-house, potting-shed, seed-room, and fruit-room, all of which are heated. The amount of piping in use, including bottom-heats and mains, is equal to 5000 feet of 4-inch. The boilers (two of Weeks' upright No. 6 tubulars) are placed in a central position, and each boiler is worked every alternate week, and they are so fixed as to allow of a gradual rise in the main flowpipe into the lowest house. The flues are regularly cleaned after each week's work, and every two months the boilers are thoroughly flushed and cleansed from all sediment, by taking out the pads at the base. Neglect of this simple precaution is, I fear, the cause of nine-tenths of the failures which occur to horticultural boilers. To prevent furring by the lime, we use soft water in the apparatus here, and even from this we get a deposit of soot and dirt, which is washed from the roofs of the houses, and would soon prove destructive to any boiler if not removed.

*Amount of Fuel Consumed.*

1876.—64 tons 12 cwt. of culm coal, at 25s. . . . .	£74 7 9
.. 10 tons of chalk, digging and carting, at 18s. 6d. . . . .	0 15 0
1877.—55 tons 17 cwt. of culm, at 20s. . . . .	55 17 0
.. 13 tons of chalk, at 18s. 6d. . . . .	1 7 0
1878.—61 tons 14 cwt. of culm, at 19s. . . . .	53 12 3
.. 20 tons of chalk, at 18s. 6d. . . . .	1 10 0
Total cost of fuel for three years . . . . .	£189 9 0
Deduct value of lime burned and used in the garden, at 68 qrs. at 4s. per quarter. . . . .	23 12 0
Cost of fuel for three years . . . . .	£155 17 0

—or for one year £51 19s. There being eighteen compartments, about 33 feet, by 12 feet wide, to heat, it costs exactly £2 17s. 8½d. per year to heat them, or 1½d. per day. In giving these items, I am not so presumptuous as to think they show greater economy in heating than many others could show if they felt disposed, but my object is to induce others to state the amount of fuel they consume in a given time in heating a specified number of houses of a given area, for what purposes the houses are used, and the quantity of piping employed in heating them. Having failed to attain the object at which we aim, viz., "to prove which is the best boiler, and which the best system of heating," by freely airing out fancies and theories, perhaps this, the more practical method, may in a slight degree aid us in our endeavours to attain that object. That chalk can be used as fuel to advantage when it can be obtained near at hand there can be no doubt whatever, especially in the upright tubulars, where the fuel is directly under, inside, and in direct contact with every part of the boiler. I do not mean by this that any direct heat is obtained from the chalk, but when dry it absorbs and conserves the

heat from the coal, which would otherwise pass into the flue; the greater portion of that heat is again liberated so gradually as to produce a long-enduring moderate heat. Had Mr. Cowan claimed for the limekiln system of heating somewhat less advantages, and had he suspended an upright tubular boiler therein, made to fit the kiln, I venture to think his system would not, even at the present time, be designated a failure by its opponents. We have just added to the present apparatus here 5000 extra feet of piping, to heat a range of late vineries and Peach-houses, which is worked by the same boiler very satisfactorily. If spared till the end of 1880 it will afford me great pleasure to again send you an account of the fuel consumed. *T. Challis, The Gardens, Wilton House.*

## Foreign Correspondence.

**ALONG THE DEDEMVAART.**—I have several times visited remarkable parts of the Netherlands, and long ago resolved on going to the province of Friesland, and stop at the Dedemsvaart, to have a look at the nurseries of one of the old pupils of the horticultural school of Ghent—Mr. A. M. C. Jongkindt Coninck. Besides, having promised to give a lecture on arboriculture at Zwolle and at Arnhem, I wished to avail myself of that opportunity of visiting Meppel, Leeuwarden, Groningen, and Arfen, consequently I had to pass by the Dedemsvaart.

At the hour agreed upon my host met me at the station, and conducted me to his establishment. Unfortunately I was taken ill, and was obliged to return home immediately. I had scarcely time to make a few notes on the nurseries of Mr. Jongkindt Coninck, which, however, are so important, that I think it my duty to him to send you the following lines.

Dedemsvaart is the name of the second station after Zwolle on the railway towards Meppel. It is also the name of an immense district, which stretches for miles from that point. As is still to be seen, the country was a few years ago partially an arid desert, partially a marshy turf-field. But courageous, sagacious, and industrious men united themselves, in order to furnish the necessary capital to make a canal, hours and hours long, provided with several sluices, and serving not only to import turf and wood, to bring manure, &c., but also to make the country wholesome and habitable. At the head of that enterprise stood an active man, Baron van Dedem, one of the chief proprietors of that country. In his honour the canal is called Dedemsvaart, in English Dedem's Canal. But, as often occurs, that gigantic work required enormous sums of money, and in the beginning gave little or no rent, which caused the worthy man to lose a good deal of his fortune. However, people were not ungrateful towards him. His contemporaries erected a monument in his honour, which the passer-by respectfully salutes, when he considers how many thousands of acres of unproductive land have been transformed into a beautiful, populous and industrious country by the Dedemsvaart (Dedem's Canal). From the station to Mr. Jongkindt Coninck's establishment, one and a-half hour's drive along the canal, a vigorous growth of trees, chiefly of Oaks, is to be seen; it is a pity they are so badly pruned. On both sides of the canal fields are being grubbed up: the cultivated ones already produce good crops. Further on people are digging turf, making small canals in connection with the large Dedemsvaart, and bringing the sand from those small canals over the peat in order to improve the soil. It is easily understood that the greatest activity shows itself everywhere. There are not only churches and schools, but also post and telegraph offices, shops, manufactories, and even one devoted to glasswork. Wharfs especially are very numerous; nearly all materials are transported by ships and boats. All the houses are neat, often very elegant, with nice gardens, in which especially Conifers and Rhododendrons do admirably well. Luxury is not known, still less misery.

At last we reached our destination. Mr. Jongkindt Coninck's nurseries comprise at present about 20 acres of excellent land. Convinced that his enterprise will extend, he made the necessary buildings, packing-sheds, propagating-house and frames, but before everything had the land thoroughly drained and trenched, which, of course, was very expensive. To insure a good drainage several narrow but deep ditches have been made; these divide the land into squares of about 50 metres long and 30 metres broad, each square being surrounded by hedges of Abies

excelsa as a wind-break. This is a capital thing, generally practiced in the Netherlands, but too often neglected in other countries. The soil has been trenched at a depth of 1 metre. This labour, already very expensive in ordinary circumstances, was still more so here, because the land was to be levelled, and the peat to be mixed with the sand from the ditches.

Of course, trenching being done in autumn, both peat and sand being exposed to the frosts during winter, excellent soil has been obtained. Besides large quantities of manure have been used. All those heavy expenses and the extraordinary advertisement costs (few Continental nurserymen advertise so largely as Mr. Jongkindt Coninck) will give some idea of the sacrifices he had to make in a country where he is the only nurseryman, and where he has to help himself. I should not have been at all surprised had he been discouraged; however, at present he is pleased with what he has done, and has reason to be proud of it. It was very cold when I visited the said nurseries, but scarcely felt any wind because of the many hedges. The soil, a mixture of peat and sand, is in splendid condition, and very favourable to the growth of almost all sorts of plants. In winter nothing is to be feared from moisture, neither does dryness in summer do any harm. One is entirely master of the water, and able to keep the soil dry in winter and moist in summer. I will explain how such is possible. The nurseries, being surrounded at the south by the Dedemsvaart and at the north by a small river, the water level of which is from 1 to 1½ foot lower than that of the Dedemsvaart, floodgates have been made, by means of which the water level can be regulated as required. This of course is most important. Mr. Jongkindt Coninck chiefly grows perennials, rock plants, bulbs, flower roots, Conifers, fruit trees, Roses, hardy Rhododendrons, and Azaleas, Rose stocks, &c. All plants are grown by the thousand for wholesale, not for amateurs, and sold at very low prices. About 300,000 Rosestocks (*Rosa multiflora de la Grifferaie* and *Rosa Manetti*) are grown and offered at £1 per 1000. The department of fruit trees deserves special mention. There is a complete collection of these, as well as regards the varieties as the different forms. What also attracted my special notice is the large collection of rock plants, planted as in their native spots, on an artificial rockwork made by the proprietor himself. This rockwork, 33 metres long and 22 metres large, has been very naturally made. From the summit, 5½ feet high, a small cascade, making several windings and passing through a grotto, comes down into the surrounding water. The whole rockwork is planted with rock and alpine plants, which grow admirably well and give an excellent idea of what can be done with these lovely plants. Amongst other interesting things I must not forget to mention the winter carpet beds, of which I saw many beautiful specimens. Several rock plants, when planted by themselves, are easily passed by unperceived, because of their being so modest, at least one cannot imagine what effect they produce when planted together and well arranged according to the different colours. Especially in summer one is little aware how much the colours of a great many of these plants get altered in winter; of course the colours are always somewhat faded, but still sufficiently marked to produce a pleasant effect. Near Mr. Jongkindt Coninck's office I saw several of these winter carpet beds, really well made as concerns the form, the design, the symmetrical distribution of the plants, and the different colours. Can any one believe that at a time of the year (it was in the beginning of April) when, especially in that northern country, Nature was still sound asleep, where snow had scarcely disappeared and the soil was still frozen—can any one believe, I say, that already at a distance one is struck by the attractive colours of what at the first sight is thought to be a flower-bed? And still such was the impression which those beds of rock plants produced on me. A great many different plants are suitable for such carpet-beds, but care should be taken only to plant those which sufficiently vary one from another. In a great hurry I marked the following:—

*White.*—*Antennaria tomentosa*, *Crastium Biebersteinii*, *Sedum brevifolium*, *Stachys lanata*, *Veronica meana*.

*Greenish-White.*—*Sedum dasycyllum*, *S. glaucum*.

*Grey.*—*Festuca glauca*, *Senecioium chrysanthum*, *Thymus luviginosus*.

*Yellow.*—*Lamium maculatum aureum*, *Sedum acre aureum*, *Stellaria graninea aurea*.

*Red.*—*Sedum pruinatum*.

*Reddish-Brown*.—Ajuga reptans atro-purpurea, Sem-pervivum fimbriatum.

*Green*.—Saxifraga caespitosa, S. muscoides, Sedum anglicum, S. lydium, Thymus montanus albus.

What variety! And such of plants which withstand any amount of frost, which require no other care than being replanted from time to time. Really one is inclined to use show plants in summer as well as in winter, instead of Alternanthera, Pyrethrum, Coleus, and other plants, which are only effective during three months. My opinion is that rock plants, which are so appropriate for all sorts of designs and edgings, because of their remaining so dwarf and having such characteristic colours in winter, deserve much more attention from a decorative point of view than they have hitherto received.

Whilst most nurserymen in the Netherlands who grow perennials have no frames, a large quantity of these are to be seen here. Mr. Jongkindt Coninck has visited good schools and excellent horticultural establishments in different countries, and very well understood that to grow plants well and in the shortest time possible, glass is indispensable. Besides, he had a propagating-house made, the hot-water apparatus of which also warms two long rows of frames, consequently these are always full of seed-pans, cuttings, grafts, repotted plants, &c.

Everywhere order shows itself, each square has its proper destination, and is as much as possible planted with plants of the same class; thus errors are easily avoided, work is much facilitated, and general inspection greatly simplified. In one word, the nurseries very much pleased me. Although a little out of the way, they greatly deserve to be seen, and may be considered a model of good organisation. The plants sold are cheap and good, their roots are so numerous that it is difficult to shake off the soil; last, not least, one is sure always to be heartily welcome. I experienced this, and present my sincere thanks to Mr. Jongkindt Coninck. *H. J. Van Hulle, Curator, Botanic Gardens, Ghent.*

**BUFFALO, NEW YORK: American Apples.**—In reading the article by "J. S.," in your paper of November 8 last, in his selection of the best Apples to plant I notice that he does not include any one of our four leading winter Apples—viz., Northern Spy, Baldwin, Spitzenberg, and Rhode Island Greening. They are strong growers, heavy croppers, and of the highest quality. They may have all been tried in Great Britain and found wanting in some particular, but I scarcely think they can have been, or they would stand high in the first dozen winter Apples. Our crops in this locality (Western New York), the greatest Apple-producing district in the United States, have been a great contrast to the sad accounts we get from England. Fine fall Apples have been sold at 30 cents per bushel; good winter Apples are now worth 75 cents per bushel. Potatoes are plentiful and good, and worth 50 cents per bushel. In September we bought very fine Peaches at 1.50 dol. per bushel. I think there is nothing, among the many blessings of this country, more enjoyed and appreciated by the emigrant Britisher than the abundance of good wholesome fruit always within reach of the poorest family. *W. S., December 11, 1879.*

**DEPARTMENT OF AGRICULTURE AND COMMERCE, N.-W. P. AND OUDH: Nov. 17, 1879.**—The following is an account of Mango grafting practised with some success as regards number of grafts and cheapness at Allahabad, N.-W. P., India, by the Superintendent of the Government Gardens. I shall be glad to learn whether there is any reason to believe that trees thus raised will be less hardy and fruitful than those which are raised from scions on three year old stocks—the usual practice. As there is a great saving in time and money in raising trees in the method proposed by the Superintendent, I shall be obliged by receiving your opinion, or that of any of your correspondents, on the subject. *E. C. Buck, C.S., Department of Agriculture, N.-W. P.*

*Process of Grafting Mangoes on the Tree.*—The process by which this is accomplished is very simple. In the first place the seedling with seed attached thereto, when it is about 6 or 8 inches high and three weeks old, is carefully lifted with a small ball of earth. The roots, with the earth intact, are then wrapped up in a little grass, and the young seedling plant tied to the tender branch of the tree required to be grafted from, care being taken that the young seedling tree and the branch to be

grafted should lie pointing in the same direction, and be of the same age, i.e., both seedling and graft should be of that year's growth. When grafted the joint should be covered with grafting clay to exclude the air.

"2. The roots of the seedlings, suspended as above described, when grafted must be kept moist by watering, either by hand or with a garden syringe, in case there be not sufficient rain.

"3. The process of grafting should be commenced in the beginning of the rainy season, as soon as the young Mango seedlings are procurable. The plant should be ready for cutting, i.e., the graft should have taken well, within a month; \* but I have succeeded in cutting them so soon as thirteen days after grafting, and the plants so removed are now in good growth in the nursery. In fact, plants thus grafted in this season are now growing strongly and ready for sale. The plants grafted in this way on young wood, where the junction is so complete, will, in all probability, be much stronger than those grafted on two or three years' old plants where, the wood being hard between the grafts, such a complete union is impossible, from which cause a great number of plants die or are broken down by the wind.

"4. The following is the actual cost incurred in raising 2000 grafted Mango trees by the above method:

	Rs.	a.	p.
To digging bed and sowing seed .. ..	1	0	0
.. lifting and tying up plants for grafting ..	4	4	0
.. grafting 2000 plants .. ..	5	0	0
.. Bhusti watering, one month .. ..	4	8	0
.. cutting and planting the young grafted trees in bed .. ..	2	8	0
.. twine for tying plants to trees .. ..	2	2	0
Total .. ..	19	6	0

\* Total say Rs. 20, equal to less than 2 pie per plant; add watering in the nursery for one year, Rs. 10; the plants when ready for sale would thus cost about 3 pie per plant. Plants raised at such a trifling cost, and in such numbers, and which promise to be so hardy, should soon take the place of the common seedling Mango trees on roadsides, canal banks, topes, &c."

**GRAHAMSTOWN BOTANIC GARDEN, CAPE COLONY: Foliage of Plants Injured by the Action of the Sun after Rain (?).**—During the last twenty years it has been my constant practice to disregard the generally received opinion on the above subject; and, with the exception of one family of plants—viz., the Gesneriads—I do not scruple to water all over the foliage of any plant during the hottest sunshine, and to the best of my knowledge I never saw a leaf injured in consequence. We even treat small seedlings just breaking through the soil in this manner; in fact, there is no other way of keeping them alive, unless the beds are shaded, which is not possible at all times. I am so sure of the absence of danger in watering during the heat of the day, that all my seed customers are strongly advised to follow my own practice in this matter, and they do so with good results. Finally, on the principle that "Fools rush in," &c., I may state my opinion to the effect that although it is just possible that drops of water hanging in the foliage of plants may concentrate the rays of the sun in sufficient number to scorch any leaves placed in the exact focus of the said drops, it is not at all probable. By hottest sunshine I mean thermometer at from 130° to 140° in the sun.

*Scale on Fruit Trees, &c.*—The mixture described in the *Gardeners' Chronicle* of October 4 is strongly recommended by me for dressing all hard-leaved plants subject to scale, such as the Orange tribe, Camellias, Crotons, Aucubas, Gardenias, Myrtle and allies, Palms, also Conifers, some of which are much injured by scale—Araucaria excelsa, for instance. I trouble you again on this subject because the above heading is, to my mind, misleading. "Fruit trees" hardly include the above-named subjects. *E. Tidmarsh, Nov. 27, 1879.*

## ROYAL HORTICULTURAL SOCIETY.

THE following are the names and addresses of the gentlemen elected by the Council to serve on the three committees during the present year:—

### SCIENTIFIC COMMITTEE.

*Chairman*.—Sir J. D. Hooker, K.C.S.I., M.D., C.B., F.R.S., V.P.L.S., Royal Gardens, Kew.  
*Vice-Chairmen*.—The Rev. M. J. Berkeley, M.A., F.R.S., Sibbertoft, Market Harborough; Maxwell T. Masters, M.D., F.R.S., Mount Avenue, Ealing, W.; Arthur Grote, F.L.S., 20, Cork Street, Burlington Gardens, W.

\* The graft should be partly secured at first, and completely severed a few days afterwards.

*Secretary*.—Samuel Jennings, F.L.S., 58, Granville Park, Blackheath.

Baker, J. G., F.R.S., Royal Herbarium, Kew.  
Bennett, Alfred W., M.A., B.Sc., F.L.S., 6, Park Village East, N.W.

Blenkins, George E., 9, Warwick Square, S.W.  
Boscawen, Hon. and Rev. J. Townshend, Lamorran, Probus, Cornwall.

Church, A. H., F.C.S., Royston House, Kew.  
Clarke, Colonel R. Trevor, Welton Place, Daventry.  
Cooke, M. C., Ph.D., 2, Grosvenor Villas, Junction Road, N.  
Crewe, Rev. H. Harpur, Drayton Beauchamp Rectory, Tring.

Denny, John, M.D., Stoke Newington, N.  
Dyer, W. T. Thiselton, M.A., B.Sc., F.L.S., Royal Gardens, Kew.

Edgeworth, M. P., F.L.S., 6, Norham Gardens, Oxford.  
Gilbert, J. H., Ph.D., F.R.S., Harpenden, St. Albans.  
Hemley, W. B., A.L.S., 2, Woodland Cottages, Gunnersbury.

Henslow, Rev. G., F.L.S., 6, Tichfield Terrace, Regent's Park, N.W.

Hogg, Robert, LL.D., F.L.S., 99, St. George's Road, Pimlico, S.W.  
Joad, George Curling, F.L.S., Oakfield, Wimbledon Park, S.W.

Maw, George, F.L.S., Benthall Hall, near Broseley.  
McLachlan, R., F.R.S., Limes Grove, Lewisham.  
Moore, F., F.Z.S., 110, Oakfield Road, Penge, Surrey.

Renny, J., 106, Warwick Street, Pimlico, S.W.  
Scofield, W. J., M.R.C.S., 13, South Hill Park Gardens, Hampstead, N.W.

Smith, Worthington G., F.L.S., 125, Grosvenor Road, Canonbury, N.  
Webb, Sydney, Redstone Manor House, Redhill.

Wilson, Geo. F., F.R.S., Heatherbank, Weybridge Heath.

### FRUIT COMMITTEE.

*Chairman*.—Henry Webb, Redstone Manor House, Redhill.  
*Vice-Chairmen*.—John Lee, Royal Vineyard Nursery, Hammersmith, W.; Philip Crowley, Waddon House, Croydon; William Paul, F.L.S., Waltham Cross, N.

*Secretary*.—Archibald F. Barron, Royal Horticultural Society, Chiswick, W.

Badger, E. W., Mostyn Villa, Mosely, Birmingham.  
Beale, E. J., F.L.S., Stoneydeep House, Teddington Grove, S.W.

Berkeley, Rev. M. J., F.R.S., Sibbertoft, Market Harborough.  
Bunyard, George, The Nurseries, Maidstone.

Cox, John, Redleaf, Penshurst, Kent.  
Dancer, F. N., Chiswick.  
Gardiner, William, The Gardens, Elington Park, Stratford-on-Avon.

Haycock, Charles, The Gardens, Barham Court, Maidstone.  
Hogg, Robert, LL.D., F.L.S., 99, St. George's Road, Pimlico, S.W.

Killick, Lewis A., Mount Pleasant, Maidstone.  
McKinlay, Peter, Headley Lodge, Croydon Road, Penge, S.E.

Miles, G. T., The Gardens, Wycombe Abbey, High Wycombe.  
Nutting, W. J., 60, Barbican, E.C.

Osborn, Robert, Fulham, S.W.  
Sage, George, The Gardens, Ashridge Park, Berkhamstead.  
Silverlock, Charles, 412, Strand, W.C.

Smith, J., The Gardens, Mentmore, Leighton Buzzard.  
Smith, W. Baxter, 3, Broadlands, S. Northwood.  
Stevens, Zadok, The Gardens, Trentham Hall, Stoke-on-Trent.

Veitch, H. J., F.L.S., Royal Exotic Nursery, Chelsea, S.W.  
Weir, Harrison, Weirleigh, Brenchley, Staplehurst.

West, James Firth, Lynnwood Lodge, Reigate.  
Wildsmith, W., The Gardens, Heckfield Place, Winchfield.  
Wood, Charles, Woodlands Nursery, Maresfield, Uckfield.  
Woodbridge, John, The Gardens, Syon House, Brentford, W.

### FLORAL COMMITTEE.

*Chairman*.—John Denny, M.D., Stoke Newington, N.  
*Vice-Chairmen*.—Charles Noble, Bagshot, Surrey; James McIntosh, Dunevan, Weybridge; W. B. Kellock, F.L.S., Stamford Hill, N.

*Secretary*.—Archibald F. Barron, Royal Horticultural Society, Chiswick, W.

## Reports of Societies.

**Scottish Horticultural Association.**—The usual monthly meeting of this Association was held on Tuesday, the 6th inst., at 5, St. Andrew Square, Edinburgh, Mr. Dunn, Dalkeith Gardens, presiding. Mr. George Robertson, Mordington Gardens, Berwick-on-Tweed, read a paper on herbaceous plants, his object being to enlist the sympathies of members in their behalf as substitutes for the more transitory and often disappointing tender plants that now occupy our flower gardens. No gardener could forget the anxiety and labour expended on the tender occupants of the flower-beds last summer, and the poor results secured by his painstaking. The points which he paid particular attention to in the cultivation of these, were their propagation, the preparation of the soil, and the production and arrangement of colour. He gave a description of his mode of planting so as to produce a constant succession of flowers from March to November. Some discussion ensued, and a hearty vote of thanks was given to Mr. Robertson for his paper.

Mr. P. W. Fairgrieve, gr. to the Dowager Duchess of Athole, Dunkeld Gardens, afterwards read a thoroughly instructive practical paper on "The Culture of Hardy Stoned Fruits," the result of his own experience in the Highlands. After some preliminary remarks as to the interesting character of fruit culture, he gave an idea of the situation of Dunkeld Gardens. They were situated on a delightful slope, and the ground was well sheltered on every side. The gardens were, he believed, formed by His Grace John, fourth Duke of Athole, well known to horticulturists as "the planting Duke." They stood about 176 feet above the sea level at the lowermost and about 244 feet at the uppermost part. His Grace must have had an eye to fruit-growing, if they judged from the positions of the walls and the various aspects thereby gained. He exhibited a plan of the gardens to illustrate what he said, and observed that the Duke must have had as good an idea of the science of horticulture as they had now. The soil was of light loam, with a gravelly subsoil, which he thought, with a little assistance, suited the cultivation of stoned fruit admirably. Selection of the fruit to be grown was a very important matter, and he thought was too little practised as a branch of fruit-growing. Judicious selection must always hold a paramount place to having a large number of varieties. He then gave a few general hints as to the rearing of Peaches, Apricots, Nectarines, and Plums. He named a few of the varieties of each of these fruits which he thought were the best and most remunerative for growing. Among the varieties of Peaches which he mentioned were the Early York, which was a good Peach, of capital colour and flavour; the Early Alfred was a fine variety, with beautiful flesh. Hale's Early was also an excellent new variety. Among the Nectarines he specially mentioned the Balgowan and the Pineapple. Apricots required a stiffer soil. Of the Plum there were a great many varieties, but he thought most of the Kirke's Seedling. He concluded by laying great stress on the importance to fruit-growers of keeping the trees clean. The trees ought to be syringed at least twice during the season, and for this purpose he used a liquid of his own for exterminating vermin. He also called attention to the mode he had of protecting his out-of-door trees from frost by the exhibition of a model framework, which was covered with Frigi Domo, and which could be drawn up like a blind when necessary. He said he had found it very effective, that it cost about 1s. per superficial yard, and would protect the borders with early vegetables also. Mr. Fairgrieve received the thanks of the meeting for his paper.

The following subjects were exhibited:—From Mr. A. McMillan, Broadmeadows, twenty varieties of Chrysanthemums, sixteen of Cinerarias, sixteen of single Zonal Pelargonium trusses, sixteen of double Zonal Pelargonium trusses, and one Carnation bloom—Souvenir de la Malmaison; from Messrs. Downie & Laird, two trusses of Rhododendron—Princess Alexandra and Jasminiflora; from Mr. John Forbes, Hawick, Calceolaria deflexa in flower; from Mr. Laurence Dow, Saughtonhall, a bloom of Lasiandra macrantha; from Dr. Paterson, Bridge of Allan, the original white variety of Odontoglossum Alexandra, which was very much admired; and from Messrs. Todd & Co., West Maitland Street, a table bouquet, consisting of Roses, Lily of the Valley, and Maiden-hair Ferns.

## Obituary.

We have to record the death of Mr. THOMAS STANSFIELD, of Tanshelf Nursery, Pontefract, which took place on December 30. Mr. T. Stansfield—Tom Stansfield as he was familiarly called amongst his friends—was well known as a member of the firm of A. Stansfield & Sons, of Todmorden, one of the nursery establishments in which the cultivation

of British and exotic Ferns was taken up many years ago in good earnest, and which has always since maintained a good reputation for cultivating an extensive collection, with a trustworthy nomenclature. The Stansfields, father and sons, were, indeed, not merely cultivators of Ferns, they were collectors also; and for the knowledge of many novel additions of great interest and beauty to our Fern lists we are indebted to them. They were moreover raisers of Fern novelties, and for several interesting and ornamental hybrid forms we have to thank them. In all this work our deceased friend was for many years intimately mixed up. So great was his knowledge of these plants, so wide-spread his acquaintance with Fern lovers, and so genial his disposition, that many members of the fraternity of British pteridologists will deeply regret to learn that his smiling cheerful countenance will no more be seen amongst his favourite plants, of which he has generally kept a good illustrative collection before the public at the principal exhibitions held in that part of the country. Mr. T. Stansfield had attained the age of fifty-three years, and was interred at Christ Church, Todmorden, on Saturday last.

— We also note the death, on December 20, of Mr. JOHN GRIER, of Ambleside, Westmoreland, a well-known nurseryman in the Lake district, where he had carried on business for many years.

Jan. 1.—A dull overcast day. Very mild. Strong wind. Rain fell before 9 A.M.  
 2.—A fine bright day. Mild. Colder at night. Gale in early morning. Few drops of rain at 9 A.M.  
 3.—A very fine day. Pleasant. Little colder.  
 4.—A very fine bright day. Clear. Colder. Cloudy at night.  
 5.—A fine day. Much colder. Some fog in morning.  
 6.—Overcast, dull, and cold throughout.  
 7.—A very dull overcast day. Cold. Thin mizzling rain at night.

**LONDON: Barometer.**—During the week ending Saturday, Jan. 3, 1880, in the vicinity of London the reading of the barometer at the level of the sea decreased from 30.27 inches at the beginning of the week to 29.64 inches by the afternoon of December 30; increased to 29.78 inches by the morning of the last day of the year, decreased to 29.67 inches by the afternoon of the same day, and increased to 30.50 inches by the end of the week. The mean reading for the week at sea level was 30.02 inches, being 0.50 inch below that of the preceding week, and the same as the average.

**Temperature.**—The highest temperatures of the air observed by day varied from 54½° on January 1, and 52° both on December 28 and 31, to 44° on December 30; the mean value for the week was 50¼°. The lowest temperatures of the air observed by night varied from 32½° on December 31 to 49° on January 1; the mean value for the week was 38¾°. The mean

daily range of temperature in the week was 11½°; the greatest range in the day being 19½°, on December 31, and the least 5½°, on January 1.

The mean daily temperatures of the air and the departures from their respective averages were as follows:—Dec. 28, 46°.3, +8°.8; 29th, 44°.9, +7°.5; 30th, 39°.4, +1°.8; 31st, 44°.2, +7°.1; Jan. 1, 52°, +14°.8; 2d, 46°.3, +9°.4; 3d, 42°, +5°.1. The mean temperature of the air for the week was 45°, being 7°.8 above the average of sixty years' observations, and 4° higher than the value for the corresponding week in 1879.

The highest readings of a thermometer with blackened bulb in vacuo, placed in the sun's rays, were 72° on December 29, 67° on January 3, and 65° on January 2; on the remaining days the highest readings were between 50° and 55°. The lowest readings of a thermometer on grass, with its bulb exposed to the sky, were 30° on December 31, and 30½° on the 30th. The mean of the seven lowest readings was 35°.

**Wind.**—The direction of the wind was W.S.W. and S.W., and its strength strong. The weather during the week was generally fine, though occasionally dull and very mild; the thaw which set in on December 28 continued throughout the week. A thunderstorm, accompanied by hail and rain, occurred at 1 P.M. on Tuesday, December 30.

Rain fell on four days during the week; the amount measured was 0.51 inch.

**ENGLAND: Temperature.**—During the week ending Saturday, January 3, 1880, the highest temperatures of the air observed by day were above 55° at Bristol, Cambridge, Norwich, Nottingham, and Sunderland, and below 50° at Brighton; the mean value from all stations was 54½°. The lowest temperatures of the air observed by night were below 32° at Cambridge, Norwich, Wolverhampton, Nottingham, and Bradford; and above 35° at Plymouth and Leeds. The mean from all stations was 32½°. The extreme range of temperature in the week was above 26° at Cambridge and Nottingham, and below 16° at Plymouth and Brighton; the mean range of temperature in the week from all stations was 22°.

The mean of the seven high day temperatures was above 51° at Truro, Plymouth, Cambridge, and Nottingham, and below 49° at Brighton and Hull; the mean value from all places was 50¼°. The mean of the seven low night temperatures was below 39° at Brighton, Blackheath (London), Wolverhampton, Nottingham, Hull, Bradford, and Sunderland, and above 43° at Truro and Plymouth; the general mean from all stations was 39½°. The mean daily range of temperature in the week was above 12° at Wolverhampton, Nottingham, and Sunderland, and below 10° at Truro, Plymouth, Bristol, and Sheffield; the mean daily range of temperature from all places was 11°.

The mean temperature of the air for the week from all stations was 44½°, being 5¼° higher than the value for the corresponding week in 1879. The mean temperature of the air was above 47° at Truro and Plymouth; and below 44° at Brighton, Wolverhampton, Hull, Bradford, and Sunderland.

**Rain.**—Rain fell on every day in the week at Bristol and Bradford, and on five or six days at most other places. The heaviest falls were 1.82 inch at Bradford, and 1.69 inch at Sheffield; and the least falls were 0.13 inch at Cambridge, and 0.33 inch at Norwich; the average fall over the country was three-quarters of an inch.

The weather during the week was somewhat fine, though the sky was generally cloudy, and frequent rain fell. The thaw which set in on Sunday, December 28, continued throughout the week; the weather was very mild.

Thunderstorms were pretty general over the country on Tuesday, December 30.

**SCOTLAND: Temperature.**—During the week ending Saturday, January 3, 1880, the highest temperatures of the air observed by day varied from 57° at Perth, and 56½° at Leith, to 54¾° at Edinburgh and Greenock; the mean value from all places was 55½°. The lowest temperatures of the air observed by night varied from 29° at Perth to 34¾° at Leith; the mean from all stations was 32¼°. The mean range of temperature in the week from all places was 23½°.

The mean temperature of the air for the week from all stations was 42½°, being 8° higher than the value for the corresponding week in 1879. The mean temperature was the highest at Leith, 45½°, and the lowest at Dundee, 41¼°.

**Rain.**—The amount of rain measured at Greenock was 3.85 inches, and at Perth 2.58 inches, whilst at Aberdeen the amount was 0.53 inch only; the average fall over the country was 1.69 inch.

**DUBLIN.**—The highest temperature of the air was 56½°, the lowest 33°, the extreme range 23½°, the mean 45¾°, and the fall of rain 0.93 inch.

JAMES GLAISHER, F.R.S.

**Variorum.**

**HYOPHORBE VERSCHAFFELTI** (Wendl., in *III. Hort.*, tt. 462, 463).—A Palm spread over the whole island (Rodriguez), but never occurring on the coralline limestone. It is of a very striking appearance by reason of the bulging which takes place in the stem towards the middle, the stem on both sides of the swelling decreasing in size. If the tree be lofty there may be a second ventricosity. But the tree seems rarely to attain an altitude above 20 feet to 25 feet. The external hard part of the stem is very thin, not more than 1 inch thick, and within it is a soft succulent mass of cellular tissue and fibro-vascular bundles. The juice from this tree is said by the inhabitants not only to be unwholesome, but even poisonous, causing, if taken in small quantities, severe emesis. The leaves have an exceedingly plumose appearance, and with their yellow stripe beneath are very picturesque. The parts of the tree are put to no use. Hyophorbe, to which the species belongs, is a Mascarene genus represented by only three species. Of these, the one here mentioned is endemic in Rodriguez. *H. amaricaulis*, Martius, *Hist. Palm.* iii. 399, formerly cultivated in Europe under the name *Areca speciosa*, is a second species endemic in Round Island, about six miles from Mauritius. This, from its habit, is not unfrequently termed in Mauritius the "Bottle Palm," and hence it has for long been confounded with the Chilean Bottle Palm, *Jubaea spectabilis*, with which, however, it has no connection. The Rodriguez Palm, I should have said, has also been confounded with *Jubaea*. The Round Island Palm is very distinct from the Rodriguez plant. The third species is the most delicate. Originally described as *Hyophorbe indica*, by Gärtn., *de Fruct.* ii. 186, the name, *H. Commersoniana*, was substituted by Martius, *Hist. Palm.* iii. 164. There seems, however, no sufficient ground for the alteration. BORY ST. VINCENT, *Voy.* ii. 296, mentions and describes this Palm as *Areca lutescens*, under which name it is frequently and most commonly met with in gardens. The species has a wider distribution than the others, occurring in both Mauritius and Bourbon. It is in these islands confined to the shady parts of the woods and valleys, and is now extremely rare. It differs in habit from the other species in having a slender tapering stem, not dilated, and with no ventricosities. *Dictyosperma album*, Wendl., in *Linnaea*, xxxix. 181, var. *aureum*; *Areca alba*, Bory, *Voy.* i. 306. This palm is very abundant in Rodriguez, growing freely both on the volcanic soil and on the coralline limestone. It has for many years been cultivated in the gardens of Europe as *Areca aurea*. This is a very variable plant, and by reason of this several garden names have been given to its forms under cultivation. Thus we have *Dictyosperma furfuraceum*, D. rubrum, and D. aureum. These are, however, all varieties of the one Palm, *Dictyosperma album*, Wendl., and the last-mentioned is that form which occurs in Rodriguez. *J. Bayley Balfour, on the Botany of Rodriguez.*

**VERTICAL AND HORIZONTAL LEAVES.**—Grisebach, in his account of the vegetation of Australia,\* dwells on the close relation of interdependence which exists between the tree vegetation and the coating of grass which covers the ground beneath it, and remarks that the amount of light allowed by the trees to reach the ground beneath them is rendered more than usually great by the vertical position in which their leaves grow. Hence the growth of the grass beneath is aided. It may be that this permitting of the growth of other plants beneath them, and consequent protection of the soil from losing its moisture, besides other advantages to be derived, is the principal reason why, as is familiarly known, two widely different groups of Australian trees, the Eucalypti and Acacias, have arrived at a vertical instead of a horizontal disposition of their leaves by two different methods. The Acacias have accomplished this by suppressing the true horizontal leaves, and flattening the leaf-stalks into vertical pseudo-leaves, or "phyllodes." The Gum trees, on the other hand, have simply twisted their leaf-stalks, and have thus rendered their true leaves vertical in position. There must exist some material advantages which these different trees derive in common from this peculiar arrangement, and the benefit derived from relation to other plants

by this means may be greater and more important than that arising from the fact that the vertical leaves have a like relation to the light on both sides, and are provided with stomata on both faces. In support of this conclusion I was told when at Melbourne that when the native vegetation was cleared away from under Gum trees they ceased to thrive, and in time perished. I was shown a number of Gum trees not far from the city, scattered over some public land, covered with only short turf, which seemed to be mostly in a dying condition. *Notes of a Naturalist on the "Challenger,"* by H. N. Moseley.

**Enquiries.**

*He that questioneth much shall learn much.*—BACON.  
**GREENING OF ARTIFICIAL LAKE.**—I have a small artificial lake, cemented at the bottom and sides, about 20 yards long by 10 broad, in the middle of which is a fountain supplied from the main. There is an outlet for the water near the ground, but I am compelled—especially in the summer—to clean and paint it all over about every two or three weeks, owing to the whole bottom and sides becoming so green with some short vegetable growth. Will any of your correspondents tell me how I can prevent this forming? *Water Lily.*  
**WHITE AZALEAS.**—If any of your readers know of any better white Azaleas for the cut flower and marketing trade than A. Felderi, I should be much obliged if they would give me their names. *H. T. S.*

**APPLE TREES DYING:** *H. P.* Your Apple twigs are not affected with American Blight, but there is the spawn of a Fungus on them—of what species cannot be ascertained without fruit. *M. J. B.*

**BAROMETRICAL TABLES** (see p. 24): If "R. R." will send thirteen stamps to Mr. H. West, 73, Upper Kennington Lane, S.E., he will receive a book of barometrical tables for one year, which will answer his purpose exactly. The linear system is, of course, preferable to that recommended. *H. King, Captain R.N.*—"R. R." should apply to Mr. G. J. Symons, 62, Camden Square, N.W.; or to Mr. Stanford, of Charing Cross, who supply Meteorological Registers for one year in stiff covers at 2s., ruled for two observations daily for barometer, thermometer, wind, rain, &c., with the opposite page blank for observations. Diagram sheets can also be had for barometrical, thermometrical, &c., readings. *J. E., North Wales.*

**BOOKS:** C. H. I. Thompson's *Gardeners' Assistant*, 35s. (Blackie & Co.); 2, *The Farmers' Calendar*, 15s. (Warne & Co.); 3, tastes differ. Ask your publisher to advise you.—*J. F. Bate's The Art of Budding and Grafting*, published at the Garden office, Southampton Street, Strand, W.C.

**CATALOGUE:** *Troublesome.* Perhaps it was Biddle's, of Loughborough, Leicestershire.

**CLIMBERS FOR VERANDAH:** *J. B. J.* *Jasminum officinale*, or *J. revolutum*; *Clematis lanuginosa* and *lanuginosa nivea*, *Bigonia capreolata*, or some of the finely coloured varieties of *Pyrus japonica*.

**CYPRIPEDIUM MAULEI:** *J. Cocker & Sons.* *Cypripedium Maulei* is a variety of *C. insigne*, but superior to the type. It has a much larger proportion of white on the back sepal, and the spotting on the white portion is purple.

**FUNGUS:** *O. M. B., Isle of Wight.* Your fungus is one of the Sturdy Puffballs, probably *Geaster fibriatus*—i.e., if the mouth, A, is finely frimbriate, like the folds of a minute fan.

**KAINIT AND WOOL MANURE:** *Jardinier.* Kainit is a sulphate of potash mixed with other salts, and costs about £4 a ton. It would be a good manure for Vines. Wool manure would be very useful as a slowly acting nitrogenous manure—like shoddy. We do not know the price. Any dealer in artificial manure would supply your requirements.

**MUSHROOMS:** *C. S., Hemel Hempstead.* We have frequently seen Mushrooms and other Agarics in a similar condition with those sent by you—viz., bloated stems and no tops, or with tops so distorted as to be unrecognisable as such, the Fungi being in shape like irregular massive clubs. We believe the distortion is caused by frost whilst the plants are making growth. The specimens may be wholesome, though far too ugly and suspicious-looking for the table. They probably differ in edibility, the same as Potatoes and some other esculents differ after frost either for good or bad.

**NAMES OF PLANTS:** *J. B. J.* *Cotoneaster Simonsii.*—*A. J. Maule.* *Sarcanthus pallidus.*

**RESPONSIBILITY FOR DAMAGING A BOILER.** *J. S.* does not say whether C was the agent of A, or whether B simply followed his advice. At any rate B was rather simple to light a fire before seeing whether there

was water in the boiler. Such simplicity makes B morally responsible, if not legally.

**SEEDS:** *D. M. G.* We cannot answer either of your questions. Write to the growers direct.

**THE WOODLOUSE:** *M.* The female insects (myriapods) carry their eggs in a pouch, where they are hatched. The young resemble their parent, except in being very small, more clumsy in make, and in wanting one of the seven pairs of legs of the adult insect. They cast their skins, their transformations resembling those of the cockroach. *L. O. H.*

**VINE ROOTS:** *Troublesome.* The roots are dead, but in the absence of any information as to the treatment they have received, we cannot suggest the cause. You should encourage them to root nearer the surface by replacing as much as you can of the present soil with a fresh compost.

\* \* \* Correspondents are specially requested to address, post-paid, all communications intended for publication to the "Editors," and not to any member of the staff personally. The Editors would also be obliged by such communications being sent as early in the week as possible. Correspondents sending newspapers should be careful to mark the paragraphs they wish the Editors to see. *Letters relating to ADVERTISEMENTS, or to the supply of the Paper, should be addressed to the Publisher, and not to the Editors.*

FOREIGN SUBSCRIBERS sending Post-office Orders are requested to make them payable at the post-office, King Street, Covent Garden, London, and at the same time to inform the Publisher at the office of this Journal.

**CATALOGUES RECEIVED:**—Messrs. Thos. Methven & Sons (15, Princes Street, Edinburgh), Catalogue of Garden, Flower, and Agricultural Seeds, &c.; also Select Descriptive List of Gladioli.—Messrs. C. Daly & Son (13 and 15, Bridge Street, Coleraine), Catalogue of Roses; also General Catalogue of Forest and Fruit Trees, Shrubs, Herbaceous Plants, &c.—Messrs. James Dickson & Sons (108, Eastgate Street, Chester), Catalogue of Seeds, Potatoes, Tools, &c.—Messrs. Samuel Finney & Co. (35, Mosley Street, Newcastle-upon-Tyne), Catalogue of Vegetable and Flower Seeds.—Messrs. Ireland & Thomson (20, Waterloo Place, Edinburgh), Catalogue of Vegetable and Flower Seeds, Gladioli, &c.—Messrs. Daniels Brothers (Norwich), Illustrated Descriptive Catalogue and Amateurs' Guide.

**COMMUNICATIONS RECEIVED:**—*Troublesome* (thanks for the seed).—*J. Laing & Co.*—*T. King.*—*J. H. C.*—*C. & S.*—*Veitch & Sons.*—*H. L.*—*W. L.*—*M. B. A.*—*R.*—*Douglas & Sons.*—*Florist.*—*T. B.*—*F. W. B.*—*R. D.*—*E. G. H.*—*One who has seen a thing or two.*—*J. R. J.*—*N. E. Br.*—*M. J. B.*—*J. G.*—*J. M.*—*J. V.* (with thanks).—*R. J.*—*M. H.*—*J. P.*—*J. S.*—*H.*—*T. W.*

**Markets.**

COVENT GARDEN, January 8.

Trade somewhat improving, with a better demand for high-class goods, while inferior samples meet with little encouragement. American Apples and St. Michael Pines are still arriving in large quantities, the former in rather better condition. *James Webber, Wholesale Apple Market.*

PLANTS IN POTS.

Table listing various plants in pots with prices in s. d. s. d. format, including Arum Lilies, Azaleas, Begonias, Bouvardias, Chrysanthemums, Cinerarias, Cyclamen, Cyperus, Dracaena terminalis, Erica gracilis, Euonymus, Ferns, Ficus elastica, Foliage Plants, Fuchsias, Hyacinths, Myrtles, Palms, Pelargoniums, Poinsettia, Primula, Solanum, and Tulips.

SEEDS.

LONDON: Jan. 7.—Increased activity is now seen on the seed market, and on all sides there is more disposition for business. Fine parcels of yearling English red Clover are exceedingly scarce. One parcel realised this week on Mark Lane £5 per cwt. Not a single new sample has yet come to market. Of American seed the arrivals into London continue on a surprisingly moderate scale. For choice Trefoil high prices are obtained. In white Clover the late advance is well maintained. Timothy is in very short supply. A good business is passing in Italian Rye-grass, and rates are steadily advancing: to-day's quotation is 7s. per bale above that ruling a month ago. The available stocks in France and also here are at an unusually low ebb. The trade for Canary seed is inactive; Hemp and Millet seed are both about 1s. per quarter higher. Boiling Peas move off slowly on former terms. No change in Linseed, Haricots, or Lentils. Spring Tares meet a greatly improved inquiry. John Shaw & Sons, Seed Merchants, 37, Mark Lane, London, E.C.

CORN.

Trade at Mark Lane on Monday was much in the same state as last reported. Holders of Wheat demanded full prices, and a small business was concluded. The paucity of business, however, made it a difficult matter to maintain quotations. Barley was dull, and prices as regards feeding qualities were rather easier. Malt was quiet and unaltered. For Oats quotations gave way to a slight extent. Maize was from 6d. to 1s. per quarter cheaper on the week. For Beans and Peas prices were unchanged. Flour was in full supply, and the turn easier.—On Wednesday trade was quiet, Wheat, both English and foreign, sold slowly at late rates. With regard to Barley, fine malting produce remained firm; but grinding samples were weak. Oats were neglected, and rates were perhaps a shade easier. Maize met with a moderate demand at former currencies. Peas and Beans were unaltered, while the flour market was inactive at late rates.—Average prices of corn for the week ending Jan. 3, 1880:—Wheat, 46s. 11d.; Barley, 37s. 7d.; Oats, 21s. 7d. For the corresponding period last year:—Wheat, 39s. 7d.; Barley, 38s. 10d.; Oats, 20s. 3d.

CATTLE.

At Copenhagen Fields on Monday prices advanced for all kinds of beasts, and a clearance was effected earlier than usual. Prices for sheep were on the average lower, and it was difficult to clear out. Trade was dull for calves at about late rates. Quotations:—Beasts, 4s. 6d. to 5s. 2d., and 5s. 6d. to 6s. 2d.; calves, 5s. to 6s.; sheep, 5s. to 5s. 4d., and 5s. 10d. to 6s. 8d.; pigs, 3s. 8d. to 4s. 8d.—Thursday's trade was firm. Supplies of all kinds were short. There was not much animation in the demand, but both beasts and sheep were rather higher in value than above recorded. Calves were steady.

HAY.

The Whitechapel Market report for Tuesday states that good qualities were firm, and supplies fair. Quotations:—Prime Clover, 100s. to 126s.; inferior, 70s. to 95s.; prime meadow hay, 82s. to 95s.; inferior, 60s. to 75s.; and straw, 30s. to 37s. per load.—On Thursday there was a fair supply of fodder on sale. The trade was rather quiet, except for best Clover, prices for which were dearer.—Cumberland Market quotations:—Superior meadow hay, 98s. to 105s.; inferior, 42s. to 80s.; superior Clover, 120s. to 130s.; inferior, 80s. to 105s.; and straw, 36s. to 40s. per load of 36 trusses.

POTATOS.

The Borough and Spitalfields Markets reports state that sound Potatos command a steady inquiry, but there is not much demand for inferior sorts. The supplies are moderate. Scotch Regents, 130s. to 160s.; do. Champions, 140s. to 150s.; Lincoln Regents, 140s. to 150s.; French whites, 85s. to 95s. per ton.—The imports into London last week were very limited, the total receipts from the Continent barely exceeding 1000 bags. There have been several small consignments from the United States, and 1772 barrels were also received from Halifax.

COALS.

The figures current at market during the week have been as follows:—Beside West Hartley, 14s. 3d.; East Wylam, 16s.; West Hartley, 14s. 3d.; Walls End—Hetton, 16s. 6d.; Hetton Lyons, 15s.; Hawthorns, 15s. and 15s. 3d.; Lambton, 16s.; Original Hartlepool, 16s. 6d.; Wear, 15s.; Tunstall, 15s.; Tees, 16s. 3d.; Radford Navigation, 16s.; Chilton Tees, 15s. 6d.; East Hetton, 16s. and 16s. 6d.; South Hartlepool, 15s. 3d.

TRY AMIES' MANURE. It has stood the public test for 9 years, and proved to be the most Successful and the Cheapest Manure for FLOWERS, FRUITS, AND VEGETABLES. Before ordering Manure send Post Card for our New Pamphlet, Post Free.

AMIES' CHEMICAL MANURE COMPANY, LIMITED, 79, MARK LANE, LONDON E.C.

An Important Discovery. SOLUBLE FIR TREE OIL INSECTICIDE.—The cheapest and best of all insecticides for small and large nurseries, plantations, &c. Once tried always used. Full directions with each Bottle, price 1s. 6d., 2s. 6d. and 12s. 6d. each. Special quotations for large quantities. London Agents: HOOPER AND SONS, Covent Garden; and from all Seedsmen. Manufactured by E. GRIFFITHS HUGHES, Operative Chemist, Victoria Street, Manchester.

CUPISS'S CONSTITUTION BALLS.

This justly celebrated Medicine for more than 30 years has proved to be the best and cheapest for HORSES AND NEAT CATTLE, Cheaper because required to be given only once a week, and not every second or third day, PRESERVING HEALTH, VIGOUR AND CONDITION.

Their cost, too, is saved by the food turning to a better account, for it is a fact that Horses will keep up their condition better upon three feeds of Oats daily when a Ball is occasionally given than with four feeds without the Balls.

REARERS OF NEAT CATTLE

Will find the Balls most valuable, not only in case of disease, but in Rearing Young Stock, they will Grow to a Larger Size, come to Perfection Sooner, and to a Greater Weight with the same quantity of food if a Dose (see directions) of the Balls is given occasionally.

Prepared by the Proprietor, FRANCIS CUISS, M.R.V.C.S., DISS, NORFOLK. Author of the PRIZE ESSAY on the "Diseases of the Liver of the Horse."

Sold by all Chemists, in Packets at 1s. 9d. and 3s. 6d. each; or 7 large Packets for 21s., or 7 small for 10s. 6d. Gentlemen using the Balls may consult the Proprietor gratuitously.

For Sale, Wholesale, EXCELLENT CATTLE FOOD—extract of Vegetables; on board at Rouen or Dunkirk. Address, Mr. PETITHUGUENIN, Genlis, France (Côte d'Or), in French Language, and forward Testimonials.

WHOLESALE RUSSIA MAT MERCHANTS.—New Archangel and St. Petersburg MATS of every description. RAFFIA FIBRE. MARENDAZ AND FISHER, 9, James Street, Covent Garden, London, W.C.

MATS, RAFFIA for TYING, TRAINING STICKS and LABELS, Bamboo Canes, Virgin Cork, &c.

C. J. BLACKITH AND CO., COX'S QUAY, LOWER THAMES STREET, LONDON.

ANDERSON'S RUSSIA MATS For COVERING, TYING, and PACKING, are highly recommended for durability and cheapness. Description Catalogue sent post-free on application. SACKS and BAGS of every description. TARPULINS, HORSE-CLOTHS, ROPES, LINES, and TWINES.—JAMES T. ANDERSON, 149, Commercial Street, Shoreditch, London, E.

ARCHANGEL AND PETERSBURG MAT MERCHANTS AND IMPORTERS.

All the usual kinds at reduced rates. SACKS and SEED BAGS, new and second-hand, of every description, RAFFIA FIBRE, NETTING and TIFFANY, TARPULINS, RICK COVERS, HORSE-CLOTHS, ROPES, LINES and TWINES. Price LIST on application to J. BLACKBURN AND SONS, 4 and 5, Wormwood Street, London, E.C.

GARDEN STAKES, LABELS, VIRGIN CORK, MATS, RAFFIA, &c. None cheaper. Prices of WATSON AND SCULL, 90, Lower Thames St., London, E.C.

Under the Patronage of the Queen. J. SMITH'S IMPERISHABLE STRATFORD LABELS.

The above Labels are made of a White Metal, with RAISED BLACK-FACED LETTERS. The Gardeners' Magazine says:—"We must give these the palm before all other plant labels, as the very first to merit." Samples and Price Lists free. J. SMITH, The Royal Label Factory, Stratford-on-Avon.

BELGIAN GLASS for GREENHOUSES, &c.,

Can be obtained in all sizes and qualities, of BETHAM & SON, 9, LOWER THAMES STREET, LONDON, E.C. B. & Son have always a large Stock in London of 20-in. by 12-in., 20-in. by 14-in., 20-in. by 16-in., 20-in. by 18-in., in 16-oz. & 21-oz.

HORTICULTURAL WINDOW GLASS,

15-oz. and 21-oz., in Boxes containing 200 feet, Carriage Paid to any Railway Station in England. Price Lists on application. ALFRED SYER, Glass, Lead, Zinc, Oil and Colour Merchant, 6 and 8, Pentonville Road, London, N.

THE ABOVE and many other PATTERNS are made in materials of great durability. The plain sorts are specially suited for KITCHEN GARDENS, as they harbour no Slugs or Insects, take up little room, and, once put down, incur no further labour or expense, as do "grown" Edgings, consequently being much cheaper.

GARDEN VASES, FOUNTAINS, &c., in Artificial Stone, very durable and of superior finish, and in great variety of design. F. ROSHER AND CO., Manufacturers, Upper Ground Street, Blackfriars, S.E.; King's Road, Chelsea, S.W.; Kingsland Road, E. Agents for LOOKER'S PATENT "ACME FRAMES," PLANT COVERS, and PROPAGATING BOXES; also for FOXLEY'S PATENT BEADED GARDEN WALL BRICKS. Illustrated Price Lists free by Post. The Trade supplied.

ORNAMENTAL PAVING TILES, for Conservatories, Halls, Corridors, Balconies, &c., from 3s. per square yard upwards. Pattern Sheet of Plain or more elaborate Designs, with Prices, sent for selection. WHITE GLAZED TILES, for Lining Walls of Dairies, Larders, Kitchen Ranges, Baths, &c. Grooved and other Stable Paving of great durability. Wall Copings, Drain Pipes and Tiles of all kinds. Roofing Tiles in great variety. Slates, Cement, &c. T. ROSHER AND CO., Brick and Tile Merchants. See Addresses above.

SILVER SAND, fine or coarse grain as desired. Price by post per Ton or Truckload, on Wharf in London, or delivered direct from Pits to any Railway Station. Samples of Sand free by post. FLINTS and BRICK BURRS for Rockeries or Ferneries. KENT PEATS or LOAM supplied at lowest rates in any quantities. F. ROSHER AND CO.—Addresses see above. N.B.—Orders promptly executed by Rail or to Wharves. A liberal Discount to the Trade.

Two Gold Medals awarded to us by Royal Horticultural Society, at the

Grand Show at Preston, July, 1878, out of Fourteen Competitors.

Having extensive works, special machinery, and first-class workmen, who have been many years in the trade, we are able to supply the very best class of buildings at an extremely low price. As we are the only firm in the kingdom that has ever been awarded Two Gold Medals by the Royal Horticultural Society, this will be some proof of the quality of our productions. Our buildings are constructed so as to combine great strength, simplicity, and durability, with extreme lightness, and being made of the very best materials, will, with ordinary care, last a lifetime. The ventilators at top and bottom open the whole length with one handle to each series. The glass used is 21-oz. British sheet, and the paint the best genuine white lead and oil. HEATING APPARATUS, with thoroughly reliable Boilers supplied and fixed in the most practical and efficient manner, and guaranteed to work economically and answer its purpose in all seasons. We devote special personal attention to this branch of our business, and have never had a failure.

Plans, Estimates, and Catalogues free. Customers waited on in any part of the Kingdom.

Catalogues Free on application.

**COALS FOR HOTHOUSE PURPOSES.**

**WOOD AND CO.'S**

**STAR ANTHRACITE SMOKELESS STEAM COAL**

is now being extensively used by many of the principal Growers, and is found to be preferable to any other kind of fuel in respect to cheapness and durability, and particularly on account of its being perfectly free from sulphur, and that it does not clinker the fire-bars.

WOOD AND CO. deliver in truckloads to any Railway Station, prices for which can be had on application, or can be delivered by Wood & Co.'s Vans (in the Metropolis).

WOOD AND CO. append a testimonial given to them by Messrs. Beckwith & Sons, a firm of great experience, and who have kindly allowed them to make whatever use of it they may think fit.

Tottenham Nurseries, London, N., Dec. 28, 1877.

To Messrs. Wood & Co.

Dear Sirs,—With reference to your enquiry respecting the "Star" Anthracite Coal with which you supplied us—as to how it suited, its economy or otherwise—we have much pleasure in informing you that in every respect it is the best Anthracite we have ever used. We find there is no smoke from it, which is very essential, and there is no trace of sulphur. It requires very little stoking, and leaves very little ash, and certainly does not clinker. Our consumption of coal is about 500 tons a year, and we have no hesitation in saying that, by using your "Star" Coal in the place of ordinary fuel, we shall effect a saving of at least £100 this year. We attribute this to the powerful and lasting properties of your Coal.—Yours faithfully,

(Signed) G. BECKWITH & SONS.

WOOD AND CO. supply all kinds of Coal for House and Manufacturing purposes, in single truckloads, to any Railway Station, at Wholesale rates, prices for which will be sent on application.

WOOD AND CO., Coal and Coke Factors, Merchants, Contractors to Her Majesty's Government, 58, Coal Exchange, E.C.; and 4, Coal Department, Great Northern Railway, King's Cross, N.; and Midland Sidings, St. Pancras, N.W.; 94, High Street, Kensington; London, Chatham and Dover Railway Coal Depot, Elephant and Castle; and Great Northern Railway Coal Depot, Sydney Road, Hackney Wick, E.

**JONES'S PATENT "DOUBLE L" SADDLE BOILER.**

These Boilers possess all the advantages of the old Saddle Boiler, with the following improvements—viz., the water-space at back and over top of saddle increase the heating surface to such an extent that a "PATENT DOUBLE L SADDLE BOILER" will do about twice the amount of work with the same quantity of fuel; the cost of setting is also considerably reduced, and likewise the space occupied; at the same time these Boilers are simple in construction, and being made of wrought-iron are not liable to crack. They are made of the following sizes:—

Sizes.			To heat of 4-in. Pipe.	Price.
High.	Wide.	Long.	Feet.	£ s. d.
20 in.	18 in.	18 in.	300	7 0 0
20 "	18 "	24 "	400	8 0 0
20 "	18 "	30 "	500	9 0 0
24 "	24 "	24 "	700	12 0 0
24 "	24 "	30 "	850	14 0 0
24 "	24 "	36 "	1000	16 0 0
24 "	24 "	42 "	1400	20 0 0
24 "	24 "	Co "	1800	25 0 0

Larger sizes if required.

From Mr. CHARLES YOUNG, Nurseries, Baltham Hill, S.W., May 29, 1873.

"Having given your Patent 'Double L' Boilers a fair trial at my Nurseries, I beg to say that they are most satisfactory. I consider them the best in use, and without doubt the most economical of all boilers; they will burn the refuse of other tubular boilers I have in work."

PRICE LISTS of HOT-WATER PIPES and CONNECTIONS, with Boilers, of all sizes and shapes; or ESTIMATES for HOT-WATER APPARATUS, erected complete, will be sent on application.

J. JONES AND SONS, Iron Merchants, 6, Bankside, Southwark, London, S.E. When ordering Boilers please refer to the above advertisement.

THE GARDENER.—A Monthly Magazine of Horticulture and Floriculture. Edited by DAVID THOMSON, author of "Handy Book of the Flower-Garden," "Fruit-Culture under Glass," &c., aided by a Staff of Practical Gardeners.

The Gardener during the year 1880 will contain several important Series of Papers on subjects of practical interest. Among others—On the Cultivation of Ornamental Foliage and Flowering Stove Plants—Decorative Greenhouse Plants—Early Forcing and Out-door Culture of Vegetables—Cultivation of Cape Heaths—Ferns—Hardy Herbaceous Plants and Florists' Flowers. The Amateur Flower Garden will have special attention; while Notes from the Gardening Papers, and Notices of New Plants shown in London, will be continued as usual. Occasional Papers on Orchids will be given; and the Editor's Contributions will embrace the important subject of Fruit Forcing; while, in addition, there will be furnished the usual amount of Miscellaneous matter relating to all departments.

The Number for January contains:—The Year 1879, and some of its Lessons.—Stove Plants: No. 1, The Ixora.—On New, Rare, and Choice Ferns.—The Management of Wall Fruit Trees.—Early Vegetables: No. 1.—Cape Heaths: No. 1.—Hints for Amateurs: January.—An Over-wooded Country.—The Early Forcing of Flowers and Fruit.—Notes on Decorative Greenhouse Plants.—The Gardener's Primer, No. VIII.—Root Lifting versus Root Pruning.—The Chrysanthemum as a Florist's Flower.—Bedding Plants.—Scottish Horticultural Association.—Calendar: Kitchen Garden; Forcing Department. Yearly Subscription, free by Post, 7s., payable in advance. WILLIAM BLACKWOOD AND SONS, Edinburgh and London.

WM. PAUL and SON are in WANT of a FOREMAN to take charge of half of their Glass Department (between 20,000 and 30,000 feet), including the Cultivation of Camellias, Vines, Winter Heaths, Miscellaneous Greenhouse Plants, and a few Specimen Roses. A man of character and experience required.—PAUL'S Nurseries, Waltham Cross.

Head Working Gardener.—Married, Without Family WANTED, on February 1, at Chislehurst. Very little glass. Assistant kept. Wages 25s. a week, with free house and gas.—Apply by letter to HOUSE-KEEPER, 2, Gresham Buildings, Easinghall Street, E.C.

HEAD GARDENER will be REQUIRED at Queen's College, Cambridge, on Lady-day next. Salary, £75 per annum, with a house. For further particulars apply personally (if possible) to the Rev. the President.

WANTED a HEAD WORKING GARDENER; married, no children. Must thoroughly understand Grapes, Stove and Greenhouse Plants, and Kitchen-Garden work. None but those with first-class recommendation as to character and ability need apply. Wages 21s. per week with cottage—one labourer kept.—Captain VERNON CARTER, Southwick, Tewkesbury.

WANTED a GARDENER and PORTRESS.—The Board of Management of the Brentwood School District require the services of a Married Couple, without children, as Gardener and Portress, at the District Schools, Brentwood, Essex. Salary, £30 per annum for the Man and £10 per annum for his Wife, with furnished lodge, rations, and washing. The Man must be able to Train the Boys in Practical Gardening.—For particulars of duties apply to the Superintendent of the Schools. Applications must be made upon forms to be obtained at my office, to be returned not later than TUESDAY, Jan. 20 inst., endorsed "Gardener and Portress."

By order, ROBERT CLAY, Acting Clerk. 213, Kingsland Road, London, E., Jan. 2, 1880.

**WANTED, a GARDENER, married, with-** out children preferred. Must have a thorough practical knowledge of Gardening in all its branches, with especial experience in the Treatment of Fruit Trees, Herbaceous and other Hardy Plants. Terms, One Guinea a week and cottage. —**JOHN BUTTEEL**, Pamflete, Ivy Bridge, Devon.

**WANTED, as GARDENER (SINGLE-** HANDED), in a small situation in the suburbs, a skilled Orchid Grower. Age not under 30 nor over 40. Must have at least three or four years' good personal character. —Apply at Messrs. **VEITCH AND SONS**, King's Road, Chelsea, S.W.

**WANTED, a GARDENER, to proceed to** Grahamstown, Cape of Good Hope; a good general Gardener. Good wages given, with or without cottage and rations as may be agreed upon. Free passage by Royal Mail steamer. —Apply to **C. H. HUNTLEY, Esq.**, 80, Ladbroke Grove Road, Notting Hill, W.

**CAN ANY LADY or GENTLEMAN** recommend a good WORKING GARDENER, who understands Vines, &c., with Wife as Laundress. He would have two or three under him. Good cottage in garden. Young family objected to. —**R. L. W., Esq.**, Tyberton Court, Hereford.

**WANTED, a WORKING GARDENER.** —Steady; must especially and thoroughly understand the Growing of Roses, Indoor and Outdoor, also Pelargoniums and other Greenhouse Plants, and he will be required to make himself generally useful about the place. —Address, stating qualifications and wages expected, **W. OWEN**, Silverdale, Oxtou, Cheshire.

**WANTED, a SECOND GARDENER,** married. He must thoroughly understand Inside and Outside Work; a large extent of Glass Forcing carried on. Wages, £1 per week, with house, coals, and milk. Also Two UNDER MEN, wages 10s. and 16s. respectively, and milk found, with vegetables when to spare. —Apply to **J. CARTER**, Gardener, Thurcroft Hall, Rotherham, Yorkshire.

**WANTED, a FOREMAN in a Market** Nursery; one that is practical in Growing Plants for Market, with good testimonials. Must be honest, sober, and industrious. Liberal wages to a suitable man: a constant place. —**J. PERKINS**, Bounds Green Nursery, New Southgate, N.

**WANTED, as IMPROVER in the Houses,** a steady industrious young man: age 18 to 25. Wages to begin with, 15s. per week and Bothy. —**GEO. SMITH**, Gardener, The Street, near Chorley, Lancashire.

**WANTED, an ORDER SEARCHER for** the Herbaceous Department, having some knowledge of Herbaceous and Alpine Plants; a rare opportunity for acquiring a complete knowledge of this class of plants. Applicant must have had experience in the executing of Nurserymen's or Seedsman's orders. Apply, stating age, experience, and salary expected. —**THOMAS S. WARE**, Hale Farm Nurseries, Tottenham, London.

**WANTED, as SHOPMAN, an active** young man, well acquainted with the Seed Trade in all its branches. —Apply with references, and stating salary expected, to **JOHN COWAN**, The Vineyard and Nurseries, Garston.

**WANTED, an active, honest, and experi-** enced Young MAN, in an Agricultural Seed Store, to take charge of Delivery Orders, &c. None but those who have a thorough knowledge of Qualities, Trying Growths, &c. and can furnish the highest testimonials, need apply. State lowest salary. —**G. M., Hurst & Son**, 6, Leadenhall Street, E.C.

**WANTED, immediately, an active,** steady young man, as ASSISTANT in Seed Shop. One who has been accustomed to the Country Trade preferred. —State salary required, age, &c., to **J. WOODS**, Nurseryman and Seedsman, Woodbridge, Suffolk.

**WANTED, a respectable MAN, who under-** stands Buying, for a Florist's; also to make himself useful. —Apply at 91, Piccadilly, London, W.

**WANTED, for the Counting-house, a good** WRITER, accustomed to Invoicing. Salary at the rate of £70 per annum. —Address application with particulars of experience, "B. S.," Barr & Sugden, 12, King Street, Covent Garden, W.C.

**WANT PLACES.**

**TO SANITARY AUTHORITIES.** —**JAS. MYATT**, Market Gardener, is prepared to undertake the Management of a Sewage Farm, and will be happy to treat by letter in the first instance, with the representative of Local Towns. —**JAMES MYATT**, Myland, Colchester.

**TO GENTLEMEN and MARKET** GROWERS. —ADVERTISER is prepared to Work up a Connection, and Establish and Manage a Business for a Gentleman with capital, intending Growing, for Trade purposes only. Grapes, Peaches, Strawberries, Mushrooms, Cucumbers, &c., also choice Cut Blooms. First-class references. —**HORTUS**, 5, Duffield Street, Battersea, S.W.

**GARDENER (HEAD), where two or three** are kept. Thoroughly competent to undertake Vineries or Bedding-out. Good character from late employer. —**J. S., Tadcaster**, Yorkshire.

**GARDENER (HEAD).** —Age 30; can be highly recommended. Reference, Mr. Otley, Daylesford House, Clipping Norton, Oxon. —**C. SPALL**, 11, Mexican Terrace, Caledonian Road, King's Cross, N.

**GARDENER (HEAD).** —Age 33, no family; thoroughly practical. Wife (age 30) good Cook. Good character. —**H. H., 2, Salop Terrace**, Lyham Road, Brixton, London, S.W.

**GARDENER (HEAD).** —**J. SMITH**, Gardener to the Earl of Rosebery, Mentmore, Leighton Buzzard, would be glad to recommend a young man as above, who was employed in the gardens here for over three years. —Address as above.

**GARDENER (HEAD), where three or more** are kept. —Age 35, married; thoroughly practical in all branches of Gardening. —**WM. POLMEAR**, Eohua Lodge, East Barnet, Herts.

**GARDENER (HEAD).** —Married; long practical experience as above, in Forcing Choice Fruits, Flowers, and Vegetables, and general routine of Gardening. —**GARDENER**, 1, Brownswood Terrace, Green Lanes, South Hornsey, N.

**GARDENER (HEAD).** —Age 36; thoroughly experienced in all branches. Understands Stock. Many years' good character. Total Abstainer, and member of Wesleyan Society. —**GARDENER**, Fairseat House, Highgate, London, N.

**GARDENER (HEAD), to any Nobleman or** Gentleman requiring the services of a thorough practical Man. —Age 32, married, no family; well experienced in all branches of the profession, Land and Stock. Wife can Manage Poultry if required. Good character. —**ALPHA**, Hide's, Stationer, New Malden, Surrey.

**GARDENER (HEAD), where others are** kept. Age 44, married, no encumbrance. Has a thorough practical knowledge of the profession; can undertake Lands and Woods if required. Good testimonials. Please state wages, &c. —**S. M., 22, Cambridge Place**, Praed Street, Paddington, London, W.

**GARDENER (HEAD); age 30.** —**W. DAVIDSON**, Gardener to the Earl of Harrowby, Soudon Hall, Stone, Staffordshire, will be pleased to recommend **S. BROWN** to any Lady or Gentleman requiring a thorough practical and energetic man, who has been here as principal Foreman for four years, with credit to himself and to my entire satisfaction.

**GARDENER (HEAD); age 30.** —**Mr. A. YOUNG**, Annesley Park, Nottingham, can with confidence recommend his Foreman to any Lady or Gentleman requiring a thoroughly practical and trustworthy man, who has had the entire Management for the last fifteen months over the whole departments, and the charge of a large staff of men under him, and has given every satisfaction.

**GARDENER (HEAD), to any Lady or Gentle-** man. —Age 35; has had a long and thoroughly practical experience in the Growing of all classes of Fruits, Plants, Flowers, and Vegetables, in every degree of progress. His testimonials prove his worthiness. Eight and a half years' most excellent character from last appointment as Head Gardener. —**N., 10, Crampton Street**, Newington Butts, London, S.E.

**GARDENER (HEAD), or MANAGER.** —A respectable Man, who perfectly understands his Business in all its branches, the Growth of Plants, Grapes, Melons, Cucumbers, Peaches, Mushrooms, &c., and would take charge of Small Farm if required; has long and satisfactory character. Wife could take charge of small Dairy and Poultry. —**J. A. SAVERS**, Chingford, Essex.

**GARDENER (HEAD, or FOREMAN).** —Age 25, married; understands Forcing Peaches, Strawberries, Vines, Orchids, Stove and Greenhouse, and General Gardening. Total abstinence. —**Mr. GARNHAM**, 2, Paradise Place, Ernest Street, Lower Norwood, S.E.

**GARDENER (HEAD, WORKING).** —Age 32, married; has had good experience in the general routine of Gardening in Noblemen's and Gentlemen's establishments. —**M. R., 48, Girdlestone Road**, Upper Holloway, London, N.

**GARDENER (HEAD, WORKING).** —Age 36, married; twenty years' practical experience in all branches, Land and Stock. Good personal character. —**I. A., 20, Harborne Road**, Stoke Newington, N.

**GARDENER (HEAD, WORKING).** —Married, two daughters (youngest six); thoroughly experienced in all branches. Wife good Laundress if required. Three years and six months' good character. —**H. G. W., Addeleston Common**, Surrey.

**GARDENER (HEAD, WORKING), where** two or more are kept. —Age 26; over twelve years' thorough practical experience in all branches; well up in all kinds of Plants, Fruit and Flowers, and General Routine of Gardening. Can be highly recommended. Four years' excellent character from present employer. —**W. E., Messrs. Sutton**, Fareham, Hants.

**GARDENER (HEAD, or SECOND), in a** Gentleman's establishment. —Age 27, single; twelve years' experience. Good character. —**A. B., 2, Nursery Place**, Stoke Newington, London, N.

**GARDENER.** —Temporary employment, three or four months. Charge of Planting, Ground-work, &c. —**J. C. B., Prospect House**, Northend, Batheaston, Bath.

**GARDENER, and LAUNDRESS.** —A Man and Wife wish for a re-engagement. The Man is a good Gardener, and the Wife a thorough Laundress. Good characters. No encumbrance. —**A. E., Terlings Park**, near Harlow, Essex.

**GARDENER (SINGLE-HANDED).** —Age 36, married, no family; thoroughly experienced. —**E., Mason Hill Bank**, Crouch Hill, Upper Holloway, N.

**GARDENER (SECOND), in a Gentleman's** establishment. —Age 27; thoroughly sober and trustworthy. Good character. —**E. S., Mr. Silence**, Lodge Cottage, Fern Bank Road, Ascot, Staines.

**GARDENER (SECOND), or under a good** Foreman. —Age 22; nine years' experience in Houses, Flower and Kitchen Gardening. —**H. P., 73, Cromwell Road**, Redhill, Surrey.

**GARDENER (SECOND).** —Age 26, married, one child; understands Plant and Fruit Growing. Three and a half years in last situation. Good recommendation. —**A. B., Mr. Manktelow**, Northiam, Sussex.

**GARDENER (SECOND, or THIRD).** —Age 18. Good character. —**G. G., 12, Ordinance Road**, Hounslow.

**GARDENER (UNDER).** —Age 22; indoor and out preferred. Seven years' experience. —**H. KING**, 18, Grant Street, Halifax, Yorkshire.

**FOREMAN.** —Age 26; eleven years' practical experience in first-rate places. —**E. C., 9, Mills Buildings**, Knightsbridge, S.W.

**FOREMAN.** —Age 26; has had twelve years' experience in first-class establishments. Can be highly recommended from each place. —**A. Z., The Gardens**, Swithland Hall, Loughborough.

**FOREMAN, in the Houses, in a private** establishment. —**Mr. W. SIMON**, Norman Court, Salisbury, will be pleased to recommend to any Gardener a young man as above.

**FOREMAN, in a good establishment.** —Age 24; has had practical experience with Orchids, Stove Plants, Pines, Vines, Figs, Melons, Cucumbers, Forcing, Pruning, &c. —**FOREMAN**, 9, Ashton Terrace, West Kensington Road, W.

**FOREMAN (INSIDE), in a good private** establishment. —Has had good experience in Plant and Fruit Growing, Early and Late Forcing. First-class references. —**W. WILSON**, Barnet Nurseries, New Road, High Barnet, Herts.

**FOREMAN (or SECOND), in a Nobleman's** or Gentleman's establishment. —Age 25; good references from late employer. —**K. H., 43, Thorhill Place**, Maidstone, Kent.

**NURSERY FOREMAN (GENERAL, OUTDOOR).** —Twelve years' practical experience in leading Nurseries. Good Salesman. First-class references. —**J. K. K., Messrs. Hurst & Son**, Seed Merchants, 6, Leadenhall Street, London, E.C.

**NURSERY FOREMAN, PROPAGATOR, SALESMAN, &c.** —Age 36, married, without family; twenty years entirely in the Trade. First-class references. —**W. B., 10, Tyrrell Road**, East Dulwich, S.E.

**JOURNEYMAN, in a good establishment.** —Age 22; good references from present and previous employers. Both preferred. —**JOHN LISSEY**, Wellhead Gardens, Halifax, Yorkshire.

**To Gardeners.**

**JOURNEYMAN, in a good Garden.** —Age 23; good references. —**A. B., Kempston Grange**, Bedford.

**To the Trade.**

**GROWER, or ASSISTANT.** —Twelve years' experience in Soft-wooded Plants in the Market Trade. —**J. S., 22, North Kent Terrace**, Woolwich, Kent.

**PROPAGATOR and FOREMAN GROWER, or SALESMAN,** or any such-like capacity where the Growth of Plants and Choice Cut Flowers is carried on with spirit. Good Bouquetist, &c. Good experience in Growing Plants and Cut Flowers for the London Markets. Good references, and can be well recommended. —State full particulars to **A. O., Church Walk Nursery**, Stoke Newington, N.

**KINAHAN'S LL WHISKY.** Pure, Mild and Mellow, Delicious and Most Wholesome. Universally recommended by the Profession. The Cream of Old Irish Whiskies.

**KINAHAN'S LL WHISKY.** Dr. Hassall says—"Soft and Mellow, Pure, well Matured, and of very excellent quality."

**KINAHAN'S LL WHISKY.** Gold Medal, Paris Exhibition, 1878; Dublin Exhibition, 1865, the Gold Medal. —**20, Great Titchfield Street**, London, W.

**DINNEFORD'S MAGNESIA.**

The Medical Profession for over Forty Years have approved of this pure solution as the Best Remedy for

**ACIDITY OF THE STOMACH, HEARTBURN, HEADACHE, GOUT, AND INDIGESTION,**

and as the safest Aperient for Delicate Constitutions, Ladies, Children, and Infants.

**DINNEFORD'S MAGNESIA.**

**HOLLOWAY'S PILLS.** —Much watchfulness must be exercised at the present time, and the earliest evidences of ill-health must be immediately checked, or a slight illness may result in a serious malady. Relaxed and Sore Throat, Colds, Quinsy, Coughs, Chronic Coughs, Bronchitis, and most other Pulmonary Affections, will be relieved by rubbing this cooling Ointment to the skin as near as practicable to the seat of mischief. This treatment, so simple and effective, is admirably adapted for the removal of the Diseases during infancy and youth. Old asthmatic invalids will derive marvellous relief from the use of Holloway's remedies, which have brought round many such sufferers, and re-established health after every other means had signally failed.

IMPORTANT CAUTION.—CARTER'S IMPROVED MAGNUM BONUM POTATO.—JAMES CARTER AND CO. find it again necessary to CAUTION the public against purchasing Untrue Potatoes under the above name. This variety was selected from the old Magnum Bonum, purchased in 1877 by Messrs. Carter direct from the raiser, Mr. James Clark, Messrs. Carter find it necessary to issue this caution, as it has come to their knowledge that Potatoes have been sold as Carter's Improved Magnum Bonum, but which were a spurious and very inferior kind. Orders now being looked for delivery in strict rotation. Early orders recommended.

The Queen's Seedsmen, High Holborn, London, W.C.

For prices and particulars apply to The Nurseries, Milton, Stoke-on-Trent.

DICKSONS AND CO., NURSERYMEN and SEEDSMEN, 1, Waterloo Place, Edinburgh, are now looking Orders for the beautiful DOUBLE MATRICARIA, figured in the Gardeners' Chronicle of Dec. 13, 1879, at 1s. 6d. each, 12s. per dozen, or 75s. per 100—all free by post; and are now sending out well-established Plants of their lovely new SAXIFRAGA WALLACEI, at 1s. 6d. each, 12s. per dozen, or 75s. per 100, free by post. Usual discount to the Trade. D. & Co. have the largest stock of BEDDING VIOLAS in the country. Descriptive CATALOGUE free on application.

TREES for AVENUE, PARK, or STREET PLANTING.

ACER DASYCARPUM, 14 to 16 feet, girting 5 to 7 inches. CHESTNUT, Horse, 12 to 14 feet, girting 5 to 7 inches. Horse, 14 to 16 feet, girting 8 to 10 inches. Horse, Scarlet, 10 to 14 feet, girting 6 to 8 inches. LIMES, 14, 15, 16, 18, and 20 feet, girting 6 to 10 inches. PLANES, Occidental, 10 to 12 feet, girting 4 to 5 inches. Occidental, 12 to 14 feet, girting 5 to 6 inches. A few hundred splendid PLANES, 16 to 18 feet, girting 8 to 10 inches. POPULUS CANADENSIS NOVA, 12 to 14 feet, girting 6 inches. MAPLES, Norway, 12 to 16 feet. BEECH, Purple, 10 to 12 feet. OAKS, Scarlet, 10 to 12 feet. CHESTNUTS, Spanish, 10 to 12 feet. SYCAMORE, 12 to 15 feet. They have straight stout clean stems, and handsomely furnished well balanced heads, and from frequently transplanting are splendidly rooted. They are without doubt the finest stock of Avenue Trees to be met with in any Nursery in Europe. The girth of the stems is taken at 4 feet from the ground, and not at the base, which is often deceptive. ANTHONY WATERER, Knap Hill Nursery, Woking, Surrey.

WILLIAM FLETCHER, Ottershaw Nurseries, Chertsey, will be glad to quote prices to the Trade, as named:—

BIRCH, 2 to 3 feet, 3 to 5 feet, and 5 to 8 feet. HAZEL, 2 to 3 1/2 feet. ASH, Common, 2 to 4 feet. ALDER, 2 to 3 feet, 3 to 5 feet. QUICKS, MANETTI STOCKS, &c.

PYRAMIDAL PEAR TREES, in full bearing, from the noted Merriott Nurseries.

No. 1 COLLECTION of 6 best sorts for succession, 10s. 6d. No. 2 " " " 12 " " 21s. No. 3 " " " 18 " " 30s. No. 4 " " " 24 " " 40s. J. GEO. HILL (late Scott), Royal Nurseries, Merriott, Somerset.

To the Trade.

MAGNUM BONUM POTATOS. H. AND F. SHARPE can supply the Trade with a very true stock of the above-named POTATO, grown from carefully selected tubers. It is one of the best disease-resisting varieties in cultivation. Further particulars as to price, &c., may be had on application. Seed Growing Establishment, Wisbech.

Special Offer.

**WEBB'S**  
IMPROVED SCHOOLMASTER  
FIRST PRIZE, BIRMINGHAM  
GROWN BY  
MESSRS G. & J. PERRY

**WEBB'S**  
**IMPROVED SCHOOLMASTER POTATO.**  
(Disease Resisting.)  
This splendid new round variety has become deservedly popular, being the acme of perfection in quality and flavour. It is an immense cropper, producing tubers of large size, uniformly round and handsome, with shallow eyes; flesh, snowy white, and very mealy—undoubtedly the best Potato for table use ever introduced. STOCK LIMITED.  
Price 5s. 6d. per peck of 14 lb., or 20s. per bushel of 56 lb.

**WEBB'S**  
**IMPROVED MAGNUM BONUM POTATO.**  
The Great Disease-Resister.  
This remarkably late Kidney Potato is of grand quality. The tubers are of very large size, symmetrical in shape, with a few small eyes, and of exceedingly fine flavour; the flesh is firm, very white and mealy. It is an enormous cropper on all soils, and fit for use when got up, also an excellent late keeping Potato, as it resists the disease to an extraordinary degree.  
Price 3s. 6d. per peck of 14 lb.; 11s. per bushel of 56 lb.; 30s. per sack of 168 lb. Much cheaper by the half ton or ton.  
WEBB AND SONS being probably the largest growers of Seed Potatoes in the kingdom, can offer other excellent varieties in large quantities on very advantageous terms.  
Potatoes of 20s. value carriage free; 5 per cent. discount for cash.

**WEBB AND SONS,**  
THE QUEEN'S SEEDSMEN, WORDSLEY,  
STOURBRIDGE.

# HOOPER'S CATALOGUE FOR 1880

IS OFFERED TO ALL WHO REQUIRE TO PURCHASE

## SEEDS OF UNDOUBTED QUALITY.

In spite of a season of unprecedented badness, HOOPER & Co. are able to offer Seeds that will grow, and give satisfaction—an end that has been attained only by the most strenuous exertions and unusual diligence. Hooper's Catalogue lays no claim to acceptance on the score of splendour either of covers or interior; it has no coloured pictures to amuse the fancy or to shock the artist; but is a plain and well-stored book of 100 pages, compiled to show what Seeds and Plants they have to offer, and to instruct the reader in all that is necessary about them. H. & Co. do not issue Grand Catalogues to sell, but have good Seeds to sell, and a good Catalogue to give away to all who wish to buy. On the other hand, though unembellished with the gilt and colour of many contemporaries, Hooper's Catalogue is a book which will not disgrace the library table. *Sent Free to all applicants.*

*Hooper's—

and all descriptions of Horticultural Buildings.

LEICESTER RED CELERY has again proved itself to be the hardiest, sweetest, most solid, and best Celery this unfavourable season; when most kinds have been soft and watery this has been good in every way. Those wishing to obtain the true article should have it in printed packets, price 1s.; post-free on receipt of 13 stamps. BROCCOLI, Harrison's new Dwarf Hardy; a late valuable kind, 1s. per packet. SAVOY, Harrison's King Coffee Garden, 1s. per packet. TURNIP, Harrison's Exhibition; a perfect round white variety, from 6d. per packet. CARROT, Harrison's Early Market, 6d. per packet.

HARRISON'S "LEICESTER SEEDS," of choicest quality, are supplied in collections of 25s. and upwards, sent carriage free. Trade Prices and full particulars on application to HARRISON AND SONS, Seed Growers, Leicester.

Westwood Park Late White Broccoli. RICHARD SMITH AND CO. have pleasure in again offering this excellent BROCCOLI, and respectfully solicit early Orders, as the stock this season is limited. Price 1s. 6d. per packet, the usual discount to the Trade. From *The Gardener*, July, 1876:—"The most valuable Broccoli we have seen this year is a kind coming into use in June; it is very white, and of large size before the leaves expand, and though yet in a private garden, we hope to see it comeatable by the public. It is growing in Westwood Gardens, near Droitwich, and Mr. Gough, the gardener, has been saving seed from the finest heads for some years, and has been rewarded with great success." RICHARD SMITH AND CO., Seed Merchants, Worcester.

can only be had direct from  
us, and all packets bear our  
seal.

Price, in sealed packets,  
7s. 6d. per pkt.  
(sufficient for a moderate  
sowing).

CARTER'S  
TELEPHONE.

Awarded a First-class  
Certificate by the Royal  
Horticultural Society.

"Carter's Telephone is  
the best Pea I have had in  
the garden, bearing large  
semi-double pods, well filled,  
and of excellent flavour."—  
Mr. RABONE, *Gardener to*  
*the Right Hon. the Earl of*  
*Shrewsbury.*

Price, in sealed packets,  
3s. 6d. per pkt.

TELEGRAPH  
(CULVERWELL).

"Culverwell's Telegraph  
Pea is the longest and hand-  
somest Pea grown, very  
productive, and excellent  
quality."—Mr. GOODACRE,  
*Gardener to the Right Hon.*  
*the Earl of Harrington.*

Price, in sealed packets,  
3s. 6d. per pkt.

CARTER'S  
LITTLE WONDER.

"I never saw such a  
heavy crop of Peas as I had  
on your Little Wonder; it  
is first-rate in flavour and  
colour."—Mr. NORMAN,  
*Gardener to the Right Hon.*  
*the Marquis of Salisbury,*  
*K.G., 1879.*

Price, in sealed packets,  
3s. 6d. per pkt.

"CARTER'S STRATAGEM is a re-  
markably fine New Pea, much in ad-  
vance of any other dwarf variety—for  
size of pods and Peas unsurpassed by

GARDEN and FLOWER SEEDS.

THOMAS METHVEN & SONS

Beg to intimate that their Descriptive Priced CATALOGUE of KITCHEN GARDEN and  
FLOWER SEEDS, IMPLEMENTS, FRENCH HYBRID GLADIOLI, &c., for 1880, is now  
ready, and may be had, post-free, on application.

**EAST LOTHIAN INTERMEDIATE STOCK** (true), White, Purple, Scarlet, and White Wall-leaved.  
In packets, 1s., 2s. 6d., and 5s. each colour.

**NEW CRIMSON EAST LOTHIAN INTERMEDIATE STOCK.** A splendid Novelty. In  
packets, 1s., 2s. 6d., and 5s. each.

**GODETIA WHITNEYI RUBRA.** An improvement on G. LADY ALBEMARLE. Per packet, 1s. 6d.

**MELON, CAPTAIN BURNABY.** Raised from seed sent home from Khiva. Received First-class  
Certificate from Royal Caledonian Horticultural Society in October last. Per packet, 2s. 6d.

*For Descriptions see Catalogue.*

AND NURSERY GATE, LEITH WALK, EDINBURGH.

TO THE TRADE.

SEED POTATOS.

H. & F. SHARPE

Invite the attention of the Trade to their Special PRICED LIST of  
SEED POTATOS, issued last November,

*Which comprises, amongst many others, the following excellent  
varieties, viz. :—*

**PRIDE OF ONTARIO** (New),  
RIVERS' ROYAL ASHLEAF,  
MYATT'S PROLIFIC ASHLEAF,  
**MONARCH KIDNEY** (New),  
AMERICAN EARLY ROSE,  
BRESEE'S PROLIFIC,

**MAGNUM BONUM**,  
CHAMPION,  
ELLIOTT'S WONDER,  
SNOWFLAKE,  
BRESEE'S PEERLESS,  
BRESEE'S KING OF THE EARLIES.

The above have been Grown from the Finest Selected Stocks, are of Splendid Quality,  
and Free from Disease.

SEED GROWING ESTABLISHMENT,  
WISBECH.

SEEDS OF SUPERIOR QUALITY.

WM. PAUL & SON

(Successors to the late A. PAUL & SON—Established, 1806)

BEG TO ANNOUNCE THAT THEIR

ILLUSTRATED CATALOGUE OF SELECT VEGETABLE,  
FLOWER SEEDS, &c.,

is now Ready, and will be forwarded Post-free on application. Many Seeds are home-grown,  
and all are selected with the utmost care, from the most celebrated stocks at home and abroad,  
in order to secure their Customers the best quality that can be obtained.

Important.—Observe Christian Name—

SPRING, SUMMER, AND  
WINTER BEDDING.

NOTWITHSTANDING all the sarcastic  
abuse and denunciation that has been,  
and is still being, said and written against  
summer bedding, there is yet no diminution  
of it, but rather a growth, happily in an im-  
proved form, by the more free use of foliage  
plants, both as masses and as single specimens.  
By their means the gaudiness and monotony,  
for years so prevalent, have been relieved;  
but there is yet room for further improvement,  
more particularly in the way of a more general  
use of hardy plants. And once this is accom-  
plished, the objectors to the system will have  
little ground on which to found their objection,  
seeing that if they have not the desired "Pars-  
ley-bed" on which to relieve their eyes, they  
have other and more graceful plants; and the  
hardy plants would remain all the year round—  
thus meeting other objections, viz., the transitory  
nature of summer-bedding, the long season of  
bare beds, and the immense labour involved in  
wintering and getting up a stock of tender  
plants. It is with a view of assisting to  
bring about such a desirable result that I now  
advocate the increased use of hardy plants, so  
that in the autumn, as soon as frost seems immi-  
nent, and the tender bedders must be removed,  
they may be so few, that, with a little supple-  
mentary planting, the beds shall be effective,  
if not gay, during the whole of the winter and  
spring months.

That an effective winter bedding arrangement  
is possible, none will doubt who saw the Messrs.  
Lee's exhibit at South Kensington in October  
last, and as practised in some few private  
gardens. Spring bedding is more than well  
done in many places, but how to combine the  
three—spring, summer, and winter—to get a  
maximum of effectiveness at all seasons by a  
minimum of labour, is a difficult problem. I  
think, however, that it can be solved—indeed,  
it is being solved; and though it may take years  
to complete the solution, the incentives to  
grapple with it are very great. During the last  
fifteen or twenty years there have been intro-  
duced, principally from Japan, a large number  
of small slow and compact growing shrubs, of  
almost every hue from dark purple to bright  
yellow, nearly all of them suitable for the  
adornment of the parterre, as they harmonise  
well with all kinds of bedding plants, and can  
be transplanted at any season with safety.  
They are in full beauty the whole year round,  
and are about the most effective "dot" plants  
that can be found for a groundwork of any variety  
of bedding plants: I allude more particularly to  
the Retinosporas, though there are other kinds  
of almost equal merit, particularly the smaller  
growing Thujas, the variegated Euonymus and  
Yuccas. It is to plants of this character that we  
must pay greater attention, by using them—if  
I may be allowed the expression—as permanent

bedding plants. Other hardy all-the-year-round plants, well suited for lines or groundworks, are found in *Ajuga reptans rubra*, *Arabis lucida variegata*, *Antennaria tomentosa*, *Cerastium tomentosum*, *Pyrethrum Golden Feather*, *Santolina incana*, *Festuca glauca*, *F. viridis*, and various well known *Sedums*, *Saxifrages*, and *Thymes*. These two sets of plants, with others of like nature, will as it were form the framework of the beds the entire year, and the rule or guide that should be observed in planting them should be to use them as largely as possible, but so to dispose them in the most varied arrangements that their repetition be not observable.

The summer filling in, and the most suitable plants for that purpose, will be understood by all, and when frost necessitates the removal of these the spaces may be effectively filled for the winter with small shrubs, the following being some of the best kinds for the purpose:—*Cotoneaster microphylla*, variegated lilies, variegated *Periwinkles*, *Mahonia Aquifolium*, *Laurustinus*, small variegated *Aucubas*, *Portugal Laurels*, *Pernettyas*, *Osmanthus*, &c. Plants of this class will produce the best winter effect, but should spring effect be that most desired then the following will be best to take the place of the summer bedders:—*Hardy Heaths*, especially *Erica herbacea*, *E. mediterranea*, *E. carnea*, and *E. rubra*; *Alyssum saxatile*, *Aubrietia Campbellii*, *Daisies*, *Pansies*, *Myosotis*, *Primroses*, *Crocus*, *Narcissus*, *Tulips*, *Hyacinths*, and many others—only that when bulbs are used the ground should be carpeted for the winter with *Sedums* or some other neat surface-rooting plant. Such a furnishing of the bare soil, whilst it enhances considerably the winter appearance, is in no way detrimental to the growth of the bulbs.

Such a system of bedding as I have here sketched out necessarily implies the removal of the whole of the plants once each year for the purpose of renovation of the soil and working out fresh designs. It also necessitates a reserve garden, where the shrubs can be transferred till required, and division and propagation of spring plants be done during the summer season. All this, of course, involves labour, but if accounts were balanced I have no doubt that the verdict would be all-the-year-round effectiveness and less labour than that now required to produce with tender plants at the most sixteen weeks of summer beauty.

But some may ask—do ask—Why advocate bedding-out at all? Is there not a sufficiency of hardy plants and flowers to keep our gardens cheerful without having recourse to such artificiality? To such I answer—1. That as servants we are required to please our employers, many of whom demand that bedding-out shall be a speciality. 2. Bedding-out, or formal planting, is the only style adapted to all geometrical-form gardens, surrounded with statuary, vases, &c., and till these become extinct the formal planting of gardens will continue. Moreover, the major part of flowering, herbaceous, and other hardy flowering plants, are not suitable for such planting; so that, much as some of us would like that there should be an end to the system, obviously our wish is not yet likely to be gratified; and it therefore behoves us, not to vent our abuse on what we are unable to alter, but to make the best of it, though it may be “a bad bargain,” by doing our utmost to lessen the labour it entails by using all the hardy plants available, that the parterre may be gay the whole year round. *H. Wildsmith, Heckfield Gardens, Winchfield.*

THE ABYSSINIAN BANANA.—A magnificent specimen of the noble *Musa Ensete* is at present in flower at Mentmore, Bucks, where it forms a most striking object in the large temperate-house.

## New Garden Plants.

### BARKERIA CYCLOTELLA.\*

This plant has cost me much trouble. Once more a miserably short winter's day was spent in looking over all my materials; and now I think myself entitled to establish this as a new species. It stands just between *Barkeria Lindleyana* and *B. melanocaulon*, having the characters of the keels of the first and in the shape of the lip coming nearer the second. One might even surmise it to be a mule between the two.

*Barkeria Lindleyana* (and the variety *Centrae*, of course) is easily recognised by the oblong square lip, the middle keel ceasing at a distance from the apex of the lip, while the lateral keels are much shorter. The anterior part of the lip is of a beautiful dark purple. The column has dark spots. I had the other day a splendid plant of it, kindly sent by Mr. Backhouse, of Holgate House, York. Herr Consul Kienast sent me dried specimens, quite of late prepared (and of course ruined) by the application of hot iron by the Indians. Thus do the mistakes of civilisation spread! No doubt the same natives made the pencil sketch—a great proof of unusual talent, though, by an extravagant liberty, the keen artists drew in one of the flowers the column outside and underneath the lip, which, if really found in Nature, would alarm all the morphologists of the globe. The colours are very fine, and quite worthy of the excellent Dr. Lindley, to whom the species was dedicated by Mr. Bateman.

*Barkeria melanocaulon* has a lip that is broader at the base than at the top, where it is generally emarginate. The side borders are crenulate and very distinctly undulate, the middle keel just ceasing at the very tip of the lip. The column is green in the middle of the back, whitish at the sides over the very prominent wings, and covered with small dark stripes (not spots). From sketches I made from living specimens I see it folds down on each side of the lip, so as to look finally

FIG. 15.—BARKERIA CYCLOTELLA.

like an old-fashioned military cocked hat, as they were worn in the old times, and such as are even now to be seen with the Italian Carabinieri. As far as my remembrance reaches, the whole flower is light rosy, with the exception of the column, and there is no dark blotch on the top of the lip. Biologically this is quite distinct from all other species, since gardeners have the greatest difficulty in killing this—a quality one misses in the other species. In 1844 we had at Dresden fresh plants sent by Galeotti himself, and its descendants lived till 1870. It is a long time since I have seen fresh flowers, but I have twenty-three herbarium specimens at hand, which give me a very satisfactory idea of the species combined with my sketches and notes.

Now *Barkeria cyclotella* has a lovely inflorescence: the flowers are near those of *B. Lindleyana*, with the same keels, but the lip has neither the square outline of that species, nor has it the form and undulation of *Barkeria melanocaulon*, but it has its broadest transverse diameter through the centre, and there are no enulations. The column has neither blotches nor lines; it is purple on the hinder surface near the top, whitish at the sides and in front. The colour is wholly that of a good “*Barkeria Skinneri*” (*Epidendrum Skinneri* of Lindley, but it sells much better as a *Barkeria*, though, scientifically, *Barkeria* is nothing but *Epidendrum*). Add to this, that the anterior part of the lip is nicely adorned by a dark purple spot as in *B. Lindleyana*. This appears never to be the case in *B. melanocaulon*.

Thus this novel *Barkeria* is a lovely thing. I made its first acquaintance by a single flower, kindly sent me by Mr. Bull (No. 413). I called

\* *Barkeria cyclotella*, n. sp.—Racemosa, bracteis triangulis scariosis ovarius pedicellatis quinque brevioribus; sepalis triangulis acuminatis; tepalis ovatis acutis, labello supra basin columnæ adnato, basi leviter cordato, ceterum plus minus circulari, integerrimo, plano, carinis a callis depressis basos exarantibus bene ante apicem abruptis, vulgo obscuris; columnæ apice utriusque apiculata, alis semioblongis, haud conspicuis.—Colores *Barkerie Lindleyana*, sed columna immaculata. (Vidi specimen a cel. Bull et Day.)—*Epidendrum cyclotella*, H. G. Rehb. f.

it reluctantly *B. Lindleyana*, but wrote to my indefatigable correspondent that my conscience was not easy about the name. How can one expect a botanist to have an easy conscience after the “homeopathic dose of a single flower”? Now, my second oldest English correspondent, who has been so very often my helpmate and my teacher, having had a hint of my feeling uncomfortable in this *Barkeria* question, immediately sent me a complete inflorescence, nice and fresh. If there do not appear new and unexpected difficulties, as is so often the case in venturing upon knowledge of plants, I would regard the question settled. I have, however, some reason to guess that one of these days some critical plant may come from Mr. Backhouse, which may require us to re-open the question. *H. G. Rehb. f.*

### ODONTOGLOSSUM EDUARDI, Rehb. f.

When I named this on July 4, 1878, I did not hope to see it so soon in flower. I have a panicle at hand with sixteen flowers, coming from a bulb a third smaller than the wild bulb. Now this pretty inflorescence is quite a poor dwarf when compared to the giant specimens in my herbarium, gathered by the discoverer, Mr. Edward Klaboch. The flowers make one-third of those of *Oncidium ornithorrhynchum*, yet they are larger, and the lip is rather triangular. Their colour is mauve, with a light purple hue. The lip is not totally yellow, as had been stated, but of same colour, with only the callus ochre-coloured, and if you look carefully you will see a small narrow zone of light sulphur surrounding the anterior part of callus. I do not recognise in the fresh flowers such asperities outside the sepals as I have described them in the dried flowers. The callus is subject to several variations. It is oblong square, both sides going out in lobed keels, and an obscure ridge running through the middle. It appears sometimes that a square blade rises at its apex, and sometimes there is an obscure callus each side. I did not find any more in the fresh flowers, the lateral keels being forcipate, as I saw in a dried flower. It has just flowered with Mr. H. J. Buchan, Wilton House, Southampton. A First-class Certificate was awarded to this gay novelty by the Royal Horticultural Society last December 16 (see our columns, p. 787). No doubt Mr. Edward Klaboch will feel pleased, when reading this statement in some little known posada of some distant valley in the Andes. I have to thank for the specimen Mr. Arthur Veitch, who was delighted with the delicious perfume. *H. G. Rehb. f.*

### DENDROBIUM AUREUM (Lindl.) PHILIPPINENSE, n. var.

This is a stately variety, with much taller bulbs than those of the Indo-continental form. It has larger flowers of a very pallid colour. The lip is far more acute, as are also the sepals. It has a single broad purple blotch under the velvety disk. On both sides of the base stand orange areas. It comes very near the *Dendrobium heterocarpum* Henshalli of *Bot. Mag.*, 4970, which has shorter bulbs and two dark blotches on the lip. It is well known that *D. aureum*, Lindl., and *heterocarpum*, Wall., are the same.

Just as *Cattleya labiata*, *Dendrobium aureum*, Lindl., is an exceedingly polymorphous species—to speak with Engler, in his monograph of *Saxifraga*, it is “*typus polymorphus*.” This species is exceedingly variable, as my numerous specimens from Ceylon, Moulmein, Khasia Hills, Minahassa, Philippines, give evidence as well as my very copious garden specimens. If somebody compares the various good English representations (also of *D. rhombum* and *aureum pallidum*) he will have an idea of the variations. Dr. Wight's plate, 1646, is a most indifferent representation. Those cheap Indian artists are very dangerous in their thoughtless, mechanical work.

I have had this variety at various times from Messrs. Low, Veitch, and Bull, and now it flowers once more with Messrs. Veitch [and with Mr. Thomas Christy]. *H. G. Rehb. f.*

## NEW HYACINTHS OF 1879.

THE thistle's song in April, so clear, sweet, and inspiring, has been denominated “the first redresser of the winter's wrong.” Its hopeful song, so full of joyous life, is heard in the early days of the month, and with it there are many precocious flowers gilding the fields and hedgerows, full of gladness beauty in the invigorating rays of the sun. Ravishingly welcome as all this beauty is, it is but a gleam of the full flow of the light of floral life seen under glass when Spring, coming victorious from its tussle with and overthrow of Winter, leads forth numberless beautiful flowers as earnest of its triumph.

This thought was deeply impressed on my mind as, one sunny day in April last, I went into one of the span-roofed plant-houses in Messrs. Veitch & Sons' nursery at Chelsea, and saw there something like one

hundred plants of the newest Hyacinths of the season, including a few plants of each variety, making up a collection of novelties of unparalleled extent and remarkable beauty and quality. How actively at work the Dutch growers must be to produce in one small epoch of horticultural time so much of transcendent worth! When not less than eleven First-class Certificates of merit are awarded to new Hyacinths in one season, there must needs be something particularly fine and striking among them. Let us pass in review a few of the autocrats of this floral assembly, and note their characteristics.

Of blue-flowered varieties the doubles were represented by Duke of Norfolk, rich deep purple, almost a claret-purple, good bells, and fine close spike—a good and useful addition to this class; and Frans Hals, deep purple with dashes of bright blue—a variety that in all probability will require good culture to bring it to perfection. Of pale blue single flowers Duchess of Connaught took the lead; the surface of the segments delicate silvery-lilac, with a fine pale blue reverse, excellent form, and very fine handsome spike. Pottgieter, of a very delicate tint of grey-blue, with a bright pale blue reverse; distinct and very pretty. Lord Beaconsfield, bright pale blue reverse to the segments, with a delicate tint of lilac-blue on the surface; large and massive bells, of fine form; very fine spike, extra extra. John Bright, somewhat rough in the spike, a defect that may disappear with cultivation; the segments delicate blue on the face, with a good deal of pale bright blue on the reverse: this will most likely make a good Hyacinth; and Pauline Lucca, a very distinct flower, the reverse of the bells blue, with a deep tint of lilac-blue on the face, the segments margined with silvery-grey; very fine, and of excellent quality. The blues of a darker shade were—Masterpiece, black margined with deep purple, very dense symmetrical spike, and one of the finest new Hyacinths of the year. Duke of Connaught, more of purple and less of black, was characteristic of this variety as compared with the foregoing; great depth of a rich shade of a blue-purple colour; good bells, fine close spike; a rich looking and showy variety. Royal Blue, a variety with large and well-formed bells, the segments having dark stripes down the centre, with bright purple margins; a fine, distinct, and promising flower; and Ainsworth, dark purple segments edged with a brighter hue; rather rough, but with plenty of stuff in it to make a good Hyacinth.

In the class of red flowers King of the Reds stood out from all the rest for its strikingly rich and glowing hue of colour; deep bright lake, with a light centre to the bells, the latter of excellent form, and very fine close spike. Vurbaak and other fine reels looked pale by the side of this. Delicata, a bright deep red, an improved Lina, very good spike, and small well-formed bells; a pleasing flower of good quality. Lord Derby, the centre of the bells marked with a deep stripe of red, the margins delicate flesh; fine long showy spike, plenty of bells, the segments narrow; but, as in the case of the white Seraphine, they are so numerous as to form a symmetrical spike. Trocerado, pale pink, with stripes of deep rose; a very fine pleasing variety; excellent bells and spike, combined with a good habit of growth. Loveliness, blush ground with deep pink stripes along the segments and across their tips; very fine spike, a strikingly delicate flower, and most appropriately named. Romeo, rosy-lake, with a broad stripe of colour along the segments and pale margins; good close spike. Salmon King, an almost semi-double variety, delicate salmon-pink, with a stripe of deeper salmon-pink along the segments, this colour deeper still on the reverse; very large massive bells, and grand spike: extra fine. Leviathan, flesh-colour, and flushed and delicately striped with pink; very delicate and chaste, and extra fine quality.

Of white varieties there was a most promising double under the name of The Bride. This was a really pure white double Hyacinth; large handsome bells, and fine spike. Of single varieties there were Galatea, French-white, with very slight stripes of the most delicate lilac only just perceptible; very distinct in colour, and fine close spike. L'Ornement des Roses, almost a yellow; white, with very slight buff stripes along the segments; fine bold-looking bells; and Catherine Hermina, a wonderfully pretty Hyacinth, a kind of refined La Grandesse: if the spike will but lengthen and become more massive with cultivation, it will make a rare white Hyacinth.

Of new yellow varieties there were Kenan Hasse-

laar, of which it may be said that if the dash of yellow on the reverse was on the face of the segments, it would be grand in colour; rare close spike, and suggestive of getting near perfection as a yellow save in wanting greater depth of colour. McMahon, in the same way, but wanting the massiveness of texture and form. Canary Bird, also a good yellow, but below the first-named in point of quality. Obelisk, also wanting in massiveness. Lord Derby, pale buff yellow with dashes of pink in the tube; distinct in colour, and may improve with cultivation. Lastly Brutus, like Duc de Malakoff, but with less of red on the segments.

Two claret-coloured varieties must be mentioned—viz., The Shah, having pale wine-purple segments with dark stripes, forming a dense spike—a fine bright-looking Hyacinth; and The Sultan, claret and magenta, with bright purple dashes—a bold and showy Hyacinth; excellent spike.

With so much wealth of form, and such varied flushing of hues, with their distinct and novel tints and shades, there is no lack of new Hyacinths; but when they will be put into commerce is a matter which cannot now be rightly determined. *R. D.*

### JAPANESE CHRYSANTHEMUMS: THE CHUSAN DAISY.

HAVING given a list of the names of plants discovered and introduced by me from China and Japan (see p. 11), I now propose to make some remarks upon some of the species. And, first, I shall take the Chrysanthemum named by me the "Chusan Daisy." This was found in a cottage garden on the Island of Chusan, and sent home to the Horticultural Society of London. I well remember writing a letter to the late Dr. Lindley, who was then Secretary, telling him not to despise the modest little flower, as it was probable that great things might be done with it in hybridising independently of its being a very pretty little plant. It reached England alive, but for a time did not attract much attention.

About this time the late Mr. Salter, of Hammersmith, had settled in Versailles, where he was making the culture of the Chrysanthemum a speciality. In his book published a few years ago he thus speaks of the "Chusan Daisy":—"In 1846 a new era commenced in the history of the Chrysanthemum, for at that time Mr. Fortune brought from China two small flowering varieties known as the 'Chusan Daisy' and 'Chinese Minimum.' Although Mr. Fortune admired them in Chusan they were considered too small and insignificant for English taste. The French opinion of them, however, was far different, for immediately upon their introduction in 1847 into the already well-known collection at Versailles the little 'Chusan Daisy' became a favourite. From these two varieties have sprung all the Pompons now in cultivation." So much for the "Chusan Daisy" and for the effect it has produced in the history of the Chrysanthemum.

At that time the Chrysanthemums in England were far superior to those of China. I could find nothing worthy of being introduced except those small varieties already mentioned. A few years afterwards, however, in 1866 and 1867, on visiting Japan I found myself in the very home of the Chrysanthemum. Here not only was the culture far superior to anything met with in England, but the varieties were altogether different. In so far as the culture was concerned, the Japanese were greatly assisted by their climate. What a glorious autumn they have in Japan! The sun shines from morning to evening in a clear sky, with scarcely a cloud to obscure his rays.

The place most famed for its Chrysanthemums in the vicinity of Yeddo is Ah-sax-san. At the time of my visit the Chrysanthemums were in full bloom, and most certainly would have delighted our English florists had they found themselves so far away from Hammersmith, the Temple, or Stoke Newington. I procured some extraordinary varieties, most peculiar in form and colouring, and quite different from anything of the kind at that time known in Europe, and luckily they reached England alive. I observe the following notice in my diary at the time:—"If I can succeed in introducing these varieties into Europe, they may create as great a change amongst Chrysanthemums as my old *protégé* the modest 'Chusan Daisy' did when she became the parent of the present race of Pompons."

In Mr. Salter's book noticed above he has the following notice:—"In 1862 Mr. Fortune introduced

several Japanese varieties, some of which were spotted and striped; others were of fantastic forms called Dragons, and one, laciniatum, was a beautifully fringed white flower, most invaluable for bouquets, having the appearance of a Japanese Pink rather than of a Chrysanthemum." From my journal I quote the following description of these plants:—"One had petals like long thick hairs, of a red colour, but tipped with yellow, looking like the fringe of a shawl or curtain; another had broad white petals, striped with red, like a Carnation or Camellia, whilst others were remarkable for their great size and brilliant colouring."

On the first introduction of these plants they were not appreciated by the florists of this country. But the effect they produced in our greenhouses and conservatories was most charming, and they were highly prized by the public and by artists. At last the opinions of our florists seem to have changed, and the Japanese Chrysanthemums are, I think, generally appreciated.

There is one curious circumstance about these plants which I must not omit to mention. Of course there were many varieties that I did not succeed in introducing; but, strange to say, many of these varieties were raised afterwards by Mr. Salter at Hammersmith from those I had introduced. An old lady who lived near me in Kanagawa used to point to a number of varieties in her garden, and say that they all came from one and the same plant. I had the experience of Mr. Salter, and knew this was not unlikely. I think she was rather surprised when I said I fully believed her. *Robert Fortune.*

### TOMATOS ALL THE YEAR ROUND.

NOT many years ago Tomatos were grown only from seeds sown in the spring, just in time to have plants ready for planting out against a south wall early in June. As the seeds germinate quickly and the plants grow rapidly, a few weeks sufficed to have fine plants grown and fairly hardened off for planting out at the desired time, and with this meagre attention good crops have been produced year after year up to a recent period. The appearance of the Tomato disease and the change that has taken place in our seasons (the former I verily believe being the direct result of the latter) has aroused cultivators to a true sense of their position with regard to the cultivation of this esteemed edible. A good aspect in which to plant out the plants early in the summer, and keeping the shoots thinned out and regularly stopped after each successive bunch of fruit was formed, was about the sum total of the labour expended upon Tomato culture so long as the use of the vegetable was confined to the few families who possess walled-in gardens and a staff of competent gardeners. Now, however, things have changed; the vegetable has become, or is fast becoming, a public commodity, and a good many find it pays to grow whole houses of them, and no sooner is this move noticed by private gardeners than they at once take another step to the front by forcing Tomatos in winter, leaving the middle classes to fall back upon American produce, which is sadly inferior to what is grown in private gardens.

It is one of the best paying crops that can be grown, and no doubt when this fact is discovered by the enterprising portion of those whose interest it is to keep in advance of the times the market will become better stocked with English-grown Tomatos at a much lower price than good samples are at present sold. A good sample of Tomatos is now sold at a proportionately higher price than an inferior one, much after the manner that finely finished black Grapes take precedence of brown ones; indeed form, colour and size are the distinctive marks of public appreciation in this as in other branches of either fruit or vegetable trade. This being so there is little doubt that before long Tomatos in winter will be as much sought after as Asparagus, Seakale, and other choice winter esculents.

There is nothing to bar the extension of this rapidly increasing branch of vegetable cultivation "all the year round," providing proper steps be taken at the commencement. It is a difficult matter to obtain through the medium of a seedsman a variety of Tomato that is worth growing in winter. You order two or more varieties that are highly spoken of in public—you sow the seed, grow the plants, and tend them up to the bearing period, only to find that half or more of

your "nurslings" are what are vulgarly termed "mongrels."

It was a disappointment of this kind that first induced me to seek a remedy for myself, by selecting a good strain of seed, and maintaining, if not improving, its character by annual selection. You have no chance at an exhibition with such crack exhibitors as Mr. Miles, of Wycombe Abbey, unless you have a stock of something far beyond mediocrity to appear in public with; and these remarks hold equally good in the matter of market competition, where the good article brings the correspondingly high price. The month of February is early enough to make the first sowing, in a pot or pan of rich mould according to the number of plants required.

The details of cultivation are so well understood, that it is hardly necessary to particularise except with reference to plants that are intended for special purposes. Those who intend growing for exhibition early in the season, cannot do better than time their plants as nearly as possible to come into bearing about the date the exhibition takes place. The first fruits are invariably the best. An average of three months will not be far wide of the mark to allow from the time the seed is sown until the first fruits are ready for gathering. In the early stages of growth plants intended to bear show fruit should be grown "stubby" and vigorous by keeping them near the glass, well ventilated, and in a moderately dry, not over high atmosphere. They may also with advantage be kept in small pots, say from 6 to 7 inches in diameter, until they show flower and set their first batch of fruits if time is a consideration.

Once the plants get into a bearing state over-luxuriance is counteracted, and a fair balance is struck between root and branch. The plants may then be shifted on into pots 10 or 12 inches in diameter, and stout stakes put to each plant to keep them from vibrating, or if there is room for them to stand along the back wall of ainery they will succeed perfectly in pots from 7 to 9 inches in diameter, allowing them to root into some rich preparation, which should be placed underneath them, and feeding them as their condition will indicate with liquid manure. The plants should be stopped regularly above the flowers as they appear, and of course all superfluous growths and side-shoots are removed in order that the energies of the plants may be directed to the swelling and development of the fruit. With regard to size and colour the former is secured by thinning the fruits, and the latter by exposure to sun and air. As far, however, as exhibiting is concerned, form and colour are indispensable, size being a secondary consideration. Plants required for fruiting in winter should be propagated from cuttings in August and early in September, earlier or later according to locality, by inserting cuttings in small pots, or by potting half-a-dozen cuttings in a 6-inch pot and plunging them in a moderate bottom-heat of from 65° to 70°. After the plants are potted off the same remarks that are applicable to early spring cultivation are equally applicable in winter, with this difference, that they must be grown in a lower and drier temperature as light decreases and the natural condition, instead of improving daily, as is the case in spring, is operating in an opposite direction.

For winter work the back wall of a light airy lean-to house where other forcing is being carried on answers admirably. Shade and moisture are elements that are always inimical to the welfare of rapid-growing subjects, and especially at the flowering stage moisture must be cautiously dispensed, otherwise the plants will fail to set their fruits; although once set the swelling process may be materially hastened by its application, and a corresponding rise of temperature up to the ripening stage, when more air and a drier heat will be required. It strikes me that in future Strawberries and Tomatos will be grown side by side for winter more than they have been; both are useful winter crops, and both hold a high place in public estimation in their respective departments.

*CYPRIPEDIUM SPICERIANUM.*—We understand that this *Cypridium*, which was illustrated in our last issue, was received from India some time ago by Mr. Spicer among a mixed collection of Orchids without any indication whatever as to its habitat. When it flowered for the first time a bloom was sent to Professor Reichenbach, who named the plant in compliment to the gentleman through whose instrumentality it was introduced to British gardens, and from whom Messrs. James Veitch & Sons purchased the stock.

## CLOVER AND GRASS SEED.

THE extent of the import and export trade in grass and Clover seeds done by some of our larger London wholesale seed houses is of such an extent, and includes such enormous bulks, as to be absolutely astonishing to those unacquainted with the immense supplies received and distributed. The bulks of natural and perennial and Italian Rye grasses, for instance, are of such an extensive character, including of course the finer mixtures for lawns, croquet and cricket grounds, &c., as to supply statistics of a very interesting economical and commercial character. If it were attempted to give the quantities of seeds passing through some of the warehouses in a year, the figures might be taken as something incredible, though they would be perfectly true nevertheless. The visitor privileged to walk through the spacious floors of the warehouses, towering one above the other to the extent of seven or eight storeys, finds himself at this season of the year hemmed in with piles of bales of grasses and Clovers of alarming height and extent; and the first question that arises in his mind is, "From whence are all these enormous supplies drawn?" We are in a position to give a reply to this question.

All natural grasses are obtained from Germany, from the districts on the banks of the Rhine, the vicinity of Darmstadt, and others where the cultivation of these is largely pursued. Holland has commenced to furnish its quota, and it will be found that, when favoured with good harvests, the Dutchmen will furnish these in larger quantities year after year. Timothy-grass, a valuable grass either for hay or green food, and Alsike Clover, which when mixed with grass is good for permanent pasture or mowing, come from Sweden; and the latter is said to have obtained its name from growing in abundance in the parish of Alsike, in Upland. Red Clover in varieties, white Clovers and Alsike also, are largely drawn from Germany and Austria. Lucerne, which on account of its tap-root succeeds better than the red Clover because of its ability to survive the effects of drought, and Sainfoin, as representing other foliage plants for feeding, mainly come from France, and so do great quantities of Italian Rye-grass. Large quantities of Timothy-grass and red Clover come from the United States of America, and Canada, and some white Clover and Alsike also. It is from Scotland and Ireland that the perennial Rye-grasses are obtained. This list gives a general idea of the main sources from whence these valuable supplies are drawn.

Where do they go to? is a matter of equal interest and importance. Large portions are consumed at home, and enormous quantities go abroad. The shipping trade, which is done to an extent that would savour of the romantic were its details set forth in the form of statistics, is replete with interest. Extensive shipments are made to Australia, New Zealand, California, Canada, and the United States; smaller but increasing supplies go to the Cape of Good Hope and Natal. Clovers and natural grasses are used extensively in Australia and New Zealand. The landholders in these latter countries appear to be fully alive to the necessity and importance of providing rich, healthy, and nourishing grasslands. In this respect they appear to betray a greater anxiety than do many of our English farmers. Of late years, in these colonies, large tracts of uncultivated land, described as "morass" and "scrub," have been cleared and laid down with the most suitable grasses for cattle and sheep pasturage. In one instance, in Australia, 100,000 acres in one tract have been so treated with the best results; and not only is the laying down of new pastures being actively pursued by the richer colonists, but the renovation of old pastures also, thus giving a good lead to agriculturists. The necessity for the latter process is perhaps greater in the colonies than in the mother country, where the land is less fertile in its natural state; as in course of time the stronger rooting and more vigorous growing grasses assert their natural superiority over some of the weaker kinds, and either the process of depasturage or that of renovation has to be resorted to: the latter resource is necessary to maintain that equalisation of the particular grasses that provide the necessary principles of animal aliment.

In order to give some idea of the export trade done in grasses and Clovers, we may mention that, of the natural grasses, the largest shipments are made of Cocks-foot, one of the most luxuriant of grasses on

good soils; Timothy, hard, meadow and Sheep's Fescues; meadow Foxtail—the verdure of many of our rich meadows depending on this grass; the smooth-stalked Foxtail, and Yarrow, the common Milfoil, a subject which is very common to pastures on the roadsides in the country. Many of these are forwarded at the rate of tons each. Of the various Clovers, the white, red, Cow-grass, the perennial or wayside red Clover, and Lucerne, a deep-rooting perennial plant, sending up numerous tall Clover-like shoots. Rape is also largely sown in both Australia and New Zealand to ensure a quick crop, and considerable quantities are annually forwarded to the colonies.

The care exercised in the preparation and shipment of these various articles is commensurate with the importance of the trade. The heavier shipments of these seeds having to cross the Equator, unless each subject is sent in the driest and most perfect condition deterioration of the growing qualities is sure to take place, and consequently the risk of landing valuable consignments in an injured or worthless condition is very great. To avoid this as far as possible, certain precautions are taken. By means of careful trials of growth, seeds of the strongest vitality are ascertained, selected, and alone used. Each kind of seed is divided into small quantities, generally of half a hundredweight each, and these are placed in canvas bags, or, if sent loose, in water-tight or air-tight tanks. Formerly the greater part of the shipments were made in hogsheads, as these were the more easily disposed of when they reached their destination for such uses as water-tanks on river boats, for storing water in fields for irrigation and other purposes, and also for use in households. Italian and perennial Rye-grasses are exported in large quantities, and the demand is found to increase each season.

Such then are some of the details of a very important branch of the seed trade. The competition in this department is very keen, and it is found that the house that does the trade best is pretty sure to reap the greatest measure of support. Rare judgment is required, and a large capital, in order to make purchases and hold stock when it is politic to do so. In proportion as the colonies and America become meat-producing centres for the mother country, so will the demand for these seeds increase. In our own country the farmers are advised to breed cattle in preference to growing corn. One of their own body is found asserting that "by breeding cattle, and producing mutton and beef instead of bare or open fallows, or Wheat, we should, with less anxiety, be better able to face the rent-day, and other demands which are now such a burden on the lands where only corn is grown." R. D.

## CHRISTMAS ROSES.

NOTWITHSTANDING the severity of the weather during the past winter, with little or no sun to cheer vegetation, we have had an abundant supply of the above-named for some time past, and have still many more showing, with others in various stages of development; so that from present appearances they will continue to yield a succession for at least a month yet to come. The variety grown is *H. niger maximum*, a robust habited kind that has large thick leathery leaves, and huge crowns which send up immense numbers of blossoms. These have stout stalks about 6 inches in length, and being of such a fleshy nature they take up water freely, thus enabling the blooms to last almost as long as they do on the plants. This enduring power renders them particularly serviceable just at this season of the year, when flowers of all kinds are so scarce; and seeing the great ease with which they may be grown, the wonder is that they are not more cultivated, as all the protection they require in winter is that afforded by an old light or hand-glasses during the sharpest and worst of the weather. This simple covering not only renders them perfectly safe, but makes the blooms more pure by causing the petals to come quite white, instead of being stained with reddish green, as they generally are when left fully exposed.

Besides being valuable for growing out-of-doors to cut from, they are equally serviceable for potting for greenhouse decoration, or the adornment of windows, a position in which they show off their beauties and last a long time in perfection. The best way to manage them is to choose a nice sheltered

border under a wall, or along the front of a plant-house, as there the warmth prevents the ground from becoming frozen, and it is an easy matter in such a situation to place some sashes over them, and block up the ends by means of a mat, and so make the plants as snug and comfortable as if they were in a frame. There is an impression with some that Christmas Roses are difficult to increase, which is a fact so far as raising them from seed goes, as they seldom form any, the pods being generally barren, but like most perennials they may readily be propagated by division, if care is exercised, and the operation carried out without the use of a knife or other instrument to effect the necessary severance. The safest plan is to dig up the clump, and then either shake or wash the soil all away from the roots, when each small crown will be distinctly visible, and may be pulled apart with a root or two attached, each piece of which is then sure to grow. The proper time to set about the work of division is immediately after the plants have done blooming, as just then they are about forming fresh growth, and will stand more liberties being taken with them than at any other season.

Like most subjects of a kindred nature that send up and have to support such a vast quantity of large succulent flowers, this Hellebore requires good soil and plenty of depth of loose open material to work in, which may be afforded by mixing up a quantity of refuse peat, leaf-mould, and sand; and these ingredients, if worked into the ordinary garden soil, will make a bed in which it will revel. As this variety of Christmas Rose has great spread of foliage, it should not be planted nearer together than 18 inches or so. If well watered while making its growth, or given a soaking or two of liquid manure, it will be a great help in assisting the plants to become strong and fine. When required for potting, they should be lifted in November and stood in cold frames, that they may have time to take to the soil, when a few can be placed in a little warmth to bring them on, and so prolong the time of flowering.

The way the blooms look best when cut is by arranging them in bowls, or low flat vases, filled with green moss, where, with some of their own foliage, a spray or two of Lily of the Valley, Cyclamens, and Violets, a most interesting and natural-looking group may be formed. *7. N.* [A fine specimen of this variety, maximus, grown in a tub, and profusely flowered, shown at South Kensington on Tuesday last by Messrs. Osborn & Sons, was very attractive. EDS.]

NOTES ON NEW ZEALAND PLANTS.\*

HAVING long been strongly impressed with the notion that on the mountain ranges of New Zealand, and more particularly those of the middle and southern islands—New Munster and New Leinster—many hardy forms of the southern flora might be got that would impart new and highly important features to our forests, pleasure grounds, and gardens, I secured the good services of some friends who, from time to time within the last fifteen years, sent me such seeds from the provinces of Canterbury and Otago as they thought likely to interest me. From these seeds a few generally known hardy plants were reared, as well as the after-named less known kinds that, having withstood the rigours of the unusually severe and long-protracted winter of 1878-9, may be looked upon as sufficiently hardy for our climate.†

1. *PLAGIANTHUS BETULINUS* (Ribbon-tree of the settlers, and *Houti* of the Maori natives).—Described in Sir J. D. Hooker's *Handbook of the New Zealand Flora* as a lofty tree, attaining 40—70 feet in height, but that its wood is worthless; and by Captain J. Campbell Walker, Conservator of State Forests, in his

\* Notes on New Zealand Plants that withstood the severe Winter of 1878-9 at Rait Lodge, Trinity, near Edinburgh. A paper read at the December meeting of the Botanical Society of Edinburgh, by William Gorrie, of Rait Lodge.

† The minimums for the seven months of 1878-9 in which the temperature fell below the freezing point were as follows:—First column from observations taken at Edinburgh by the Scottish Meteorological Society with thermometer protected from direct radiation by louver boarding, in the usual manner; and second column from observations at the Edinburgh Botanic Garden, by a thermometer fully exposed to direct radiation:—

November, 1878	..	..	26.5	..	24.
December, "	..	..	9.	..	9.
January, 1879	..	..	16.5	..	12.
February, "	..	..	21.4	..	19.
March, "	..	..	17.	..	16.
April, "	..	..	28.7	..	26.
May, "	..	..	29.2	..	—

report of 1877, as "a graceful tree, 30—50 feet high, having white, compact, fissile, but not durable wood." Of several trees that I raised from seeds about ten years since, one that was planted in the open ground now measures fully 15 feet in height, and one on the south wall of my house is 23 feet. Both are of straight handsome growth, bearing considerable resemblance to our native Weeping Birch, especially in the size and form of their lower leaves, but those on the upper branches are three to four times larger. You will see by the branches before you that they are remarkably tough, so much so that they may be used like packing twine in tying; and I have found them very serviceable for fastening the branches of wall trees, not as is usually done with twisted Willows, but by knot-tying. In fact, their toughness is so remarkable that on the occasion of a Botanical Club visit in 1877 the members admitted that they had never seen such toughness in any unmanufactured vegetable substance. Having devoted considerable attention in endeavouring to discover a vegetable fibre capable of being profitably cultivated for paper-making, I some years since felt satisfied that the tough fibrous twigs and wood of the Ribbon-tree would be much more suitable for forming paper-pulp than the native Poplar, Fir, or other trees now in most demand for that purpose, and in this opinion I have been fully confirmed by that of eminent paper-makers and others well qualified to judge. Neither of my plants have as yet flowered, and as their propagation is somewhat difficult as well as tedious; seeds will have to be procured in considerable quantity from the native habitats of the Ribbon-tree in order to ensure its early and extensive introduction to British forest culture. As to the fore-mentioned worthless and non-durable character of its wood, it may be remarked that in young colonies the timber of unknown indigenous trees is generally judged of by its capability of withstanding the weather when employed for fencing and other out-of-door constructions, without regard to or in ignorance of its durability when kept dry; hence it may be presumed that the fissile or splitting properties and toughness of the Ribbon-tree timber may recommend it for making riddle-rims, basket-handles, barrel-hoops, and many other purposes. A keen angler, on testing some small twigs that I gave him, remarked that they would make excellent points for fishing-rods.

2. *PLAGIANTHUS DIVARICATUS*.—A small shrub, with many slender, spreading, tough branches. In all respects very different from and much inferior to the last, but equally hardy, and would seemingly make good sweeping-brooms and pot scrubbers. As it is only found in salt marshes, where very few shrubby plants thrive, its cultivation in such places might be found beneficial.

3. *PITTSOPORUM TENUIFOLIUM* (*Kohuhu* of the natives, and the fine-leaved Turpentine-tree of settlers).—"A bush or small tree, 20—40 feet high, with slender trunk." Timber, according to Captain J. Campbell Walker, "adapted for turnery purposes, and difficult of combustion." A plant 5 feet in height, on a south wall, withstood the last winter without injury, but several smaller ones of the same age suffered more or less in the open ground. Its beautiful glaucous, smooth, undulated, evergreen leaves render this an important addition to our ornamental wall plants; and a closely allied species (*P. Colensoi*) has thriven for a number of years in the shrubbery of my neighbour, I. Anderson-Henry, Esq., of Woodend, at Hay Lodge, where they now measure from 6 feet to over 13 feet in height.

4. *ARISTOELIA RAEMOSA* (*Makomako* and *Mako* of the natives).—A small, handsome tree, 6—20 feet high. Wood white, very light, makes veneers." Has grown for seven years on a south wall, where its branches have frequently been partly killed down, but were reproduced in the following season without any apparent diminution in vigour. The very elegant, largish, irregularly formed deciduous leaves of this plant fully entitle it to a place on ornamental garden walls. Some plants which I gave to Lady Orde, four or five years since, have proved perfectly hardy in the mild west-coast climate of Kilmory, Lochgilphead.

5. *DISCARIA TOUMATOU* (the "Wild Irishman" of settlers).—"A thorny bush in dry places, becoming a small tree in damper localities, with spreading branches, and branchlets reduced to spines 1—2 inches long, which were used in tattooing" (Hooker).

This curious and very interesting plant has stood in the open ground with me perfectly unharmed for five or six years, as have also plants which I gave to Miss Hope, of Waudie, and Charles Jenner, Esq., Easter Duddingstone Lodge. The seeds from which these were raised were from the province of Canterbury; and one of my plants produced in the middle of last June a number of pretty small white flowers, but these were not followed by seeds, owing, I suppose, to the inclemency of the season.

6. *CORIARIA RUSCIFOLIA*, and *C. SARMENTOSA* of botanists (the Toot poison-plant of settlers, and the *Tutu* or *Tua-tutu* of the natives).—The disastrous cattle-poisoning peculiarity of the Toot have rendered it too well known to New Zealand agriculturists. Having cultivated a number of plants for some years, the seeds of which I had from the province of Canterbury, I found that at the base of a south wall they stood most winters unharmed, and had only the points of their shoots injured by those of unusual severity. In consequence of making some ground alterations at an unfavourable season for transplanting, I lost my Toot plants three or four years since. Although they seemed to thrive well all the time I had them, they never assumed that tree-like form of growth which Sir J. Hooker and other New Zealand botanists attribute to this species, but presented more of a sub-shrubby habit.

7. *EDWARDSIA* (*Sophora*) *PULCHELLA*, and *E. GRANDIFLORA* (the native Laburnums of settlers, and *Kewhai* of the Maoris).—These two, and the *E. microphylla*, grow to about the size of our European Laburnums, and, like them, have dark-coloured heartwood, which is "valuable for fencing, veneers, &c." Although all very distinct, these three and another have been included under the generic name *E. tetraptera*; and the first, although easily distinguished by its slender, zigzag, flexuose branches, has been deemed identical with the straight-branched and more robust-growing *E. microphylla*. It has grown quite freely with me for the last twelve years on the south side of a 7 feet high wall, which it now over-tops with its thickly-branched head; and its seeds have this peculiarity—that while many came up in succession in each of the five following years. *E. grandiflora* was planted out in spring, 1878, when about 2 feet in height; also on a south wall, and it stood the last winter perfectly uninjured.

8. *RUBUS AUSTRALIS* var. *CISSOIDES*.—The leaves of this variety have the peculiar appearance of being almost exclusively composed of rigid, prickly midribs. It and several other varieties form thick, rambling, very prickly, various-sized bushes, and are all about equally hardy, standing our severest frosts in moderately sheltered dry places. They are termed "Lawyers" by the settlers, and *Tataramoa* by the Maories.

9. *LEPTOSPERMUM SCOPARIUM* (the Tea-tree and Brown Myrtle of settlers, and *Manuka* of the natives).—A pretty white-flowered, large evergreen bush or small tree, the leaves of which are used as tea, and the twiggy branches for brooms. Among a number of three-year-old plants in the open ground several almost escaped injury, while others were more or less killed down. Like No. 4, it appears to be perfectly hardy in our west-coast climate.

10. *FUCHSIA EXCORTICATA* (*Kohutupu* of the natives).—This once common inhabitant of our greenhouses, although never entirely killed, has its shoots so frequently cut down as to prevent it from flowering, and gives it a sub-herbaceous appearance.

11. *FUCHSIA PROCUMBENS*.—This pretty little trailing plant, which within the last few years has become common in our greenhouses and flower shows, has stood on a rockery for the last three years, and appears quite hardy.

12. *ACIPHYLLA COLENZOI* (the "Wild Spaniard" and "Spear-grass" of the settlers, *Kurikuri* and *Papaiti* of the natives).—In Sir J. D. Hooker's *Handbook of the New Zealand Flora* this extraordinary evergreen herbaceous plant is described as forming a circular bush, 5—6 feet in diameter, of hayonet-like spines, impenetrable to men and horses, having 6—9 feet high flowering-stems, covered with spreading, spinous leaflets. In another description its leaflets were stated to be as long, broad, and rigid as British

bayonets, and a great deal sharper. Induced by these descriptions I procured a number of packets of "Wild Spaniard" seed in different years, but only one of those packets produced plants, and that after they had lain in the soil over one year. Although a real umbelliferous plant, it has more an appearance of some of the dwarf Palms; and an eminent botanist to whom I gave a plant, had it included among such in a list of his varieties which he afterwards sent me. The Carrot-worms knew better; for on looking at my pot of seedlings one morning I found that they had destroyed more than the half of them. Planted on rockeries where fully exposed, several plants have stood uninjured for five or six years. The strongest of these flowered last summer, when it sent up a flower-stem nearly 4 feet in height; but owing, I suppose, to the very wet and cold weather, it damped or rotted off without perfecting seeds.

13. *GRISELINIA LITTORALIS*.—According to Capt. J. Campbell Walker, this in its native localities is a handsome tree 30 to 40 feet in height, the timber of which is hard, compact, and of great durability, valued for fencing-posts, sills, boat-knees, &c. A plant, now about 6 feet high, has stood in the open ground without injury for eight years. As an ornamental broad-leaved evergreen it is superior to the common Bay Laurel, and is decidedly hardier than either it, the *Laurastinus*, or the *Aucuba japonica*; hence its cultivation is being rapidly extended. Another species, *G. ma repbylla*, has been repeatedly killed in the open air, even although having the protection of a south wall; but its much larger and very handsome foliage entitles it to a prominent place among plants for house and table decoration.

14. *COROKIA COTONEASTER* (*Korokia* of the natives).—A low, spreading evergreen shrub, with thickly interlaced small tortuous branches. Two varieties of this curious and highly interesting plant, trained on a south wall—the one about 5 and the other fully 7 feet in height—were uninjured, and last spring both were thickly clothed with a profusion of small bright yellow flowers. In each of the last four seasons they have borne a few oblong bright red berries, which may be produced in much greater abundance as the bushes become older. Last winter some plants in the open ground were considerably injured, but these sent up numerous young shoots in summer.

(To be continued.)

## PLANT PORTRAITS.

*APHELANDRA PUMILA*, Hort. Bull.; *Bot. Mag.*, t. 6467.—A short-stemmed species, with large cordate ovate-oblong acute leaves, purplish bracts, and orange flowers. Brazil.

*BEA HYGROMETRICA*, Brown, *Bot. Mag.*, t. 6468.—A Gesneraceous plant, with tufted leaves thinly covered with coarse white hairs, ovate acute at both ends, crenate serrate; peduncles leafless, erect, with a few irregular violet flowers at the top. The capsule is elongated and spirally twisted. The plant is a native of North China, the headquarters of the genus being in the hills of East Bengal and Birma, but other species are found in the Philippines, North Australia, and in an island of the Western Pacific—an extraordinarily wide distribution.

*CYNOCHES WARSCWICZII*, *Foral Mag.*, t. 381.—The very curious dimorphic Orchid figured in our columns, p. 493, vol. xii.

*DAHLIA JUAREZII*, *Foral Mag.*, t. 383.—See *Gard. Chron.*, vol. xii., p. 433.

*GLADIOLUS BRACHYANDRUS*, Baker, sp. n., *Bot. Mag.*, t. 6463.—A native of South-east Tropical Africa, with short leaves, and racemes of erect, funnel-shaped, reddish flowers, with unequal pointed segments. Edinburgh Botanic Garden.

*HIBISCUS ROSA SINENSIS*, *Revue de l'Horticulture Belge*, December.—The varieties figured are those named *Denisoni* (A), and *cruentus* (B).

*HIBISCUS ROSA SINENSIS SCHIZOPETALUS*, *Garden*, Nov. 29.—A coloured figure of the remarkable plant figured by us at p. 273, vol. xii.

*LUZURIAA RADICANS*, Ruiz et Pav., *Bot. Mag.*, t. 6465.—A Smilacaceous perennial, with slender wiry stems, sessile, glabrous, ovate lanceolate leaves; nodding flower-stalks, shorter than the leaves; flowers  $1\frac{1}{2}$  inch in diameter, regular, star-shaped, pure white; anthers yellow, connivent into a cone. Native of

Chile. Thrives well in the Temperate-house at Kew, and would doubtless be hardy in some localities.

*NECTARINE GALOPIN*, *Florist*, t. 504.—Fruit large, globose; skin thick, yellowish-green, flushed on the sunny side with reddish-violet; flesh greenish, juicy, melting, piquant, perfumed; glands reniform. Raised at Liège by M. Galopin. A free grower and a good cropper.

*NEPENTHES OUTRAMIANA* ×, *Foral Mag.*, t. 384.—Pitchers green, brightly mottled and blotched with crimson, wings ciliate, dentate. It is a cross between *N. Sedeni* and *N. Hookeri*.

*PELARGONIUM* (Decorative) *VOLONTÉ NATIONAL*, *Foral Mag.*, 382.—Flowers roundish; petals undulate, two upper with a deep shaded rose blotch, three lower with paler blotches.

*PELARGONIUM* (Ivy-leaved) *ST. GEORGE*, *Florist*, t. 503.—A cross between *P. peltatum* as the seed parent and a zonal variety which furnished the pollen. The leaves are of the Ivy-leaved section, the flowers circular, bright salmon-red. A cross as interesting as it is beautiful.

## MR. LADDS' BOILER.

THIS (fig. 16) is the boiler which Mr. Philip Ladds uses in his immense establishment at Bexley. No other form of boiler is here employed for heating the whole of his houses, which collectively represent a glass surface just upon 9 acres. It is a horizontal tubular, made of 2-inch pipes socketted into hollow water-spaces, which form the ends. As will be seen,

FIG. 16.—MR. PHILIP LADDS' BOILER. (SCALE THE SAME AS IN FIG. 17.)

these water-tubes act as fire-bars, and enclose the fire-space on each side as well as immediately above the fire, added to which there are two other additional series of pipes above those immediately over the fire. The fire is made to traverse each course backward and forward the length of the boiler by means of tiles laid on the top of the pipes in such a way as to direct such portion of heat as leaves the fire-box immediately into contact with these upper tiers of tubes. The boiler is 6 feet in length. By the use of these tiles the heat is made to pass in absolute contact with each of the upper series of pipes—in all to an extent of 18 feet; in fact, by this very simple division of each tier of pipes the boiler becomes absolutely a flued tubular. Its great advantage above that of other horizontal boilers composed of water-tubes is that the heat is thus compelled to traverse and is brought in immediate contact with the whole surface of the pipes, and has not the chance as it escapes from the burning fuel of making its way right through them and into the chimney, as it would if the tile divisions were non-existent—a fault which most other horizontal tubulars have hitherto had more or less.

Mr. Ladds buys the castings, and has them put together by his own men. The tubes are all put in with Portland cement—the packing being hempen cord material, something like an ordinary clothes line, not tar rope. Mr. Ladds finds that if the latter is used the tar destroys the cement. The boilers heat 3000 feet of 4-inch piping each, and some of them over this amount; he sets them mostly three together in each stokehole side by side, each enclosed up the sides with only 4½-inch brickwork, with a cavity betwixt each boiler as well as on the extreme outsides of about 2 feet 6 inches, so as to readily admit of the

introduction of a new tube, should one happen to be required, as now and then occurs through getting corroded by deposit from the water used. Valves are employed, so that each boiler can be shut off from the other, as well as from the series of pipes which they heat.

If a tube happens to require replacing, from the facilities provided for getting at it, it is done in a few hours through the light brickwork with which its sides are enclosed, as well as the very simple covering over the tops of the boilers. This latter consists of about 9 inches of ashes put on the tiles which cover the topmost tier of pipes. On the ashes are laid ordinary inch-boards, which rest on the walls that enclose each boiler, which for this purpose are carried 9 inches above the tiles. The boards are used in separate lengths across each boiler, and also separate lengths for the cavities, which, as will be understood, permits of any particular point that may require it being got at without disturbing the whole, as would be unavoidable if the boards were entire, running right across the boilers and the cavities. On the top of these boards is placed 8 or 10 inches more ashes. Wood, as is well known, is one of the best materials that can be employed as a non-conductor, and its effect here is most marked, as the warmth on the top of the ashes is scarcely perceptible. At first sight it would be supposed that the boards so near the fire would ignite, but they are not found to do so, which is one of the best proofs that the heat from the fuel is absorbed by the water before it reaches the chimney.

In addition to these boilers being cheap they consume little fuel, and are extremely powerful, which is evidenced by the return pipes which, after traversing the large houses here—over 300 feet in length—seem very little reduced in heat, when felt by the hand, as compared with the flows—a circumstance that cannot possibly occur without sufficient boiler-power to cause a rapid circulation. Something similar to this boiler has been used by others, but apparently it never became so much known as to bring it much into use. *T. Baines.*

## MR. BECKWITH'S BOILER.

THE boiler here illustrated (fig. 17) is the one designed and used by Mr. Beckwith, of Tottenham, who, as is well known, is one of the most extensive growers of plants for market. As will be seen, it is a very large one, and is immensely powerful—so much so, that I am not aware of anything in existence at all approaching it. It is made altogether of 3-inch pipes, cast with a smaller core than ordinary, so as to give increased strength and thickness to them. They are socketted in the usual way into three hollow water-spaces, or, as more usually termed, coil boxes—the first of these, which, as shown in the illustration, is a square hollow water-way or rim, forming the front of the boiler, with a single row of pipes on each side, the top and the bottom. The back of the fire-box, which is 4 feet 6 inches in length, is formed by another hollow water-way, in which the opposite ends of the pipes, which thus enclose and form the fire-space, are similarly socketted.

The extension of the boiler beyond the furnace is 13 feet 6 inches, and consists of what may be described as a stack of water-tubes nine deep and seven

wide, socketted into the second water-space, already mentioned, that forms the back of the fire-chamber, and into the third of these hollow water-boxes at the extreme end, giving a length of boiler of 18 feet in all. The whole rests, as shown, on three brick piers, running right across and immediately under the three hollow water-spaces. The current of heat which leaves the fire-box is directed through the entire length of the stack of tubes in the 13 feet 6 inches space beyond, and to force it to descend to the lower portion of them there is a division midway, composed of brickwork, extending across the whole from the top downwards to within some 10 or 12 inches of the lower series—without which, as will be easily understood, the action of the current of heat would in a great measure be confined to the upper coils of the tubes. After being in this manner forced down through the first half of the tubes beyond the furnace the current finds its way upwards through the second half to the chimney shaft.

When set the boiler is enclosed from end to end with 4½ inch brickwork with cavities on each side of about 2 feet 6 inches, formed by outer brick walls so as to effect any repairs that might want doing. All the joints with which the fire comes immediately in contact are made of one-fourth iron borings to three-fourths Portland cement alone. The return water enters at the bottom at the furthest end, the flows are of course from the top, and at each end of the boiler. It may be well to notice that the depth of these boilers from top to bottom is about 12 inches more at the back than the front, and from the natural

unusual power and economy in fuel of this description of boiler is unmistakably owing to their being horizontal, and to their great length—the latter an absolute essential, hitherto insufficiently kept in view in the construction of garden boilers. The small quantity of fuel required to drive these seven boilers would scarcely be credited; yet I may state that of coal, coke, and breeze, the amount is in all six hundred and fifty tons per annum, which gives to each boiler ninety-three tons a year, or only an average of a ton and three-quarters weekly.

Others of the market growers are adopting these boilers, in some cases slightly modified and reduced in size, according to the requirements of the respective places where employed. Mr. Rochford, of Page Green, Tottenham, has two of them at work, but much smaller so far as the number of tubes goes. His fire-bars are of 2-inch tubes socketted into the front hollow water-space, with syphon ends at the back, resting in the brickwork that forms the back of the furnace, which furnace is 4 feet 6 inches long by 20 inches wide and 20 inches high; the pipes, two in number, which form each side of the furnace, are also socketted into the front water-way, and run right through the wall at the back of the fire-space, and 9 feet beyond it, where they are inserted into another hollow water-way; the top of the boiler consists of a double series of pipes, nine in number, angled, and, like the sides, running the whole length, are also socketted into the front and back water-ways; these tubes, which form the sides and top of the boiler, are all strong 4-inch pipes, such as used by the

portant calculations upon them; and I am sure Mr. Smith would not risk his capital in an investment so vaguely described. The quotations are chiefly from essays contributed to the Scottish Arboricultural Society, and the writers had in view the gaining of prizes. The late Mr. Thomson, it will be observed, with one compound blow cut the round and handsome ideal sum of £330 of somebody down to £100; and another, and by no means severe or unnecessary stroke, would have brought the figure down to ordinary capacity.

Mr. Gigor, in his excellent treatise, where he quotes the value of the plantation at £50 per acre, probably included its value as a shelter producer; and as I know the plantation well to which he refers, I incline to this belief. I wish to state, however, once for all, that I am not inclined to discuss men, either living or dead, neither am I disposed to criticise books: to do the former is hazardous and dangerous, and to undertake the latter would involve a task analogous to what Solomon says of making them. The case under dispute is whether a Scots Fir plantation at fifty years' growth, upon the poorest description of moorland, is worth £131 13s. 4d. per acre as a marketable commodity, or even half that sum. My sole reason for disputing it is because I have never seen it, but, as Mr. Smith very justly remarks, others may have met with such subjects though I have not. What has been, I have no doubt is and will be, and therefore I hope to hear through some source that such plantations actually exist in verity, and that I may have the pleasure of seeing them. Having from time

FIG. 17.—MESSRS. BECKWITH AND SONS' BOILER.

inclination thus given to the lowest pipes to rise gradually from the back, where the return water is admitted to the front of the boiler, with a corresponding rise from front to back in the top pipes from whence the flow water proceeds, the arrangement helps the circulation. As will be easily understood, boilers of this description require to be put together in the place where they are to stand. They are in reality home-made, as Mr. Beckwith simply buys the materials, and has them put together by some of his own men.

The enormous power of these boilers may be judged from the fact that Messrs. Beckwith, in the immense quantity of plants they force, in all probability keep up a higher temperature in a proportionately greater number of large houses than any other public or private establishment in the kingdom. In the whole of their houses there are over 7½ miles of 4-inch piping, all of which is heated by seven of these boilers, consequently there is considerably over a mile of piping to each. The first of these boilers has been in work sixteen years, and I understand has not had so much as a single pipe replaced, or a joint made good in any way. The complete absorption of heat before reaching the chimney can be easily seen through a little contrivance that Mr. Beckwith has devised for testing this. At the bottom of one of the chimney shafts, a foot or two from the end of the boiler, is inserted a small iron box-frame, something like a soot-door for cleaning out the flue of an ordinary boiler, and which can be similarly opened and closed; during severe frost, when the fire is going at full swing the heat inside the chimney can be comfortably borne by the hand thrust in here. The

gas companies. Like Mr. Beckwith's boiler, there is midway, in the extension beyond the fire-space, a brickwork division extending right across the pipes, so as to force the current of heat again to the bottom, from which point it rises through them to the extreme end, where it enters the chimney.

Nothing could be more simple than this boiler, it merely consisting of the 2-inch pipes acting as water-bars, 4 feet 6 inches in length, and of thirteen 4-inch pipes, which form the sides and top of the boiler running the whole length, 13 feet 6 inches, and the two hollow water-ways back and front, each about 6 inches: giving 14 feet 6 inches for the extreme length. One of these simple contrivances is now heating effectually 12,000 feet of glass without the slightest strain. So easily is the work done, that Mr. Rochford assures me it consumes no more fuel than a common 3-feet saddle usually requires, and a great portion of that which he uses is breeze. The second boiler will shortly have as much glass to heat as the one described. *T. Bates.*

## Forestry.

THINNING SCOTCH FIR PLANTATIONS.—I have read with care Mr. Smith's remarks upon my last article on Forestry, and am quite satisfied with both the letter and spirit of his remarks. I have also read the quotations, and do not find any of them, to my mind, sufficiently clear and explicit on the point. They all indicate what is desirable, possible, or probable, but none of them give data sufficiently substantial and positive to warrant any one basing in-

to time, as I had opportunity, valued the woods and plantations under my charge here, I annex a few examples taken at random from my reports, and shall be very glad to learn how they compare with others which have been carefully inspected and valued under like circumstances. No. 1 is what is termed a mixed Fir plantation, being composed principally of Scots Pine, with a small mixture of Larch, Norway Spruce, and a few hard-woods on the margins. The plantation was formed in 1826, and comprehends in round numbers 63 acres. At the date of valuation (1869) it contained an average of 290 trees per acre, namely, 260 Scots Pines, twelve Larch, four Norway Spruce, and eight various. The value of the whole plantation was £1044; its state of growth fair, making annually 17s. per acre; the transferable value was £16 per acre, and prospective value, when sixty years old, £26 per acre. This plantation, having been several times thinned, and now being forty-three years old, is understood to have repaid the original cost; hence, in making up the transferable value, no allowance is made for such original outlay, but the value computed at the annual rate of growth. This plantation was thinned in 1870, the year after the valuation was made, and 3720 trees taken out of it, which on being sold by auction realised £108 5s. 6d. The cutting, lotting, and preparing for sale cost £23 6s. 1d., and the sale itself an additional £5.

Drainage.—When the plantation was formed 7860 yards of surface-drains were cut, and these, having filled up, have been twice cleaned out: the fence with which it was enclosed was a turf dyke 3432 yards in length, and this has also required repairing from time to time.

*Roads.*—Openings termed green roads were formed for clearing the thinnings, extending to 1200 yards. Since about twenty-five years' growth the plantation has been let for grazing purposes. The rent at first was £5, and now it is £11 per annum for the whole, and increasing. It will be seen that the highest attainable value of this plantation is estimated at only £26 per acre—a small sum for a plantation whose annual value of increase of growth is 17s. per acre. This is explained by the circumstance that a considerable number of deaths occur yearly, especially of the Larch, the soil being too clayey and damp for Pine or Fir attaining age and perfection.

No. 2 is another mixed Fir plantation, planted in 1844, containing 41 acres, and comprehends 345 Scots Pine, fifty Larch, five Spruce, equal to 400 trees per acre in all. The present market value of the whole plantation is £326; average annual growth 300 lineal feet per acre, value 12s. 6d.; transferable value, £8 per acre; and prospective value, when sixty years old, £29 5s. It is let for grazing purposes at £16 per annum.

No. 3 is a mixed Fir plantation, planted in 1837, and comprehends 14 acres. In 1868 it contained 330 trees per acre, namely, 282 Scots Pine, forty-one Larch, two Spruce, and two various, and worth altogether £128 5s. Annual growth value, 27s. per acre; transferable value, £9 per acre; and prospective value at sixty years' growth, £56 11s. It was thinned in 1869 to the number of 500, which realised by auction sale £15, equal to about 4½d. per tree; cost of cutting, lotting, and sale, £2. C. Y. *Michie, Cullen House, Cullen, Jan. 12.*

## Notices of Books.

**Hardy Florists' Flowers: their Cultivation and Management.** By James Douglas, F.R.H.S., Gardener to Francis Whitburn, Esq., Loxford Hall, Ilford, Essex. Published by the Author.

This is a handbook of the culture of florists' flowers, especially relating to those hardy ones which are within the reach of everybody who cares to grow them. Such a book, alike concise and trustworthy, was much needed, now that the taste for these flowers is spreading amongst the general public, and now that new recruits may be expected to be enlisted in the cultivation of special flowers. Those who are commencing the collection of this class of plants will find such a guide as this invaluable, and will welcome it accordingly. It is the amateur who has not yet bought his experience, and the professional gardener who has not come in the way of these subjects, and who consequently has no clear practical knowledge of the technicalities incidental to the successful growth of many of them, that the information contained in these pages will be found specially useful. It is to meet the want, the growing want of this information, as the author tells us, that he has thus strung his thoughts together, and committed them to print.

The Rev. Mr. Horner well observes, in the course of a few introductory pages contributed to Mr. Douglas' book, that:—

"The spreading interest in what are known as florist-flowers will lead, it is hoped, to their gaining the favour and influence they deserve to hold in the floricultural world. Floral fashion may be to blame for much, but if there has been really a forsaking and forgetting of florist-flowers, a heartless fashion has perhaps been least amongst possible causes. For these special flowers have not found a home in formal gardens, where play of changeable fancy was likely to displace them. They were never in the hands of those to whom flowers are mere masses of so much colouring matter in natural plants; for whom garden arrangement, forms and tastes must ever alter—as though the garden were a huge mechanical optical toy, setting forth (like the child's kaleidoscope with its magic stained-glass flower-beds) a new combination of its colour-sets at every periodic twist of fancy. A touching history, if it could be written, would be the nurture and ministry of florist-flowers. They have been the delight of many a man in whom the love of Nature was robust and inextinguishable, but whose means were very spare, whose leisure time was very scant, and whose advantages in pure air and light and garden space were very poor and cramped."

On such as these did the spring smile in his Polyanthus, his Anemulas, and his Pansies; and on such as these did the summer pour forth its bloom of Tulips, Pinks, Ranunculuses, Carnations, and

Picotees; and thus through one or more of these media the love of Nature found expression, and enough to live upon.

Mr. Douglas has done good service to the floral cause by contributing to its literature at this juncture a handy little volume, which will prove "a guide to the stranger; a remembrancer for him who may not, since long ago, have been able to tread the floricultural paths he loved of old." Both may repose confidence in the directions and instructions of one who has had the heart and the opportunity to grow skilful in the culture of the flowers of which he treats, and who has proved his right to an honourable place amongst the floral fraternity by his position on the prize lists at the floral exhibitions.

The volume comprises chapters on all the more popular of our old hardy florists' flowers, as the Auricula, Polyanthus, Pansy, Tulip, Pink, Carnation, Picotee, Hollyhock, &c.; on some of the more modern subjects, as the Gladiolus, Pentstemon, Phlox, Pyrethrum, &c.; and on one or two other general favourites, as the Dahlia, Chrysanthemum, &c. The increase, cultivation, and exhibition of these are briefly but clearly treated on, and a selection of choice varieties is added as a guide for the purchaser. There are several illustrations, some from our own pages, scattered through the work, and the printing and get-up leave nothing to be desired. Thus, we have in *Hardy Florists' Flowers* not only a trustworthy but a tasteful and presentable little volume.

**Vegetables, and How to Grow Them.** By Joseph Lawdell. Leicester: H. J. Marshall.

This small *brochure*, as stated in the preface, is a condensed work of the practical experience of the author in growing vegetables for twenty years in some of the most noted gardens of England, and is intended for the use of amateurs.

From a perusal of this little work, there can be no doubt of the sound, intimate, and practical knowledge which the author possesses of the subjects on which he writes, and there is much useful information to be found in its pages. The management of the ground, rotation of crops, and modes of cultivating the various sorts of vegetables, &c., are of the very best, and, carefully followed, would insure success; but it is more the ordinary practice of the professional gardener that is detailed, than simple rules for amateurs to follow. For example—in the planting of Asparagus our author states that, to avoid the roots being exposed, it is best to have three men—the first to take up the plants, the second to place them, and the third to cover or plant them.

It seems a pity the author should not have had this little work better revised before publication. There is scarcely a page free from some stupid or amusing blunder or miss-spelt word, that completely spoils the whole. For instance, in speaking of the rotation of crops, what can be understood by "No one kind of vegetable should be planted on the same ground unless it is Potatos"? And again, in speaking of Lettuces, "Where slugs are troublesome, they should be watched night and morning." "A good plan is to take a flower-pot half full of fresh lime, and put them in as you catch them"—rather a sluggish occupation if followed literally. "Borecoles are to succeed a crop of Peas or Gooseberries"—as if Gooseberries were a rotation crop; offset Onions are to be "sown thickly, in the same way as pickles;" and, amongst Onions, "Covent Garden pickles is a good one."

The mistakes in spelling are very numerous—for instance, "bulbous" for bulbous, "Castle Harly" Beet for Castlenaudary, "Scrymar's" for Scrimgeour's, "Ayrton Castle" Leek for Ayton Castle, "large yellow Rorton" Leek for large yellow Roiton, "large Rowin Leek" for large Rouen, &c.

— *Bulletin de la Fédération des Sociétés d'Horticulture.*—The volume of the *Bulletin* of the associated horticultural societies of Belgium for 1878 is before us. It is largely occupied with statutes and official reports of the societies constituting the Federation, including a full report of the last quinquennial exhibition at Ghent. In addition there is a complete list in French and Flemish of Belgian fruits; M. Morren's useful "Correspondance Botanique"; and a detailed report by M. Dechevalerie on the horticultural section of the Paris Exhibition.

— *Annuaire de l'Horticulture Belge.*—A useful little publication, intended for the special requirements

of amateurs. The contents are very varied, and there are numerous illustrations, some of which, however, are rather coarse in execution, and have been carelessly printed.

— *The Biographical Encyclopedia of the Nineteenth Century.*—A recent part of this beautifully got up publication contains a finely executed portrait of Hon. Marshall Wilder, and a sympathetic biographical notice.

— PUBLICATIONS RECEIVED. — *Proceedings of the Academy of Natural Sciences, Philadelphia, Part II.* April—October, 1879. — *The Sizing of Cotton Goods, and the Causes and Prevention of Mildew.* By William Thomson, F.R.S. Edin., &c. (Heywood, Manchester). — *The Trees and Shrubs of Fiji and Kinross.* By John Jeffrey and Charles Howie.

## Garden Operations.

### KITCHEN GARDEN.

**CAULIFLOWER.**—The delicacy and excellence of this vegetable chiefly depend on the rapid and vigorous growth which the plant makes after it has once started. This circumstance, when considered in conjunction with other points, such as the nature of the plant and the mode of cultivation, renders it a subject which requires more than ordinary attention on the part of cultivators generally. Like all the rest of the Brassica tribe of plants, the Cauliflower requires soil of the very best description, which has been well cultivated, is moderately deep and highly enriched, and for a general crop an open space is to be recommended. In the first instance the primary object in cultivation is to obtain a supply of it ready for use by the time the crop of Broccoli is either exhausted, or its quality has become so greatly impaired, and itself so unpalatable as to be unfit for certain purposes; and secondly, to continue a subsequent supply as required throughout the rest of the season, which only terminates when frost comes and renders a continuance utterly impracticable.

I may here remark that it is the extreme prolongation of the season of certain culinary subjects which, under such changeable and conflicting circumstances as those to which we are exposed in this climate, is the cause of almost ceaseless anxiety and attention in order to attain the end required. In our endeavours to meet these requirements from year to year, the autumn seed-beds are here prepared on an open space where the soil is rich, and the seeds are sown about August 20. As early kinds we prefer Frogmore Forcing and Early London, with Walcheren as a late sort. We also grow another very excellent variety, which is not yet in commerce, named Bailey's Selected; this, undoubtedly, will prove to be the best extant. When the plants are ready, the most advanced of the early sorts are carefully lifted, and potted firmly in rich soil in 60-sized pots, and placed in an open frame where protection can be afforded. By-and-by these plants form the early section, and are planted out under hand-glasses, at the base of south walls, and in other sheltered places which have been prepared for them. By about the first week in February the next or second section of plants is taken from the same beds, and pricked out into prepared stuff, somewhat adhesive and rich for lifting purposes. These plants are intended for the general crop, and are not transplanted until about the first week in March, when they are placed with all the material possible adhering to them, about 2 feet 6 inches apart every way, on an open flat, in some of the best ground at command. The third and last section of plants, which we obtain from the same beds, are the smaller plants; these are put into 60-sized pots, and kept as cool as possible during the winter months, and afterwards are removed in the pots to the back of a north wall, and subsequently planted out towards the end of May. On this occasion part of the plants are planted on north borders. By these means we have been able invariably to meet all demands for this vegetable until such time as others come in from the early spring sowings, which should be made first in a frame or in a sheltered corner early in February, and another out-of-doors about the end of March. These plants undergo the same preparation by being pricked out in the first place, and then transferred to where they are to be grown afterwards. We find that by this process the plants become strong and sturdy, and capable of withstanding the attacks of those pests which under other conditions are so troublesome to this tender subject.

The after-cultivation consists of merely stirring the surface soil occasionally about the plants until the mulching material is applied, which should be done before vigorous growth proceeds, after which all that is required will be copious supplies of water whenever dry weather prevails. When the heads begin to appear shade them from atmospheric influences by covering them with some of the larger leaves off the

plant, and in the autumn months, if frost is expected, they should be taken up with a ball of earth attached and placed out of the reach of frost until they are wanted for use. In addition to the varieties which we have already named we can also confidently recommend for autumn use Veitch's Autumn Giant and Dickson's Eclipse—the latter kind here has proved to be very true in its character and invaluable as an autumn kind, so much so that this year we are trying it beside such sterling sorts as those which we have before named.

Ordinary matters which will now demand attention in this department will include the making of successional sowings of Peas, Beans, &c., and to the arrears of any kind of work which has been neglected, which will need immediate attention in order to be ready for the purposes for which it is wanted at the time required. *G. T. Miles, Wycombe Abbey.*

FRUIT HOUSES.

ORCHARD HOUSE.—When writing last on this subject, it was stated that the trees for late houses wintered out-of-doors were being moved into the house. They are now under cover, the pots washed clean, the trees all looked over to remove dead wood, of which there is none on the young trees, and but little on the old ones; and it may here be mentioned incidentally, that when some of the branches die back on old trees and continue to do so during the season, it shows that they are not vigorous enough to produce good fruit, and that they must be replaced with young ones as soon as they can be prepared. "Maiden" or trees one year from the bud may yet be potted, if this was not done in the autumn.

There is one side of orchard-house culture that I have not looked at in these notes, and that is the profitable one. In the first place there are quick returns. A pot tree the third season from the bud will produce a fair crop of as good fruit as can be grown by any other means, and if it is ripened earlier than out-of-doors fruit, it will command a ready sale. Strawberries ripened on shelves near the glass in orchard-houses are of splendid quality, and may easily be ripe two or three weeks earlier than those out-of-doors. Lettuces and other vegetables may be produced early and of good quality from the borders; and when all is done that can be done in the production of fruit and vegetables, the house may be cleared in October for a display of Chrysanthemums—not to produce cuttings or plants for sale, although there could be no objection to include this, but to produce cut flowers late in the season, and for this purpose only those that would command a ready sale should be grown. That the above system of management may be successfully and profitably carried out I am certain.

In the late house we admit plenty of air at present, and we are rather careful as to watering the trees at the roots; they are not watered until they really want it, and then enough is given to thoroughly moisten the ball of earth. A look-out must be kept for sparrows—in bad weather they like the dry warm air of the orchard-house, and repay us for the shelter by eating the flower-buds as soon as they show colour; it may be necessary to place netting over the ventilators to keep them out. The glass and woodwork of our house, too, is quite coated with the "blacks" after the last fog, and it ought to be washed thoroughly; this is even more needful in the house where forcing has commenced, as the swelling buds require all the light at our command at this season of the year. In fact, we never have too much light for Peach trees in England. *J. Douglas, Loxford Hall.*

ORANGE HOUSE.

We are now gathering very large and good flavoured fruits of the St. Michael's variety. It is not quite so full of juice as we have had it in other seasons, but is certainly better in that respect and of superior flavour to the foreign fruit. It is best to place the trees in a cooler house when the fruit is quite ripe, and as soon as it is gathered the trees may again be placed into heat, or they may be kept in a cool dry atmosphere for a month or six weeks. This plan may be pursued when the fruit has ripened in a Pine or Cucumber-house; but if the house is entirely devoted to Orange culture the temperature may be lowered for a few weeks, and the atmosphere be kept rather drier than usual. A period of rest such as the Vine requires is not necessary for the Orange tree. The way in which the blossoms burst into full beauty before the ripe fruit has been gathered shows this; and I have obtained crops from trees for three successive seasons plentiful in quantity, of large size and excellent quality, that had been kept in a high temperature all the time. Some of the trees will blossom this month, and it is desirable to keep up a temperature of 60° at night for them and a rather dry atmosphere. *J. Douglas, Loxford Hall.*

PEACHES AND NECTARINES.

Early houses, where space is limited, offer great temptations to the gardener who has Strawberries or Tea

Roses, and other subjects requiring gentle excitement. These advance very well together until the Peaches come into bloom, when it often happens that the pot plants are removed to another structure and frequently leave a legacy in the form of greenfly behind them. To secure freedom from these pests during the blooming period, and to prevent their spread into other houses, the Peaches should be carefully fumigated before the flowers begin to open. It is just possible that constant syringing may have kept the enemy out of sight only to appear in troublesome numbers when the dry warm fertilising period arrives; and as fumigating injures delicate flowers, every Peach-house, whether it be used for pot plants or not, should be smoked when this stage has been reached. Where forcing was commenced in November the buds on the most forward trees will now be opening. If fermenting material has been used, the moisture given off, combined with the occasional damping of paths and walls, will produce suitable atmospheric conditions for the present.

Some growers adopt the plan of fertilising their Peaches with a camel-hair pencil, others apply the syringe or a hive of bees; I give preference to the pencil, as the latter have disagreeable propensities. The foundation of a good set of fruit, however, depends more upon the work of the past autumn, and the present state of the roots, than upon detailed management at the time the trees are in flower. The cautious cultivator will of course adopt some method for securing his end, and I am doubtful if there is any plan better than the use of the brush on fine days, the ventilators being kept open as much as possible, unless the weather is very severe, with sufficient fire-heat to maintain a temperature of 50° by night to 60° by day, with a few degrees above or below these figures on bright days or severe nights. Succession houses that have been recently closed will require precisely the same treatment as that recommended for the early house; syringe freely on all favourable occasions, force with constant ventilation, and fumigate before the flowers open. *W. Coleman, Eastnor.*

PLANT HOUSES.

ORCHIDS.—Members of the Miltonia family should now be examined to see if any of the plants are in want of more root-room, as the present time is the proper season to repot them. *M. Clowesii* and *M. Regnellii*, both strong-growing species, are best grown in pots in equal parts of fibry peat and sphagnum. The pots should be at least two-thirds full of drainage. Keep the plants well elevated above the rim of the pot, with the base of the bulbs just touching the compost, so that the young breaks now pushing will be free from anything likely to rot them. Plants that do not require more root-room should have the surface of the old soil carefully picked out to the depth of an inch. The space thus made should be filled up with a layer of broken crocks and charcoal and a top-dressing of peat and sphagnum. A very important item towards success in growing these two Miltonias is to see that the numerous small roots now pushing from the last made growths are in no way injured or devoured by insects. The dwarf-growing *M. spectabilis* and *M. Moreliana* are best grown in pans, and as they extend themselves rapidly in every direction they require considerable rooting room. Old plants which have grown bare in the centre may now be broken up. All spent bulbs should be cut away and the growing pieces made up afresh. Those pieces which have but few roots to hold them steady must be pegged down to the compost, as they will never succeed if the least loose. With the peat and sphagnum use liberally small pieces of crocks and charcoal. *M. candida*, with its beautiful and rare variety, *grandiflora*, may be treated exactly the same as *M. Clowesii*, but a fortnight hence will be soon enough to repot it. The white-lipped *M. cuneata* must not be disturbed at the roots now, as its spikes will be far advanced. This plant is not so much grown as it deserves to be; its best form is certainly a first-class Orchid. The whole of the Miltonias mentioned will grow thoroughly well in a rather shady part of the intermediate-house. When grown in a very light position their foliage becomes far more yellow than is desirable. Frequent waterings must be given when throwing up their flowers; at all other times the compost should be kept moist.

Any plants of *Vanda cœrulea* which require more root-room should at once be seen to, for already a more rapid growth has commenced, and in a week or two young roots will be numerous. Nothing suits this plant better to grow in than an upright Teak rod cylinder. The rods should be kept at least half an inch apart, which will allow a free circulation of air amongst the roots, and for this *Vanda* should be about 15 inches long. The lower leaves of the plant need only just clear the tops of the rods, and with the exception of a thin layer of sphagnum at top, nothing more is necessary for the roots but crocks and charcoal. Plants that do not require more room must have all the old sphagnum picked out previous to being refurnished with fresh. Abundance of water must now be given at the roots. If at any time cock-

roaches or woodlice harbour in the cylinder, plunge it for a few minutes in water, when they will rise to the surface and may be easily destroyed.

The following species of *Calanthe*, namely, *C. veratrifolia*, *C. Masuca*, *C. Dominicana*, and all others of the evergreen section, will now be in the middle of their growing season, and will take frequent large supplies of water with an occasional dose of weak liquid manure. The members of this family are frequently troubled with brown scale, which must be kept under by sponging. A liberal shift should now be given to pot-bound plants of *Cypripedium Sedeni*, *C. Schlimii*, *C. purpuratum*, *C. Harrisianum*, *C. insigne*, and its varieties. The pots should be one-third full of drainage, secured by a layer of sphagnum. Lumps of peat mixed with a little sphagnum, and a moderate quantity of broken crocks and charcoal, will grow to perfection any of the above species. Water at all times of the year must be freely given. For the want of water and root-room many *Cypripediums* look anything but flourishing. Plants of *Zygopetalum maxillare* that have covered their blocks of Tree Fern stems, must now be seen to, as they will be starting into growth. We simply wire the old block on to a larger one, and the plant soon takes hold of the added portion. This *Zygopetalum* must never be in the least dry. So soon as *Z. Mackayi* and *Z. crinitum* pass out of flower let them be either repotted or top-dressed: fibry loam, and plenty of crocks and charcoal mixed with it, will suit either to root in.

Imported plants of *Lelia anceps* and *L. Dawsoni* should be potted at first in nothing but broken bits of crocks and charcoal. No water must be poured over the bulbs or rhizomes, or they will rot. Water once a week may be poured through the crocks to keep them moist, which will induce the plants to make fresh roots. The atmosphere immediately surrounding these imported plants should be well charged with moisture. Both plants require a light position in the Cattleya-house. Plants of *Dendrobium Ainsworthii*, *D. crepidatum*, *D. crystallinum*, *D. Boxallii*, *D. primuminum*, and others, which have pushed out their flower-buds, will now require a more generous treatment in every way to enable them to properly develop such buds. In every case get the plants well to the light in the East Indian-house, so that the colours of the flowers may be clear and rich. *J. C. Spyers, Burford Lodge, Dorking.*

TOWN GARDENING.

At the time of writing the weather is comparatively mild, and the ground in good working condition, so that such groundwork as altering walks, flower-beds, lawns, &c., may be pushed forward. Ground may also be levelled and turf re-laid or renewed, the best turf that I have found for the purpose being that on which sheep have grazed. Prune and train climbers on walls. Some of the best climbers that I have found to suit town are *Ampelopsis hederacea* and *Veitchii*, *Passiflora cœrulea*, *Rose Gloire de Dijon*, and *Wistaria sinensis*: these are on a south wall—the latter is a very shy bloomer here.

Of plants suitable for forming permanent edgings of flower-beds *Euonymus radicans variegatus* stands the best, and is the easiest kept in order. Next in rotation is *Euonymus flavescens* and *Euonymus japonicus variegatus*, but this has a tendency to go green; and *Euonymus latifolius variegatus*, which is rather tender.

In wintering *Echeverias*, the best mode of procedure with this succulent—invaluable for bedding purposes—is to make up a two or three light box, as the requirements may demand, and put 6 inches of drainage in the bottom in the following manner:—3 inches of brickbats, 3 inches crocks or clinkers, with a coating of rough soil on the top to keep the drainage open. Take the *Echeverias* up in the beginning of October, selecting a dry day for the purpose, take off all offsets, and shorten the stems a little; place them in close together, working a little gritty soil amongst them. Do not give them any water till spring, when take the opportunity of a bright sunny morning: water early so that they may get dry before night. Cover them up well at the approach of frost, and as soon as it is gone the covering should be taken off, and they should have all the light and air possible; if the covering is left on too long they become blanched, which makes them very tender, and when exposed to the air and light they often turn black. By this mode many hundreds may be wintered in a small space with very little trouble.

*Lobelia*s should now be brought into heat to start, and a hotbed be made up of leaves and manure for striking the cuttings; they strike far better with me here in a frame plunged in a hotbed, than in the regular propagating-house. Two of the best old sorts that I have found to suit here are *Lobelia speciosa* for a dark blue, and *Blue King* for a light blue, for ribbon borders. *Wm. Gibson, Royal Hospital Gardens, Chelsea, S.W.*

## APPOINTMENTS FOR THE ENSUING WEEK.

MONDAY,	Jan 19	Sale of Japan Lilies, Cape Bulbs, and Roots, at Tokenhouse Yard, by Frotheroe & Morris.
WEDNESDAY,	Jan. 21	
FRIDAY,	Jan. 23	Sale of Miscellaneous Stock, at Stevens' Rooms.
		Sale of Liliun auratum, &c., at Stevens' Rooms.

WE all of us know by observation, if not experience, the ill-effects produced by the abuse of fermented liquors. It will not be altogether surprising to learn that various diseases to which the human frame is liable are or are plausibly supposed to be due to some process of fermentation, or to the consequences thereby engendered. Less generally known is it that the process of digestion in animals, as also in the leaves of the so-called insectivorous plants, is accompanied by a similar phenomenon. But there are ferments and ferments, and the character of the changes they bring about varies according to their nature. The whole subject of fermentation is very complex, and just now of special interest and importance, not only from a purely scientific point of view, but also from the standpoint of practice. Thousands of people are ready to sneer at what they would consider the time wasted in observing Bacteria and fungi of microscopic minuteness, because from want of training they have never come to appreciate the value of knowledge for its own sake. Tens of thousands, however, would be able to appreciate the importance of such observations when it is made known to them that the knowledge so acquired is immediately available in the prevention and extinction of certain forms of disease. In surgical practice, for instance, no greater boon—not even the discovery of anaesthetics—has been conferred than that with which Mr. LISTER'S name is connected, and which is based simply on the prevention of the access to wounds after operations of those minute organisms which have, by his experiments and those of others, been proved to set up fermentation in the fluids of the body, and consequent fevers, pyæmia, and other more or less fatal complications. To have well-nigh abolished the ill-effects of these malignant visitors to the hospital wards is no mean result of what some might consider laborious trifling.

A pamphlet of Dr. HAGAN, Professor of Entomology in Harvard University, Cambridge, Mass., which was commented on by Mr. MCLACHLAN at the last meeting of the Scientific Committee, draws attention to another phase of the subject which has special interest for the gardener. Dr. HAGAN'S notion is, that obnoxious insects of all descriptions may be killed by the application of the yeast fungus. Every one must have observed unfortunate flies sticking to the window-panes in autumn and invested with a fine tuft of delicate cobweb-like threads. Those threads are the spawn of a fungus, which has caused the death of the fly by its rapid growth. The extremely minute spore, or, as we may popularly term it, seed, is deposited on or in the body of the fly, germinates therein, feeds on its substance, and speedily kills it. If, then, under what we may call natural circumstances flies may be killed by fungi, why may not flies and other creatures whose presence is undesirable be killed of set purpose by like agency? We need not enter into details as to the kinds of fungus alluded to in Dr. HAGAN'S pamphlet. There are doubts and conflicting statements as to this point. What is asserted

positively is that mould (or mildew) introduced into mash produces fermentation and the formation of a yeast fungus, which kills insects. A Prussian naturalist, Dr. BAIL, has, it seems, proved by numerous experiments that healthy insects brought into contact with mash and fed with it are directly infected, and with fatal consequences. A small drop of blood taken with the point of a needle from the body of a house fly so fed has been seen under the microscope to be teeming with spores of the fungus. Dr. HAGAN proposes to turn this to practical account by using beer mash, or diluted yeast, by means of a syringe or a sprinkler. Plants infested with greenfly, for instance, may be so treated. Nevertheless, says the Doctor, "I should not be astonished at all if the first trial with this remedy would not be very successful—even a failure. The quantity to be applied, and the manner of the application, can only be known by experiment, but I am sure that it will not be difficult to find out the right method. I myself have more confidence in the proposed remedy, since it is neither an hypothesis nor a conjecture, but simply the application of true and well observed facts." The Doctor adds a supplement to his paper, showing how various experimenters have tried the experiment, but we are bound to say with no great measure of success, amply sufficient, however, to justify further experiment. The application of diluted yeast to greenhouse pests is so easy that we may hope with Dr. HAGAN that numerous trials will be made, and that the remedy "may prove to be a great benefit to horticulturists." It seems like setting a thief to catch a thief, but it may be none the less effectual for that.

WHILE the seedsmen, owing to the defective harvest of 1879, are very properly recommending their customers to sow their seeds much more thickly than usual in consequence of many of them being imperfectly matured, it is well to caution gardeners of all degrees not to be too anxious to sow early. If the vitality of the seeds be of a less reliable character than is generally the case, it is obvious that, in order to give them as good a chance as possible of germinating in a satisfactory manner, that they be sown under conditions most favourable to this result.

There is a great, an almost feverish, anxiety with some gardeners to sow early. If we are favoured with a bright day or two in January there are thoughts of sowing Beans, Peas, Lettuces, &c. In cases where the soil is light, early, warm, and well-drained, sowing can be pretty safely done in January, provided the weather be suitable for the proper carrying out of this operation. If the soil be heavy, late, cold, and retentive of moisture, it is like courting failure to sow before Nature has had time to do her share in preparing the ground for the precious seed.

Many sowings of seeds made in the spring of 1879 perished because of the uncongenial character of the soil. Our misfortunes should teach us wisdom, and the lessons of failure should be to make the gardener careful—exercising the virtue of forethought, and waiting patiently till the conditions were most favourable to the well-being of the crops. It is all the more necessary these virtues be exhibited at a time when it is important to take more than ordinary care in sowing for the season on which we are now entering.

THE GARDENS AT BLAIZE CASTLE.—Today we give another illustration (fig. 18), from the pleasure grounds of Blaize Castle (see p. 49). The present view is of a dell with a pool in the centre, in which hardy aquatics are grown, and the surrounding banks clothed with suitable plants, interspersed in summer with Agaves, Yuccas, and others of like description, forming a cool and agreeable retreat. The gardens and pleasure grounds are well kept by Mr. LODER, who has been gardener and general

manager here for thirty-five years. He is an old Syon House-man, whose love and knowledge of his profession are such as to make his acquaintance most enjoyable, especially to those connected with the pursuit. The grounds, we understand, are open to visitors every Thursday by previous application to Mr. LODER. Those who visit the place should not leave without seeing the Henbury Cottages, built by the late Mr. HARFORD for his old servants and other deserving individuals with limited means. They are ten in number, all detached; their construction and the position they occupy is such as to give the whole a most picturesque, snug, and home-like appearance. They are very commodious, all or nearly all dissimilar, placed irregularly on a broad grassy slope well sheltered by trees, and by their arrangement there is a privacy secured not usual in dwellings of this description.

THE ISLAND OF SOCOTRA.—On Friday evening last, Professor BAYLEY BALFOUR left London *en route* for Aden, from which he hopes to reach Socotra, the exploration of the natural history of which has been entrusted to him by the committee of the British Association. Professor BAYLEY BALFOUR carries with him strong official recommendations to the Government of Aden, which is a dependency of India. He will have to rely on chance facilities for reaching the island, from which, however, he, with his collector and attendants, will be fetched away in April by the Assistant-Resident, Captain HUNTER (who sent the Somali *Dracena* and *Myrrh* plants to Kew), when he makes his accustomed visit in the Government steamer to pay the annual subsidy to the inhabitants, by which their adhesion to British interests is secured. The results of Professor BAYLEY BALFOUR'S mission are anticipated with much interest, as hardly anything is known of the natural history productions of the island, which the traveller HILDEBRAND failed to reach. The zoological collections will be deposited in the British Museum, while the botanical will be sent to Kew. Mr. ALEXANDER SCOTT, of the Edinburgh Royal Botanic Garden, who was strongly recommended by Mr. SADLER, accompanies the expedition as chief collector.

CEYLON: COFFEE-LEAF DISEASE.—Mr. H. MARSHALL WARD left London at the same time as Professor BAYLEY BALFOUR (whom he will accompany as far as Aden), *en route* for Ceylon, to take up his duties as cryptogamist, charged with the investigation of the Coffee-leaf disease. The departure of Dr. TRIMEN, the new director of the Royal Botanic Garden, Peradeniya, is necessarily postponed for a few days.

COFFEE-LEAF DISEASE.—We understand that the publication of the book which Mr. MORRIS has undertaken to write, for the Coffee Planters' Association, on the Coffee disease of Ceylon and Southern India may be shortly expected.

JAPANESE CURIOSITIES.—The main feature at the meeting of the Scientific Committee, on Tuesday last, consisted in the exhibition of a large and miscellaneous collection of objects collected in Japan by Mr. MARIES while travelling for Messrs. VEITCH. The room in which the objects were displayed was ill-adapted for the purpose, but it was understood that this was a private view for the special behoof of the committees, and that probably, in due time, a public exhibition under more favourable auspices will be made of the objects which have been got together by Mr. MARIES' industry and judgment. By the way, could not Messrs. VEITCH contrive to exhibit some from their rich stores of Japanese and other curiosities at one of the *conversazioni* of the Society, and so add a novel attraction for the Fellows? To show the interest and variety of Mr. MARIES' collection we may note the following particulars. The photographs gave a better idea of the beauties of Japanese landscape than any we have previously seen; the Japanese pictures were curious and excellent in more senses than one; the little tea-pots carved out of the rhizomes of the Bamboo into the form of *Nelumbium* flowers, &c., were tempting enough to make lovers of the curious break the tenth Commandment. The fans from Formosa consisted of sheaths of the Bamboo, on which were traced artistic designs with great freedom by means of a red-hot wire. We may say *en passant* that the large sheaths of *Dendrocalamus giganteus* grown at Syon House are utilised in like manner for

fans, designs being painted on them. Bow and arrows from Yesso, used by the aborigines (the Ainos); Japanese war-horn (a huge shell), used by the Daimio of Nanguoka; fossil from Ichang, China, called by the Chinese "pagoda" stone; snakes, various, collected in China and Japan; birds, collected above Hankow, on the Yang-tse river; insects, various, from North China and Japan; Millet (mountain), cultivated in Japan; square-stemmed Bamboo; stone hatchets found on Yokohama Bluff; land shells, China and Japan; hornets' nest, Japan; a Japanese nursery picture; Chinese passport for Formosa; Japanese pictures; recent Japanese botanical work; photographs of Japanese trees; fungi (various), in bottles. These form only a portion of the treasures

that careful experiment, with the most jealously strict regard to accuracy, will alone avail to bring out any reliable conclusion. The *Journal of the Royal Horticultural Society* would be rendered worthy of its name were we able to record on its pages such work as this, if undertaken and carried out in a truly scientific spirit. The title of F.R.H.S. would then cease to be, as in too many instances it is now, a *Vox et proterea nihil*.

— AUBRIETIAS. — No hardy plants appear to have stood the wet summer and the recent severe frosty weather better than the Aubrietia; in cold, wet, shaded spots, where no sunshine falls, and where the wintry winds play with unchecked violence, have

the Warwickshire Agricultural Society, held at Atherstone last year, in connection with which there was a display of horticultural produce, it was proposed that a meeting be called shortly to take into consideration the desirability of holding an annual horticultural exhibition in the town, as the one held in conjunction with the agricultural show was the first flower show which had been held in the town for twenty years, and was a decided success. From the statistics produced by the local secretary it appeared that there were nearly 700 entries for the horticultural department. The show was entirely got up by the local committee, and the whole management of the same devolved upon the floral committee and the local secretary. As an exhibition in itself it was

FIG. 18.—VIEW OF A DELL IN THE GROUNDS OF ELAIZE CASTLE. (SLE P. S.)

brought home by Mr. MARIES. His plants comprise numerous interesting and beautiful subjects, which will make their appearance in due time.

— IMPROVED POTATOS. — A well-known experimentalist asks—“Has it been proved by any competent experimentalist that the Potato can be ‘improved’ by selection from the tubers? For myself, I offer no opinion, having made no special investigation of the subject. Bud-variation is a known phenomenon, and the Potato tuber is a bud; the thing, therefore, is possible; but far more correct information than any we possess is needed to throw any real light on the subject. A new year lies before us, and it would be well if a few of the rising young Fellows of the Royal Horticultural Society (and old ones, too, for that matter) would take up such subjects as these and work them out, remembering, however,

been seen large and luxuriant tufts of Aubrietias grown from quite small slips planted out in a stiff soil last winter, that are perfect as hardy foliaged plants. In addition to its possession of the quality of endurance, we have nothing like it for early spring work in our gardens; it is quite distinct in aspect and hue from anything else found there, and rarely perishing from those causes which will destroy numberless other plants. Whether it be the cold and wet of winter, or the heat and drought of summer, it is equally tenacious of existence; and it is almost one of the earliest to bloom, putting forth its flowers ere winter has relinquished the reins of government of the elements.

— PROPOSED HORTICULTURAL EXHIBITION AT ATHERSTONE. — At the final meeting of the local committee formed for carrying out the exhibition of

superior to any previously held in connection with the Society, and it is to be hoped that it will be found practicable to hold an annual exhibition which might with advantage be held in connection with a show of dairy produce and a bee show.

— FRUITING OF YUCCAS. — The good offices of the moth (*Pronuba Yuccasella*), at one time considered essential to the fertilisation of these plants, would seem to be by no means always necessary. Mr. VAN VOLXEM tells us that in Rome some twenty years ago he observed numerous candelabra of dry pods on some of the Yuccas, and, amongst others, on those of *Y. aloifolia* fol. var. From the latter he procured seeds, all of which, however, produced green-leaved seedlings. In Mr. HANBURY'S garden at La Mortola, near Ventimiglia, in 1877, several species fruited. The pulp around the seeds has a

rather agreeable sweet taste. It seems clear, then, that although the *Pronuba* does sometimes act as a match-maker, her mediation is not always required.

— A MIDLAND COUNTIES BEE-KEEPERS' ASSOCIATION has been formed under distinguished patronage, for the encouragement, improvement, and advancement of bee culture, particularly as a means of bettering the condition of cottagers, agricultural and labouring classes, as well as the advocacy of humanity to that most industrious of labourers—the honey bee. Mr. JAMES NOBLE BOWER, of Knowle, near Birmingham, has kindly consented to act as honorary secretary.

— TWIN-FLOWERED EUCHARIS are not uncommon, but we have rarely seen so perfect an example as one sent us by Messrs. KER, of Liverpool, who received it from Mr. DELAMERE, of Bootle. Messrs. KER tell us it is the third flower produced by the plant, so that there is some hope that the sport may be perpetuated.

— THE SEED TRADE.—From Messrs. W. H. & H. LE MAY'S Circular we learn that—"Owing to the unfavourable weather which prevailed throughout England last summer, there is an entire absence of new home-grown seeds; but, fortunately for consumers, there is a fair stock of sound yearling English seeds in the hands of merchants and speculators. These remarks apply equally to red and white Clovers, Trefails, and grasses. The crop of red Clover in America is above the average and of fine quality, and in consequence of the rise in prices, owing to speculative demand induced by the failure of the English crop, large shipments have been made to this market. In Germany red Clover is a fair average as regards both quantity and quality, but of white and Alsike the crop is very small and the quality poor, owing to the heavy rains. In France the crop of red Clover is somewhat below the average in quantity and of poor quality. Trefail is not more than half a crop, and the quality is poor; Italian Rye-grass yields an average crop of fine quality. The crop of grasses in Scotland and Ireland is considerably below the average in quantity and weight per bushel, but there is a fair amount of heavy seeds still on hand from last year. Taking all things into consideration, it is our opinion that the present prices will not be exceeded if buyers will restrict their purchases to their immediate requirements."

— THE RAINFALL IN NORTHUMBERLAND.—Mr. DAVID INGLIS, Howick Gardens, Jesbury, Northumberland, sends us the following details of the rainfall at that place in 1879:—Jan., 1.59 inch; Feb., 3.55 inches; March, 0.84 inch; April, 2.15 inches; May, 2.73 inches; June, 3.80 inches; July, 5.56 inches; Aug., 3.63 inches; Sept., 0.86 inch; Oct., 0.91 inch; Nov., 3.06 inches; Dec., 1.14 inch—the total depth for the year being 29.82 inches. In twenty-four hours was on July 21, and the greatest fall in twelve days has been for the last forty years. Howick Gardens are about one mile from the sea, and 130 feet above sea level, consequently much damage from frost is never experienced.

— JAPANESE PLANTS.—In the list of Japanese plants and bulbs introduced by Mr. FORTUNE, which we published at p. 11, there is an important omission, *i.e.*, *Primula japonica* and its varieties, which we now supply.

— THE WOOD TRADE.—Messrs. CHURCHILL & SIMS state in their Circular that "The wood market has participated in the general improvement in the trade of the country which made itself evident in the closing months of 1879. The importation into the United Kingdom, which had fallen off considerably in 1878, shows a still further reduction in 1879, the import having been little more than two-thirds of that of 1877. It should be noted that the London railway sleeper import has been 90,000 loads less than that of 1878; making allowance for this, it will be seen that the arrivals of wood into London for general purposes have exceeded those of any previous year except 1877. The demand, however, has been fully equal to the supply, and the stocks, although considerable, are not in excess of the probable require-

ments of the trade during the months in which the shipping ports will be closed. While the importation and consumption of the United Kingdom have been declining, the wood trade of London has been increasing. This increase is due not merely to a larger local demand—the port of London continues to grow in favour both with the importer by reason of the excellent dock accommodation it possesses for the storage of stocks, and with the shipowner by reason of the facilities it affords for the rapid discharge of his vessels, which, now that steamers are so freely employed in the trade, becomes a more important consideration than ever."

— DATE PALM WINE.—As is well known, a kind of wine or toddy is procured from many of the Palms, notably the Palmyra (*Borassus flabelliformis*), and the Cocoa-nut (*Cocos nucifera*). From the Date Palm, which is most valued for its fruits, only comparatively small quantities of wine are obtained. In some notes on the Date Palms cultivated in the oasis of Laghouat in Africa, it is stated that Palm wine (the "lakmi" of the Arabs) is furnished by trees which must be at least forty years old, or in full vigour. If the Palm is very old and about to be sacrificed the terminal bunch is cut, but if it is intended to preserve the tree, a circular incision is made below the terminal bunch, which is carefully preserved; the fluid is conducted by means of a reed to an earthen pot. The yield is from seven to eight litres of wine daily. At the end of a month, which period is seldom exceeded so as not to enfeeble the tree, only about three or four litres are obtained. The collection being terminated, the incision is carefully closed with clay or earth. The Palm thus treated and well irrigated will furnish Dates again in two years, and sometimes in the following year. The Arabs of the South use large quantities of palm wine, collecting it daily as a fresh drink. The bottles employed by the Arabs are of thin glass, the corks are tied down with string, upon cutting which they fly out, and the wine effervesces like champagne. Its colour is opalescent and rather milky. The odour is slightly exciting, and its taste at first is very agreeable, and somewhat resembles bottled or sparkling cider. When, however, the wine has lost its carbonic acid it has an insipid flavour. After being two months in bottle the wine appears not to undergo any material change. Its density is the same, but its acidity is rather more marked.

— THE SHOW-HOUSE AT KEW.—We believe that the present unsatisfactory state of the decorative and purely horticultural department of the Royal Gardens, is nowhere felt more keenly than by the officers at Kew. Something, and indeed a good deal, must be credited to the prolonged repairs to which the houses were subjected last summer owing to the hailstorm, and other causes already referred to in our columns. The organisation of so vast an establishment, dealing with such different and so diverse interests, presents great difficulties in keeping every part up to a uniform standard. We have reason, however, to think that changes have been already in contemplation, which will tend to bring the horticultural department up to the same level of excellence, as is generally admitted to have been reached in the case of the other plant collections.

— BARKERIA CYCLOTELLA.—This Orchid, which proved so attractive to the *agrostis* on Tuesday last, must, as it would seem, be equally or more attractive to certain insects. In any case, on the lip is a reddish-violet spot the size of a fourpenny piece, and pressed down close to it is the column bearing the anther. Any insect alighting on the flower would be attracted and guided by the patch of colour, and in its attempt to get at the honey in the spur must needs lift up the anther so as to squeeze himself in, and, in so doing, inevitably remove the pollen masses. The cut on p. 72 will show this arrangement.

— DASYLIRION GLAUCUM.—At Handcross Park, Crawley, Sussex, the fine seat of J. WARREN, Esq., a handsome specimen of this well known exhibition plant is now in flower in a house devoted to Agaves, Bonaparteas, and other succulent plants. The flower-spike is 10 feet high, and in general appearance is not unlike a gigantic spike of *Celosia pyramidalis*, but less feathery, and of an indescribable silvery-grey colour. The plant flowers so seldom in

this country, that we hope shortly to give its portrait.

— EVERGREEN PEACHES.—Some trees this winter seem to justify such an epithet, as, even after all the frost we have experienced, the leaves of some varieties still remain unharmed on the tree. We noticed this at Mr. CUTBUSH'S nursery at Highgate lately, and now Mr. BUNN, gardener at Hanger Hill, near Ealing, sends us a number of leaves as green as in September.

— JERUSALEM ARTICHOKE.—It has been noticed this season that the lifted tubers of Jerusalem Artichokes are large, much knotted, and uncouth in appearance. This is mainly owing, perhaps, to the wet season, which caused an unwonted growth in the foliage of these Artichokes, and caused them to take on an ugly and ill-shaped appearance, much as Potatoes do when strongly grown. Those who grow the Artichoke for market purposes plant it in a stiff loam, and the excessive wet of the summer, causing the soil to run together, interfered to some extent with the regular swelling of the tubers. Some say they are more watery than usual when cooked, which is perhaps another result of the wet summer. An old gardener of many years' practice asserts that while the Jerusalem Artichoke will grow in almost any soil and situation, to have fine roots it should be planted in a rich mellow loam, in an open airy part of the garden. Now-a-days gardeners plant this esculent in an out-of-the-way part of the garden, as if it were of no account or of but little value. It is a very prolific plant, and from a small piece of ground a considerable supply can be drawn if the soil be suitable and some attention is given to the cultivation of it. The crop should be lifted in November when the stalks are quite withered, and the roots laid by in dry sand or housed as Potatoes for use during the winter. If it is desired to discontinue the bed every tuber should be diligently searched for, or they will surely grow if left undiscovered in the ground.

— TRANSPORT OF SEEDS IN THE TIME OF LINNÆUS.—The conveyance of seeds uninjured through adverse climates is still imperfectly understood, though it is now known that many seeds may be safely transmitted in earth which is neither too moist nor too dry. This was the chief difficulty encountered by the early introducers of exotic plants. In looking over some of LINNÆUS'S correspondence we find frequent allusion to the various contrivances for packing seeds so that they should retain vitality. JOHN ELLIS, F.R.S., who was the first to demonstrate the animal nature of corals, tried a number of experiments in preserving the germinative power of seeds during long voyages. In one of his letters to LINNÆUS he says:—"I am now smearing over the acorns of the *Quercus* that bears the cork with a thick solution of gum arabic, which soon dries; others I cover with wax, others I enclose in clay and gum arabic; each acorn is covered or smeared singly. I shall enclose others in clay and tow, or flax, worked up together and then dried. Others I cover with a mummy made of pitch, resin, and bee's-wax, in equal quantities. They are afterwards put into jars, some in sand and some in paper, and some in boxes, and then covered up close and kept cool on board ship. This is the method I propose to bring seeds from China; and am now trying the experiment only for a short voyage to Charleston, South Carolina, to Dr. GARDEN." Replying to this LINNÆUS informs ELLIS that "Fresh seeds may with great facility be conveyed in the following manner from any distant country. Fill a glass vessel with seeds, so deposited in dry sand as not to touch each other, that they may freely perspire through the sand, tying a bladder or piece of paper over the mouth of the vessel. This glass must be placed in one of larger dimensions, the intermediate space of about 2 inches all round being quite filled with three-parts nitre, one of common sea-salt, and two of sal-ammoniac, all powdered and mixed together, but not dried. This mixture will produce a constant moisture, so as to prevent any injury to the seeds from external heat; as has been proved by experience." This method may have answered in some cases, but it did not meet with ELLIS'S approval. In another letter ELLIS states that he had succeeded in raising a number of acorns of the English Oak, which had been preserved in bee's-wax fourteen months. These acorns were put into an earthen vessel, into which the melted wax had first been poured, and before it was hardened the

acorns were put in; being first well dried on the floor of an airy room for a month. Tea seeds, however, that had been enclosed in a coating of wax half an inch thick, failed to germinate after the voyage from China. Subsequently ELLIS was successful in raising many imported seeds of the Tea plant and various other plants, which had been preserved in wax. He found this was the best substance to preserve the vitality of seeds. ELLIS used to send his seeds to AITON at Kew.

— ORCHIDS IN FLOWER.—The following Orchids are now in flower at Messrs. JAMES VEITCH & SONS', Royal Exotic Nursery, King's Road, Chelsea:—

Calanthe nivalis	Lycaste Skinneri
" Turneri	Masdevallia polysticta
" Veitchii x	" tovarensis
" vestita	Maxillaria grandiflora
" lutea	Odontoglossum Alexandræ
Chysis Chelsoni x	" Andersonianum
Cœlogyne cristata	" cordatum
Colax jugosus	" blandum
Cypripedium barbatum	" cirrhosum
" Boxallii	" grande
" albo-purpureum x	" Pescatorei
" Dayanum	" Roezlii
" Harrisianum x	" album
" Haynaldianum	" tripudians
" insigne	" Londe-boroughianum
" Sedeni x	Ocuidium bicalliosum
" selligerum x	" cheoporum
" venustum	" divaricatum
" vexillatum x	" Forbesii
" villosum	" obryzatum
Cattleya Trianae	Phalenopsis amabilis
Dendrobium endochaitis x	" Schilleriana
" form sum	Pleione humilis
" noble	Restrepia antennifera
" Wardianum	Saccolabium giganteum
Dendrochilum glutaceum	Sophranetes grandiflora
Laelia alba	Zygopetalum Mackayi
" elegans alba	

— TEMPERATURES REGISTERED IN EDINBURGH.—The following is an abstract of a report on the lowest temperatures registered at the Royal Botanic Garden, Edinburgh, from December 1, 1879, to January 8, 1880, by Mr. JOHN SADLER, Curator. During December last the thermometer was at or below the freezing point twenty-three times, and there were registered collectively during the month 230° of frost. From the 1st till the 13th there was hard frost every night. On the 4th the thermometer stood at 1°, or 31° of frost, and on the 13th at 28°, or 4° of frost. On eight mornings during the month there was no frost, although the temperatures were not high. On the 25th the register was 35°, while on the 26th it was 20°, or 12° of frost. In December, 1878, there were registered 265° of frost for the month, and the thermometer was at or below freezing point twenty-nine times, the lowest temperature being on the 14th, when 23° of frost were registered. Since this year began there have been only 2° of frost. The following have been the lowest readings:—January 1, 32°; 2d, 37°; 3d, 34°; 4th, 39°; 5th, 41°; 6th, 43°; 7th, 36°; 8th, 30°, or 2° of frost. The thermometer during the day frequently ranged from 42 to 52, but although the weather has been extremely mild for the season, spring vegetation has made no start as yet, which is to be accounted for by the decided check it received at the beginning of last month. Christmas Roses (*Helleborus niger grandiflorus*) are at present in fine flower on the rock garden, along with *Crocus medius*. In conclusion, says Mr. SADLER, let me express the hope that the present mild weather is the ushering in of that extraordinary "wave of solar heat" predicted by the Astronomer Royal for Scotland in 1872, to begin this year.

— SCIENTIFIC SERIALS.—Under the auspices of the Harvard University, Cambridge, U.S., Mr. SAMUEL H. SCUDDER has compiled a most useful work, a work indispensable to all persons engaged in scientific pursuits. From a small beginning it developed into a *Catalogue of Scientific Serials of all Countries, including the Transactions of Learned Societies in the Natural, Physical, and Mathematical Sciences*, 1633 to 1876. It forms a large octavo of 350 pages, or rather of 700 pages, for the paper is printed on one side only, thus making provision for additions. Serials devoted to pharmacy, agriculture, horticulture, manufactures, philology, &c., have not been admitted. The plan of the catalogue is geographical. Thus, first international, then Great Britain and Ireland, and so on, concluding with the United States of America and British America. Under each of these heads the serials are enumerated under the names of the places where they are or were published; the names of the places being in alphabetical

order. Cross references are given to the locations and titles of societies; and there is an index of titles. The total number of serials enumerated is 4390. We have roughly calculated the numbers enumerated under each heading, and we reproduce them here as they may interest some of our readers. Of course the actual number of scientific serials published in a country affords only an approximate idea of the scientific activity of the population of the country in question, inasmuch as the serial publications of certain important societies outweigh a legion of serials of short duration. The numbers are:—

International .. .. .	18
Great Britain and Ireland .. .. .	559
Denmark, Sweden, and Norway .. .. .	151
Holland .. .. .	248
Belgium .. .. .	57
France .. .. .	715
Spain and Portugal .. .. .	72
Italy .. .. .	333
Switzerland .. .. .	193
Germany .. .. .	1128
Austria and Hungary .. .. .	368
Russia .. .. .	107
Greece and Roumania .. .. .	7
Asia, south of Russian Dominions .. .. .	50
Australia, Tasmania, and New Zealand .. .. .	37
Africa .. .. .	9
South America, Mexico, and the West Indies .. .. .	64
United States of America .. .. .	427
British America .. .. .	27

From the above figures it will be seen that the German serials constitute more than a quarter of the total, and outnumber the whole of those published in the English language.

— AROIDS AT SCHONBRUNN.—From the *Botanische Zeitung* we learn that there are nearly 300 Aroids at present under cultivation in the Imperial gardens of Schonbrunn, Austria.

— THE ROYAL JERSEY AGRICULTURAL AND HORTICULTURAL SOCIETY.—The spring show of this Society will be held on May 12; the Rose show on June 23; the summer show on August 11; the fruit show on October 13; and the Chrysanthemum show on November 17.

— GROWERS OF MARKET PRODUCE.—"Unitas" writes:—"As you have inserted the complaints of market gardeners will you allow me to request all persons interested in the matter to write a few lines, addressed to The Vineyard, Newport, Isle of Wight, in order that a meeting of market gardeners may be called through the medium of the Press, for the purpose of coming to some arrangement, which will bring us into direct contact with the consumer, and enable us to get the profits which ought to go into the pocket of the producer? With this object, I invite every market gardener to address a few lines to 'Unitas,' simply stating his desire to assist in the formation of a Market Gardeners' Association. If this appeal is sufficiently answered, I see no reason, unless something unforeseen occurs, why we should not be in working order before the spring produce comes in, and to a great extent independent of the delays and disappointments of Covent Garden."

— THE WEATHER.—General remarks on the weather during the week ending January 12, 1880, issued by the Meteorological Office, London:—The weather during this period has been very dry generally, but exceedingly dull and gloomy over England, rather so in Ireland, and at times in Scotland also. The temperature was slightly above the mean in Ireland and the greater part of Scotland, but as much as 4° or 5° below the mean in nearly all other districts. In most places the highest of the maximum readings occurred at the commencement of the period, and the lowest of the minima at its close. The wind was generally anticyclonic—being light from E. and S.E. in the S., light to moderate or fresh from S. and S.W. in the W., and light to moderate from S.W. and W. in the N. At our central and eastern stations calms and variable airs were experienced. The rainfall was exceedingly slight in all districts.

— GARDENING APPOINTMENTS.—MR. WM. ROBINSON, late Foreman at The Dell, near Windsor, has been appointed Gardener to L. D. HALL, Esq., Farnham Chase, near Slough, Bucks.—MR. HATCHER, late foreman to Mr. CLAYTON, at Grimston Hall, Tadcaster, has been appointed Gardener at Dobroyd Castle, Todmorden, which place belongs to the same proprietor, JOHN FIELDEN, Esq.

HARDY FRUITS.

HAVING touched on Apples and Pears, and given a list of the best varieties suitable for amateurs and others to plant, it now remains to treat shortly on Plums, Cherries, Raspberries, Gooseberries, and Currants, none of which are grown to anything like the extent in small gardens they might be were they only so arranged as to make the most of the room and cultivated in a systematic manner. Instead however of this being done it frequently happens that trees and bushes are planted and left to run riot and grow unrestrained till they become mere thickets, impenetrable to sun and air, and without these indispensable factors, fruit, if it shows, cannot ripen properly, and must therefore be deficient in those attributes that make it worth having. It is often said that our neighbours across the Channel manage certain things better than we do, and in the matter of fruit culture we might certainly take useful lessons, as there they plant by the wayside and utilise every spare nook, the result of which is that the population obtain abundant supplies of an article of food conducive to their health and well-being, while here it is at a forbidden price, and thousands of people in every town scarcely know the taste of it. Much of this scarcity arises from the well-to-do buying it instead of growing it for themselves, and from the insecure holding cottagers have of their houses, which debars them from planting even could they afford and were disposed to do so, as on removal they have to leave trees and bushes behind for the benefit of others without any recompense.

If landlords would only give the cottage part of their property more attention, and stock the gardens, what a boon they would confer, especially if they allowed more land that might be devoted to vegetables, as the two crops combined would not only provide better for the tenant's family, but the sale of the surplus would supply the very produce that is so much needed in our half-famished towns, and yield the grower wherewithal to pay his rent. We hear of the agricultural interest being at a low ebb through the low price of corn, and of farms being given up in consequence, and if this depression in that branch of industry should lead to portions of fields being added to labourers' gardens, there will be truth in the old adage that good comes out of evil, for besides the increased supply of produce so much required, men would have home interests and occupation for their children's leisure hours. To become useful members of society there is nothing like early training, as habits acquired in youth stick to us through life, and it is therefore a matter of the greatest importance that they should be of the right kind, instead of such as lead to waste of means and time at public resorts.

PLUMS.

Leaving this part of the subject, however, for abler pens than mine to plead, I return to the point at which I started, and would remark that, in the choice of PLUMS it is necessary to divide them into two classes—the one for walls, and the other to be grown as bushes or pyramids. The latter mode of culture suits very well for the culinary sorts, but those used for dessert require a better climate—at least, that portion of them which ripen late, and one of the very best of these is Coe's Golden Drop, a Plum that should be in every garden. To grow it to perfection it should have a warm, sunny aspect facing south-east or south-west, where in the autumn its fruit colours up splendidly, and if allowed to hang till it just begins to shrivel it is a perfect sweetmeat. In favoured districts this variety likewise does very well as a standard, and as it comes late in that way is often most valuable to afford a succession, and to yield a supply for cooking when others are done. Another grand-looking Plum, and one of first-class flavour, is the Jefferson, and if I were only to grow one kind this would be it, as it is good at all points, and makes a most tempting-looking dish on a table, where its large size and fine rich colour are sure to attract notice. Besides being so noble in appearance, it is a very free-bearing variety, and succeeds well on a wall, having a similar aspect to the one above-named. To come in just before this I would strongly recommend Kirke's, a Plum which, when ripe, carries a beautiful blue-black bloom, the fruit being round, and of large size and most delicious flavour.

If space can be afforded for other kinds, one of the most desirable is Reine Claude de Bavay, and it is quite a sufficient recommendation to this to say

that it is in look and quality a late variety of Green Gage. Of course, this latter must not be forgotten, as who would be without a tree of such an old favourite?—and, although it does fairly well as a bush or pyramid, the fruit is much finer on walls, as there it comes larger, and colours up splendidly on the side next the sun. Excepting Reine Claude Violette, those mentioned are all that any one, even with the largest garden, need care about to grow for dessert, as they ripen at different times throughout the season, and are the very pick of the sorts known, and such as are sure to give satisfaction to any one that may plant them.

Among those for culinary use the Victoria stands first, and this is the one for Villa gardeners and cottagers to plant, as it may be depended on, if the season is anything at all favourable, to bear enormous crops. So free is it in this respect, that I have seen trees weighed down to such a degree that they had to be propped up to prevent the branches from splitting or breaking off; and another recommendation for this particular kind is, that it is a good market fruit, for, being somewhat dry in the flesh, it bears handling well without becoming bruised or damaged in the way those that are softer and more juicy do. Prince Engelbert is another excellent kitchen Plum, that should be largely planted for market purposes, and to grow for preserves. Belle de Septembre is a most valuable late variety, coming into use after the forenamed are over. This is likewise known under the name of Autumn Beauty, and is much grown in the neighbourhood of London, where it is held in high esteem both for its good looks and high quality. These and Early Prolific constitute the best, and will afford a continuous supply the whole season through. Where people make mistakes is in planting too many kinds; instead of doing which, it is far better to keep to such as are known and well tried, for to go beyond this entails loss of time and much disappointment in the end.

**METHOD OF CULTIVATION.**—Plums succeed well in almost any kind of soil, but do best in that which is somewhat inclined to stiffness, or has a cool bottom. In cases where standards are planted, the right way to treat them is to simply thin out any branches which cross each other or become crowded, that the full influence of light and air may be let in on the remainder; and if this is attended to every autumn they will require nothing else, except perhaps the reduction of the ends of the leading shoots, should the trees grow strong and appear likely to become too large for their position.

In small gardens bushes and pyramids are preferable, and these are modes of training and culture to which the Plum is very amenable. When trained and treated in this way, they may be kept to almost any size desired by simply pinching or stopping the young shoots during the summer, which manipulation, getting rid of this woody growth as it does, induces the growth of spurs that bristle with fruit-buds. Should the soil be too good, and the trees prove unruly on that account, the strong tendency is easily rectified and checked by judicious root-pruning, an operation that should be taken in hand as soon as the leaves fall, as then fresh fibres are formed before winter sets in. Plums, like all other fruit-trees, pay for good attention at first starting, and therefore in planting it is advisable to dig large holes, and to give each plant a barrowload or two of fresh turfy loam, which will push them into bearing size quick; and, to get them to this desirable stage as soon as possible, they should be left to grow pretty much at their will, as to cut back causes loss of time, and leads to no good result; and yet many are very free with the use of the knife when they get young trees home from the nursery. Heading them in then or after is the greatest mistake possible, as they will always break back, and the thumb and finger can be made to do all that is necessary in the summer by removing any misplaced shoot, or nipping out the points of such as appear to be taking the lead.

In growing Plums near towns or buildings, such as farms, the trees require close watching, as sparrows strip them of their buds, and being birds with which we are so familiar, their depredations are seldom noticed or thought of, and many go on year after year blaming the seasons for the loss of fruit instead of these culprits. Being so exceedingly bold, to keep them off is a very difficult matter, but as these hard-billed birds are more a plague than a blessing, the

remedy I would suggest is to get rid of the greater portion of them by catching or shooting them when in flocks on the ground, where they may be decoyed by a train of corn when the weather is sharp. Those who may feel indisposed to adopt such means can only escape the loss of a crop by protecting the buds in some way, a good plan of doing which is to syringe the trees with limewash, as that not only renders them safe from the ravages of feathered depredators, but cleanses them from moss and lichen, so injurious to the health of the bark.

#### CHERRIES.

Like Plums, these succeed in almost any soil, but do best in a free sandy loam where the drainage is good. Unless the trees can be grown on walls so as to be protected in front by a good net it is almost useless attempting their culture, so fond are birds of the fruit. The best kinds for dessert are the Elton, Bigarreau, Knight's Early Black, and Black Eagle, the former of which is very fine and delicious. For tarts there are none to equal the old Mayduke, and to succeed this the Morello is held in great esteem. This kind will grow on any north aspect and makes handsome bushes, but, as observed above, the difficulty is to preserve the fruit. Where many are required no doubt it would pay well to make compact plantations with late Gooseberries between, and net the whole in; and the same with the dessert sorts, if treated as pyramids. By pinching these latter in so as to form plenty of spurs they are very fertile, but Morellos should be allowed to make their young wood full length and kept thinned out.

#### GOOSEBERRIES AND CURRANTS.

Bush-fruit of this character may be most economically grown by planting them in rows near the margins of walks, to which they make good boundaries and are easy to get at for the purpose of gathering. In the majority of cases, bushes of these are left till they get much too old, and are not sufficiently thinned out at pruning time to bear good crops of well-flavoured fruit. Bad as the sparrows are for denuding Plums of their buds, they are even worse among Gooseberries, which they often completely strip, beginning their attacks just as the buds are on the move, when the ground may often be seen strewn with the parts they reject. The best flavoured and most choice kinds are as follows:—*Reds*: Highlander, Crown Bob, Wonderful, Slaughterman, and Rifleman; Warrington is valuable on account of its late keeping qualities, as it will hang after all others are over. *Whites*: Whitesmith, Queen of Trumps, Snowdrift, Antagonist, Lady Leicester, and Hero of the Nile. *Greens*: Telegraph, Gretna Green, Haspool, Keepsake, Shiner, and Matchless. *Yellows*: High Sheriff, Mount Pleasant, Leader, Criterion, Leveller, and Catherina. Among Currants the red and white Dutch are as good as any, and Lee's Perpetual is the best among blacks. Black Currants delight in a damp situation, and where they can be so accommodated the berries swell to a very large size, and the bushes grow vigorously. In the pruning and management of these they should be simply thinned out in the autumn, and not spurred or shortened back in any way like the others.

#### RASPBERRIES.

These, too, like partial shade and moisture, and in the culture of these the ground cannot well be too loose and open, their nature being to spread their rootlets near the surface, where they are much benefited by annual top-dressings of manure, which if forked in at all should only be done to a slight extent, so as not to cause any disturbance. Raspberries are therefore best grown in quarters by themselves where they can have wires run along the rows for their support, which in the end is cheaper than stakes, that soon decay and require constant renewal. Where wires are not used the next best things are iron rods, as these, although dear in the first place, are everlasting. To afford Raspberries room, they should be planted 4 feet apart on fresh trenched land, and the rods cut back to near the surface of the ground the first year instead of making any attempt at taking a crop, which only weakens them without giving an adequate return. For general purposes there are none equal to Fastolf, which is large, prolific, and excellent in flavour. The White Antwerp is quite worth growing to afford variety on the dessert table, and the October Red for getting a supply for tarts in the autumn. This variety should

be planted in a warm sunny spot, and cut quite down every year, as the fruit is borne at the points of the young shoots that grow during the summer; when to get them strong the ground under them should be heavily mulched.

#### STRAWBERRIES.

No fruit is more popular, and no plants are more accommodating in their nature, for although they succeed far best in heavy soil, good crops may be obtained by skilful cultivation in just the opposite; but in such cases the plants are short-lived, and require treating almost like annuals, that is, as regards renewal, the crowns if left coming weak and too small to flower. Those who happen to have such a light hungry soil to deal with will find that it can be greatly improved by trenching in a good dressing of clay or marl with the manure, which buried in that way is very retentive of moisture, and therefore a wonderful help to plants when the weather is hot, as then they drive their roots down and search it out, threading it through and through. Amateurs and others not having had much experience in gardening often allow their Strawberry beds to become completely overrun instead of keeping the crowns separate and confining them to rows about 2 feet apart, which is the only way really fine fruit can be obtained, as then it has full exposure and the benefit of the sun, under whose influence it colours up and acquires its proper flavour. When the plants run together in masses they become mere weeds, and are not strong enough to bear a crop that is worth having, the berries being small and inferior in quality. I have seen excellent beds made by pulling old plants to pieces and using the strongest crowns, planting the same triangularly, three in a clump, at from 2 feet to 2 feet 6 inches apart; and if this is done early in August during a showery time they soon become established and bear well the following year. For getting a fine plantation quick there are none equal for the purpose of forming it to those in pots that have been forced which, turned out and kept well watered, bear enormously the next season, and are just the thing for forming beds on light lands where there is a difficulty in getting young runners to grow. Although the soil for Strawberries should be stirred deeply, it is important that it be well trodden and made firm after, otherwise they go too much to leaf, and do not make such full, fine crowns, that alone yield an abundance of blossoms. The practice of denuding Strawberries of their foliage in the autumn, as is often done, is a very barbarous one, and weakens the plants much, besides leaving them without their natural protection, which they stand so much in need of during the winter and spring. To ward off frost it is a good plan to give a heavy mulching of short manure at this season, which will likewise be a great aid in stimulating surface-roots, and sheltering the same from sudden changes of weather. As to sorts, British Queen is one of the best where it succeeds, and next in point of merit are Dr. Hogg, Sir J. Paxton, and Mr. Radelyffe, which partake of the character of the first-named. Keens' Seedling is superior to any of the earlier sorts, and Vicomtesse Hericart de Thury and President are the best to succeed it. For late supply the Elton should be grown, and this is the only one that makes really fine preserve, as its firmness of flesh, fine colour, and sub-acid flavour, render it particularly adapted for this purpose. F. S.

## VEGETATION AND PRODUCTS IN PUERTO RICO.

IN a very interesting account of the aborigines of Puerto Rico the following fairy-like description of the country is given. "It is not easy," the writer says, "to imagine a more lovely country, or one to which Nature has been more bountiful. Indeed, it is almost impossible to describe the varied scenery of some of the mountain passes in this island, especially early in the morning, when the grey mist lies like a sheet of snow in the valley, and gradually disappears under the rays of the rising sun. One rides through groves of trees laden with golden Oranges and Bananas, to be had for the gathering. Rich pasture lands, studded here and there with beautiful Palms and Cocoa-nut trees, extend to the horizon, wherein the fat cattle are almost hidden by the luxuriant grass upon which they are grazing; Convulvuli and other pretty wild flowers of a hundred hues literally line one's path.

Coffee plants covered with their delicious white blossom, and gently shaded by the larger trees under which they thrive, offer a tempting shelter when the sun's rays become too warm. Rich plants of Tobacco promise future hours of solace to the smoker as he lights his native weed; while vast fields of Sugar-cane serve to vary the shade of the verdure of the plains. Here and there a stray child, destitute of clothing, and wanting none as far as the climate is concerned, escapes from a picturesque hut of Palm leaves to complete the charm of the scene, and to carry one back to the period of the Boringuens; but the smoke issuing from the tall chimney on the distant sugar plantation destroys the illusion, and the cruel negro oxen-driver who goads his overlaiden bulls with nearly half an inch of sharp steel at the end of a long pole, serves to remind one that it is no longer the Boringuen who is the possessor of the soil."

Regarding the commercial products of the island sugar forms the staple article. There are at present 385 estates and plantations of all kinds. The majority of the large sugar plantations use mills worked by steam machinery, which is for the most part of British manufacture. A few mills are worked by water-power, and on the smaller properties mills worked by oxen are still in use. There are five establishments where the most improved plant and apparatus are in operation for the manufacture of sugar; one of these in particular is on a large scale, complete in every respect, and is equal to the working up of 30 tons of sugar per day. In the central factory a system of railway is employed for the conveyance of the canes to the works and for the carriage of the sugar to the port, which is giving very satisfactory results in regard to the reduction of the cost of labour. In this and another establishment the triple-effect machinery is used, and a superior kind of sugar is produced, which is sold for home consumption at three times the price of ordinary sugar. The molasses are also worked up into sugar. These central factories are yet in their infancy in the island, and upon their success or failure will probably depend the fate of sugar cultivation at Puerto Rico. The majority of the planters complain that at present prices sugar is grown and manufactured without any profit, and even at a loss. It is said to be beyond doubt that sugar-making cannot be continued in Puerto Rico upon former principles. On the other hand, while common Muscovado sugars are thus produced at a loss by the ordinary methods of manufacture, crystallised centrifugal sugars are made at the central factory at a total cost, delivered in the market, of 8s. per hundredweight, and that such sugars bring an average nett price of 16s. per hundredweight, thus affording a large balance of profit. Notwithstanding all this, it seems there is an enormous waste, and great annual loss in the Sugar-cane produce. The plant itself is described as being almost in its wild state, little or nothing having been done towards improving its natural condition, in augmenting the saccharine richness of its juice, &c., besides the incredible waste in the process of manufacture. In expressing his own opinion upon the future of the sugar cultivation in Puerto Rico, the British Consul says it will no doubt continue to decline, and that its place will be taken, wherever practicable, by Tobacco, the cultivation of which is steadily increasing and fetching very remunerative prices.

Regarding the Sugar-cane disease, it seems that new varieties of seed cane have been introduced from all parts of the world, and planted with satisfactory results. "It appears thus," we read, "to be an established fact that the remedy for the Sugar-cane disease consists in the introduction of new seed combined with an improved state of cultivation."

Of the Tobacco produce there are considerable quantities both exported and consumed in the island. The plant thrives well, and the quality, especially in the Rio de la Plata district, is very good, but it would appear that as yet the preparation of Tobacco, after the harvest, and the manufacture of cigars is not sufficiently advanced for it to enter into direct competition with Cuban Tobacco, though a great deal of the Tobacco grown for export is shipped to Cuba, to be there made into Havana cigars.

The cultivation of Coffee, which is largely grown in Puerto Rico, is thus described:—"From the time that the young plant springs up of its own accord from the fallen berry under the parent tree, until it ceases to bear fruit some forty or fifty years afterwards, it is an object of the planter's solicitude and attention. When the seed-plants are transplanted into new ground it is under Plantains and larger trees of quick growth,

which have been prepared ready to afford the necessary shade; as the young plant grows the shade is modified or decreased to suit its strength. The first crop is borne three or four years afterwards, and is gathered in three successive months, each berry being picked by hand one by one. After the outer husk is removed in a mill the inner berry, which is divided in two halves, except in the rare case of *caracoles* or shells, where only one berry is found, is laid out on the drying ground from sunrise to sunset; the berries are then put in a mill, which removes the inner husk. Then they are picked and re-picked until they get into the exporter's hands, when they are all picked over one by one again to suit his market. Those intended for the Mediterranean are put into a mill and polished, a little colouring matter being added when necessary. This picking is all done by women in the merchant's store, a given quantity being weighed out to each picker."

### THE TURNER COLLECTION OF ORCHIDS.

ALL those who visited the Manchester great show at Whitsuntide for the past two seasons will have some recollection of the beautiful bank of Orchids exhibited by Mr. Wm. Turner, of Over Hall, Winsford. Before a collection so beautiful and so valuable can be exhibited there must be some others to draw upon left at home, and consequently it may be an interesting matter to a rapidly-growing Orchid-loving constituency to pass under review the Turner collection of Orchids as I found them at home.

I will not take up space by discussing the particular features of the surroundings of Mr. Turner's modern Hall any further than to say that it is situated on somewhat high ground, overlooking the townships of Winsford and Over, and that, with the exception of these townships, as far as the eye can reach, one sees only purely agricultural Cheshire.

With the exception of a somewhat spacious conservatory adjoining the Hall, the houses, erected quite in proximity, are all devoted to Orchids. They are four in number—1, the East India-house; 2, the Dendrobium-house, which does general service in the meantime; 3, the house for cool Orchids; 4, the Cattleya-house. With that number of houses, varying in temperature, in treatment as regards ventilation, moisture, and other matters Orchidical, Mr. Turner finds he can grow (and so can anybody with similar compartments) most of the exotic Orchids that have found their way to this country.

#### THE EAST INDIA HOUSE.

The East India-house is of the usual description, span-roofed, with centre table of stone and side tables of slate, with abundance of piping for keeping the house comfortable in all weather. On the centre table were some very good examples of *Vanda suavis* with sixteen growths, some good *V. tricolor*, and a plant of *V. suavis Pescatorei*, by far the handsomest of the sweet-scented forms, and easily distinguishable out of flower from its vigorous habit. Alongside of these were *Aerides virens* Dayanum, 4 feet high—which, by the way, still stands conspicuous as one of the best of the *Aerides* tribe (I mean in its best form), *Aerides odoratum purpurascens*, *Aerides quinquevulnera*, *Fieldingii*, *maculosum*, *Lobbii*, and the very rare and beautiful narrow-leaved form of *Aerides*, which, notwithstanding its strap-shaped leaves, yields a raceme of great length, and of fine rich colour. Alongside this were one or two well grown plants of *Aerides Schrederi*, still very rare, having only been introduced once; plenty of *Aerides crassifolium*, good as an individual flower. By far the most conspicuous plants, however, in this division, were the *Saccobulbiums*. Nothing could possibly be finer than *S. premorsum* Turneri, which every Orchid enthusiast was enraptured with when in blossom at the Manchester show, and it is going on in full vigour, suspended in a basket from the roof. Nor is *S. guttatum*, *Loddiges' var.*, nor the many forms of *Blaueli*, one whit behind in vigour; indeed, from the grosser growing to such small fellows as *S. curvifolium* and *ampullaceum*, which are now so plentiful, and so very pretty and effective when in flower in October, there are abundant signs of vigour, and promise of plentiful blossom. *Cypripeds* are in rude health, as might be expected, the great leaves of *Parisii* being like the Scotch Leeks of East Lothian, which the grower averred reached from Mother Earth

to his armpits! The pretty white-flowered *navium* does not, seemingly, get along so well. I never saw anything like the batch Mr. Bockett had before he transferred his plants to their present dwelling. They were in hundreds of flowers some half-dozen years ago, and such flowers too! Nor is Mr. Turner, seemingly, satisfying himself with the culture of *Phalenopsis*; there are some good plants of *amabilis* and of *Schilleriana* and *Ludemanniana*, but in bulk they are not so good as his other plants. He may, however, be complimented on the marvellous display he had of Australian *Dendrobes*. At the time of my visit they were quite a charming lot of racemes, and of that colour, too, so rare in Orchids. They were *D. bigibbum*, *Golbicanum*, and *superbiens*—all in flower, and the plants in excellent health, which is the exception. Many evidently have succumbed to cold treatment, plenty would go if allowed to get infested with thrips. Among the three species, or, more correctly speaking, two species (for *Golbicanum* and *superbiens* are only forms of one species, and, in my opinion, ought not to have been separated) give me *bigibbum*. It has form and style to recommend it, although the other two are more deeply coloured, but the wavy segments, without any irregularity about them, destroy their appearance if you compare them with a group of *bigibbum*. Grow that species well, and it is a charming addition to our winter flowering *Dendrobes*—only take a wrinkle from Mr. Turner, and grow it in brisk heat and keep it clear of thrips or spider.

Another plant which struck me, in fine health and in flower, was the difficult-to-grow *Dendrobium Lowii*. It is one of the nigro-hirsute section that has baffled many a good grower, and the flower is so exquisite—so much detail about it as to keep a keen eye resting on it for a while—a good laster to boot, and in colour a match for *Cattleya Dowiana*. It had a pseudo-bulb a yard long, and seemed to be going along all right. A really first-rate thing of modern introduction is *Dendrobium album*, as wax-like in flower as an ivory *Angraecum*, and as sweet in the perfume as a Tea Rose—a good flowering subject as well, and not a bad grower. A far more difficult species alongside of it was *D. Macarthurii*. This seems to be going the way, if not of all the earth, at least of *D. Fytchianum*, and two lovely subjects they are, but we require them to be introduced steadily, like *Epidendrum bicornutum*, or *Cattleya superba*, else they might disappear out of our collections. Here, too, was the rare *Grammatophyllum Ellisii*, with rather handsome glaucous leaves, and not unlike a *Cymbidium* in pseudo-bulb with its prominent sheaths. Another formidable looking fellow, which you have had some correspondence about, is the giant of *Bolbophyllums*—*B. Beccarii*. It is not unlike a stiff-leaved succulent, and might do duty for an umbrella at a pinch—its leaves measuring 16 x 10 inches.

#### THE DENDROBIUM HOUSE.

Passing out of that house the adjoining one is chiefly filled with table plants and Ferns, with *Dendrobiums* resting, such as masses of *Schrederi*, lumps of *Falconeri* in fine condition, a few *Wardianums* and *chrysanthums*, with some very finely grown examples of *Cattleya gigas* without spot or blemish, only refusing to show flower-spines; and some other fine things. In reference to *Dendrobium Wardianum* it might be said that Mr. Turner is particularly careful not to expose it to too much cold, nor to prolong its resting season beyond what is judicious. There seems to be a lot of that favourite *Dendrobe* "going back," which is doubtless partly due to its habit of continuous growth, more like *chrysanthum* in this way than *nobile*. Moreover, it is a *Dendrobe* like *Dalhousianum*, in respect of its great objection to cold and over-much moisture in the height of the growing season. Put that and that together and we have a very palpable reason for non-success in its culture—such is my opinion at all events.

#### THE COOL ORCHID HOUSE.

The house for cool Orchids has been recently put up, and is one of the north-exposure houses not over-heated. It is about 50 feet long, and contains plants in variety in the height of vigour. The plants in this house are not the specimen size of those in the other houses; yet there are some masses of *Odontoglossum Alexandre*, a smaller lot of *O. Pescatorei*, a large and very fine lot of *O. cirrhosum*, which by the way is one of the most generally useful Orchids for families that require a quantity for cut-flower purposes—moreover,

too, in some of the denser paniced sorts there is very much to admire. I do not care much for the long lanky flimsy-substanced sorts, but the species is a welcome addition to our best Odontoglosses—although it will never vie either with the Princess of Wales' nor yet Pescatore's Odontoglosses for anything that is wanted in first-rate family decoration. *O. Hallii* and triumphans, gloriosum, hystrix, and particularly nebulosum, were as good as possible at the size; nor must *O. Cervantesii* and *Rossii* be omitted; in quantity they are most effective and intrinsically beautiful—fine little growing fellows for the gorgeous *Sophranites grandiflora* and *coccinea*, and occupying little space. *Masdevallias*, too, come in for a share of admiration. In colour the best of them are very captivating. Here they are in hundreds—*Harryana* and the best of its varieties, *Veitchiana*, *igneia*, *Lindenii*, which in its best form can scarcely be approached for loveliness of tint, and if they are combined with the grotesque forms of *M. bella*, *Chimera*, *nycterina*, *gongora*, *maculata*, and a troop of others, they form a most interesting section of cool Orchids, and with care they are easily cultivated. For a real paper-white Orchid, *Masdevallia tovarensis* stands alone; there is nothing wax-like about it, as one sees in the white *Lycaste*, the white *Lælia*, the white *Cattleya*, but a sort of paper-like transparency; and it is free, very free, in flowering, only there are two varieties about—a big and a little flowered one; other points being equal, the biggest is the best. This house was well moistened, and if the plants are carefully wintered they will be a fine lot, and give plenteous efflorescence as the season advances.

#### THE CATTLEYA HOUSE.

The Cattleya-house is span-roofed, with high sides to suit specimen plants, a table being on each side of a central path, and contains many very well grown and valuable plants. It is about 70 feet long; and, although chiefly tenanted with *Cattleyas* and *Lælias*, yet evidently proves an agreeable home for many other species. Among the allies might be named a good plant of the pretty *Trichosma suavis*, a plant of *Polystachia*-like growth, emitting a short spike of white and chocolate flowers so marked as to be not unlike a finnet's egg—very sweet. *Cypripedium Stonei* and *caudatum*, two invaluable plants for competing purposes—the first rather difficult to catch—are here in very fine order, the latter with about thirty growths. Another plant one seldom sees in anything like condition was very good—*Dendrobium Jamesianum*. This is the same thing that was first introduced as *moulmeinense*, differing chiefly in the deep orange throat from *infundibulum*. Both these species have fallen victims to too much heat; pity it is, for their flowers are not only superbly beautiful but of great endurance. *Pilumna fragrans* is to be seen here good, but it is scarcely possible to see a bad plant of this easily-grown and free-flowering species, which is quite as fragrant as its name implies. *Cymbidium eburneum* is in quantity and showing plenteous flower-spikes. Among the *Lycastes* the charming white form is here in a good plant, and if prices of this rule as they did in Edinburgh over the *Milor* plant it is a valuable morsel. *Odontoglossum citrosimum* in many plants, and, I understand, in five varieties, is pleasant to look upon, the leaves in most of the plants being without blemish at the extremity—more the exception than the rule, as all growers know, and it is not easily accounted for. *Dendrobiums suavisimum* and *clavatum*, side by side, were particularly noticeable; the one fat and plump, the other lean and spare—both in fine vigour. *Odontoglossum vexillarium* was superbly cultivated, three plants having eight-and-twenty leafy growths: grand these will be if the growths can be conserved to yield of their freeness of blossoming spikes. Scores of *Odontoglossum Roezlii* were growing on shelves close to the glass as free of blemish as it was possible to be—not a thrips mark, all growing luxuriantly; indeed, I never saw such a lot so unexceptionally fine. *Oncidium Weltonii*, with its one or two *aliases*, appeared well among the lot; and so did *Vanda cærulea*, with three fine growths, in fine health, but not in so good variety as I have several times seen. Another very fine subject in good order here is *Oncidium Marshallianum*; this is possibly, when in first-rate variety and in health, the chief of all the yellow-ground *Oncidiums*. Another very distinct *Oncid* that took the eye is *phymatocidium*, so distinct in its leaves, and so very pretty when in flower with its myriads of insect-like blossoms. There were

many plants suspended, but what struck me most was healthy plants of *Barkeria spectabilis* and *elegans*, which usually grow less and less every year.

Among the *Cattleyas* was one grand plant of *aurea* with sixteen pseudobulbs and two growths; undoubtedly, if we look at its condition, one of the best of that species in cultivation. It is of the *Dowiana* type, but as I used to grow it, it appeared to me (and looking at this plant I am justified in the observation) to be of easier cultivation than the species to which it is compared. There were also several plants of *labiata Pescatorei* and *labiata macrophylla*, many of *Mossie*, one of *Wagneri*, many *Triantes* and *Warszewiczii*, and a so-called *Triane alba*, some splendid pieces of *Mendelii*, still one of the best; several *Skinneri* and one *Skinneri alba*, some good *Warneri*, *maxima*, *Dawsoni*, a particularly good piece of *bulbosa*, many *Regnelii*, *Schilleriana*, and *superba*, as well as *marginata* and *marginata Dayana*, *lobata*, *Leopoldii gigas*, most of them in good condition, and many of them in very fine plants, contrasting well with the taller *Lælia purpurata* and *Brysiانا*, the latter a magnificent specimen; also very good plants of *anceps* and some of its giant forms. Among the rarer *Lælias* I noted *gigantica*, a very good form of *elegans*, and several of the latter, including *Turneri*, also *Lælia purpurata Williamsii*, *Wolstenholmei*, *elegans-like* in habit but very distinct in efflorescence, and very scarce; also *Stelzneriana* and *Warneri*, both forms of *elegans* but chancing to bear specific names—very pretty and very rare notwithstanding.

These form the chief of a selected lot of Orchids of all kinds, and Mr. Turner is to be congratulated on being the fortunate possessor of such a fine group. He both knows and prizes his plants as well as any amateur in this country. This is to be expected from the knowledge he gained while the *Pendlebury* collection, famous until it was dispersed, was in existence. He is ably seconded in all matters bearing upon cultural routine by his young and enthusiastic gardener, Mr. Bolt, who seems unwearied in his energies and unflinching in his perseverance to keep all things in proper order. *James Anderson, Meadow Bank.*

#### PALMS OF JUAN FERNANDEZ.

JUAN FERNANDEZ is only 10 miles in length, and 20 square miles in area, and from this elevated point nearly the whole extent of the island could be overlooked; yet this tiny spot of land contains birds, land-shells, trees, and Ferns, which occur nowhere else in the vast expanse of the universe but here or in the neighbouring *Masafuera*. One could almost count the number of trees of the endemic Palm (*Ceroxylon australe*), and estimate the number of pairs of the endemic humming-bird existent at a bird for every bush. Two of the species of land-birds, and all the twenty species of land-shells of the island, are endemic. The temperature at the Monument at 11 A.M. was 65° F. A small bat, possibly disturbed by the sound of the gun, was seen to fly past. The common Sow-thistle (*Sonchus oleraceus*), the ubiquitous weed, has climbed up the pass, and grows by the Monument. The endemic Palm has been almost exterminated, excepting in nearly inaccessible places, as on a rock above the Monument, where a group of the trees can be seen but not reached. The terminal shoot of the Palm, especially when cut just before the tree flowers, is excellent to eat, the developing leaf-mass being quite white, and tasting something like a fresh Filbert. It seems to me more delicate than that of the shoot of the *Coccoloba*. The guide knew where there was a tree remaining in the woods, not far above sea-level, and I went with him to it, hoping to find it in flower. As it was not, I cut it down for eating, for the guide was only waiting to let it develop further before felling it for that purpose himself. A few seedling Palms grew near by; Palms of the same genus occur in the tropical Andes. Most remarkable in appearance amongst the Composite endemic trees are the species of the genus *Dendroseris*, allied to our Chicory. The specimens which I saw in flower were rather large straggling shrubs than trees, but with thick woody stems and branches from 10 feet to 15 feet in height. The leaves are very like those of a *Dandelion* in appearance, and the stem when split open has a curiously jointed pith, which has just the smell of a *Dandelion* root, and would no doubt yield *Chicory*. It pours out, like the *Dandelion* and allied plants, a milky juice when cut. *Notes of a Naturalist on the "Challenger," by H. N. Moseley.*

#### Home Correspondence.

**Horticultural Boilers.**—This subject, like many others that come under discussion, has got away from the real question at issue, which, as first broached by me, was as to the merits of improved saddles as compared with upright tubulars. Taking the matter in its broad sense, it was in reality horizontal *versus* vertical. My objection to the upright or vertical tubular boilers was based on the fact of their being costly in the first instance, costly in the setting, more than all others subject to crack, and above all, on the extravagant consumption of fuel inseparable from the position they stand in relatively to the fire burning within them. And despite what has been advanced by the few who have expressed their approval of them, there has been ample evidence forthcoming to substantiate what I have said in giving preference to the saddle or horizontal form of boiler. How stands the case? These upright tubulars have now had over thirty years' trial, they have been largely used, and the evidence of independent individuals extensively engaged in erecting hot-water apparatus, such as Messrs. Warhurst, Moncur and Mackenzie, Lascelles and Bramham—and whose testimony by the way is in accordance with that of all others similarly engaged, who do not happen to have some favourite of their own—is simply this, that the public by using some or other of the improved saddles, or horizontal form in the proportion of ninety-five per cent., at once give a verdict that is incontrovertible, and sufficient to satisfy those who are unprejudiced. But to enable the saddles or other horizontal boilers to extract the full amount of heat possible from the fuel, it is essential that they should be made much longer, even I would say double that which has hitherto generally been deemed sufficient. Messrs. Weeks say they have rebutted by facts and figures every statement that I have made. They have attempted to explain away what I have adduced, yet the facts remain unshaken, as any disinterested observer can have no difficulty in seeing. But statements have been made in connection with this subject and pass for facts, enough to make any one doubt the evidence of one's senses. Those who have taken the trouble to read this correspondence will have noticed the triumphant reference to Mr. Bull's new establishment, Ashburnham Park (p. 534, vol. xii.), where it is related how three "of the most approved form" of saddle boilers failed, and were replaced by three other saddles of a different kind, which likewise would not answer, and were taken out to make way for two upright tubulars. At p. 769, vol. xii., Messrs. Weeks describe in the most glowing terms how these two last accomplish the work, and invite those interested to go and see them. I availed myself of this invitation on the 13th of the present month, and, like all who visit Mr. Bull's establishment, met with the most courteous attention. I was shown the boilers, and found them standing as described. But were they doing the work alone and unaided? Nothing of the kind. Standing right between them is still one of those big much-maligned saddles; it was going as hard as a clean bright fire could drive it, the water singing in it in the way that only takes place when the fire is pushed, and evidently doing its full share, and this although the wind was quite still, and there was no frost. After what has been said about the heating of this place, standing in front of the three boilers—not two as we have been led to suppose—I was going to say I was amazed, but in reality I have ceased to be surprised at anything connected with this boiler business. *T. Daines.* [This discussion must now be closed. EDS.]

**Brussels Sprouts not Sprouting.**—One of the most provoking and inconvenient features of the past erratic season, is the failure of Brussels Sprouts. Whether this is owing to the excess of rain during the growing season, the low temperature, or absence of sunshine, or any deterioration of the seed arising from a succession of bad seasons, it is difficult to say. The fact that all Brussels Sprouts have not refused to sprout rather favours the latter hypothesis. Singularly enough, too, the imported, which is generally the best variety, is that which has most generally failed this last year. What is known as English or London seed in the trade, has sprouted better than the Imported. This is a very mild way of putting it, for in several cases that have come under my notice the imported Sprouts have failed to sprout at all. This has been the case with my own. These were sown in heat in February, carefully nursed up, and put out strong plants at the end of May—a plan that has usually proved very successful in getting the Sprouts in early in October. This year the plants grew as well, though rather taller than usual, but have simply, taking them as a whole, refused to sprout. Were this an isolated instance it would not perhaps be worthy of notice; but it is not so, and the cause of this failure to sprout may be worthy of investigation. It can hardly be put down

to inferior quality of seed, for the seed is from a firm that has long held the first place for the excellence of its culinary vegetables and the extreme care with which they are selected. I have had Brussels Sprouts from the same firm for a quarter of a century, and never failed before. Can it be that imported seed is more susceptible of injury from a cold and sunless season than English grown? The Sprouts that have failed to sprout have the embryos of Sprouts in plenty on their tall stems; these, however, have simply failed to develop into usefulness. *D. T. Fish.* [Climatal causes would seem to have brought about the arrested development. Eds.]

**Picea lasiocarpa.**—There has always been some confusion about the synonyms of this tree. The late Mr. John Standish, from whom in his nurseries at Ascot I have had many a lesson in the distinctions and habits of coniferous trees, used to be considered a good authority, getting his information as he did from headquarters. I have several fine specimens bought from him ten years ago under the name of *P. Lowiana*, for which he used to give *P. lasiocarpa* and *P. Parsoni* as synonyms. I have also some trees bought from him as *P. grandis*, apparently quite a distinct tree, the foliage of which at first sight is hardly distinguishable from that of the common Yew. He used to say, however, that these two trees were so nearly allied in their cones and other characters that botanists were in doubt whether one was not a variety of the other. At that time certainly, if not now, there was on the grass behind one of the museums at Kew a specimen of Standish's *P. lasiocarpa* labelled *P. grandis*. [Still there.] Mr. Standish's nomenclature, however, agrees with that adopted at Elvaston Castle, where there are very fine specimens of both trees, and with the trees sent out from Elvaston Nurseries by Mr. Barron, and I think it is generally followed in gardens. At Dropmore, however, there is a very fine *P. grandis*, which Mr. Frost always shows as *P. amabilis*; also a *P. amabilis* which he names *P. grandis*. This is evidently a mistake on his part, though I have failed to convince him of it. *C. W. Dox, Grange-over-Sands, Jan. 10.*

**Dean's Early Snowball Cauliflower.**—From what I had heard in praise of this Cauliflower I was induced to give it a trial in 1879, and I must say that it is the most useful variety I have ever grown. My man, who has had charge of the kitchen gardens here for nineteen years, was so pleased with it that he asked my permission to allow him to show it to some local cultivators, who take great pains to grow good Cauliflowers and succeed in doing so, and they pronounced it to be the best and most distinct Cauliflower they had ever seen, being dwarf, very early, firm, and white, and coming into use at a time when there are few Cauliflowers in the garden. It must not be confounded with the Early Dwarf Erfurt, which is of taller growth and longer in turning in fit for table. It is therefore very important to have Dean's Early Snowball Cauliflower quite true. *T. King, Devizes Castle Gardens.*

**Sternbergia lutea.**—Frost and snow appear to have no deterring influence on this Amaryllis, for no sooner has the latter disappeared from off the surface of the earth than the yellow flowers of the *Sternbergia* are seen unfolded amidst the deep green foliage while all else is bare around, except where clumps of Christmas Roses are growing, the two seeming to vie with each other as to which shall peep out of their prison house first. The latter is generally the most successful, and right welcome it is with its large salver-shaped blooms so useful for cutting. Soon we shall see the Aconites pushing through and other harbingers of spring, that do so much to make borders gay and pleasant looking after the long and dreary season we have just passed through. I would just add how much more the effect of all these bulbous plants is heightened if the soil be neatly raked before they get more advanced, as then there is nothing to offend the eye or be out of harmony with Nature's first offerings. *J. S.*

**Sheep Poisoned by Nightshade Berries.**—All owners of sheep who read the brief statement of "J. S." on p. 52 will be anxious to know more particulars of the case. It is likely enough that sheep might be poisoned by eating the berries of the Woody Nightshade (*Solanum Dulcamara*) in large quantities, but has "J. S." sufficient ground for saying that this plant is one from which "farmers often suffer"? "J. S." would confer a benefit on farmers if he would kindly tell us these things. Is it certain that the sheep had been eating the Nightshade berries? Were the appearances before and after death such as to lead those who understood sheep well to the conclusion that they had been poisoned? What are the symptoms in sheep of poisoning by Nightshade berries? I know what they are in boys, and the effect is exceedingly rapid; there is no "pining away." I recollect a boy of twelve at a boarding-school whose life was but just saved by emetics within an hour of eating Nightshade

berries. In the absence of more conclusive evidence than appears in the short account given by "J. S." we must remember that the past season has been remarkable for the mortality among sheep from diseases caused by constant wet, and that if sheep are liable to eat Nightshade berries and to be poisoned by them, both *Solanum Dulcamara* and *Solanum nigrum* are so common, at least in the South of England, in fields into which sheep are turned in autumn, that we should hear oftener than we do of these plants as a source of danger. It does not always follow that plants poisonous to man are poisonous to cattle. For example, the common Hemlock (*Conium maculatum*), the Water Hemlock (*Cicuta virosa*), and the Hemlock Water-drop (*Eranthe crocata*), are amongst the most poisonous of plants to man; but the first is said to be eaten freely by sheep without danger, and the two latter are certainly eaten by cows, and do them no apparent harm. I hope that "J. S." will let us hear more of this interesting case. *C. W. Dox, Grange-over-Sands, Jan. 10.* [We suspect that "Nightshade" berries frequently mean *Belladonna*. The berries of *S. nigrum* have been eaten as Tomatoes with impunity. Eds.]

**A Rose Stock Pruner.**—At the meeting of the committees of the Royal Horticultural Society, on Tuesday last, Messrs. John Laing & Co., of Stanstead Park, exhibited a French invention, called the *Sécateur Eglantier*, to the merits of which, for pruning the roots of Rose stocks, we called attention in our volume for 1872, p. 72, but it still seems to be very little known. From the accompanying illustration (fig. 10) it will be seen that the machine, so far as the knife is concerned, is on the same principle as the

FIG. 10.—ROSE STOCK-PRUNER.

pruning scissors proper, the cutting power being increased by the use of the cogwheels. The operator, as was seen on Tuesday in actual practice, stands with his right side to the implement, his right hand working the lever-like handle and his left manipulating the stocks, which are trimmed, roots and snags, with the greatest ease. The power gained by the use of the cogwheels is immense, considering the size of the knife, roots of 2 and 3 inches in diameter being cleanly cut with ease and rapidity. We should add that Messrs. Laing & Co. are agents for the sale of the implement, which might be made available for other purposes besides that for which it was introduced. Eds.

**Rhododendron jasminiflorum.**—I am glad to see my favourite *Rhododendron* noticed, for without exception it is I think the most refined and useful of all the species, the flowers being of such a pure waxy-white and of a form that renders them particularly adapted for making up in bouquets, they having good long tubes, which makes them very handy for mounting, besides which they are not of that fleeting nature peculiar to most other blooms used for such work, but are stout and lasting, quite equalling in that respect those of the *Stephanotis*, so justly in favour with many. The wonder is that it has not been largely grown for market purposes, seeing that white blossoms are so much in request, and the great ease with which it may be forced and got in early to supply the demand. It is not anything that does to associate with *Lily of the Valley*, *Gardenias*, and *suehlike*, but even they are not disgraced by being seen in close company with this sweet *Rhododendron*. *J. S.*

**Plants Introduced by Mr. Fortune.**—All lovers of beautiful flowers, and every admirer of fine trees and shrubs, can now appreciate the enhanced beauty of our landscapes effected by their judicious introduction; and all such must heartily endorse

the remarks at p. 48, in your issue of January 10, relative to the services rendered to horticultural science by Robert Fortune years ago—so long since that, were it not on account of some of his many valuable introductions bearing his name, that name, to which horticulture owes so much, may be said to be almost ignored. And such may well be the case, for, so far as I know, no public recognition or admitted appreciation of his valuable services has as yet taken place. When, as you say, the grave has closed over his earthly career, the world may then realise and appreciate the service he rendered in his time to the cause of science. But why should the world always wait until this event comes off? Or why should the horticultural world in particular withhold the admission of its gratitude until this sad *dénoûment* is accomplished? To unostentatious and plodding perseverance Mr. Fortune added rare discretion and disregard of personal danger and courage of an order at least equal to that required to carry a redoubt, or to lead a forlorn hope. These qualifications he earnestly devoted to the interest of horticultural science. With at the best an imperfect knowledge of the language, he entered a country at that time but little known to Europeans, but which had nevertheless but recently suffered from an aggressive war on the part of his countrymen, and from the effects of which the inhabitants might still be supposed to be smarting: they were, moreover, known, or at least were supposed to entertain somewhat lax ideas as to the sanctity of human life, more particularly to that of an outside barbarian intruder, as he was doubtless considered. But notwithstanding difficulties and dangers, Mr. Fortune succeeded, by his introductions, in enriching the gardens as well as the landscapes of his own and other European countries, as most of your readers well know. And now, when time has so far allowed those valuable introductions to develop their beauties and to prove their hardiness and adaptability to the climate of most European countries, the same might also be a suitable time to in some way show to the world and prove to Robert Fortune that his services were at last recognised and appreciated. *P. Grieco, Cufford, Jan. 13.*

**Taxus baccata var. fructu-luteo.**—The golden-berried Yew has been the finest of all plants in berry, up to the time of severe frost, in the Cambridge Botanic Garden. The colour of the succulent cup-shaped aril, which gives the title of berry, has been no mere apology for yellow, but of the brightest tint, and beautiful from the translucence of the fleshy substance. Its profusion of fruit has made the tree a most conspicuous object, and the yellow colour seems to be brighter and more attractive than the red of the same species. Attention may be drawn to this handsome but rather uncommon variety, so that planters may obtain trees before the season for planting is over. *L.*

**Poor Soil.**—Can any of your readers suggest the best way of treating a neglected estate, with gardens and grass lands of peaty sandy soil, with subsoil of clay and running sand full of water; also as to the cheapest way of draining, the water in the low beds rising to near the surface, flowing as it does through sand from surrounding higher lands? Will a dose of 100 or so loads of clay per acre tend to make the soil more holding if ploughed in with plenty of manure, and pay for the cost? The natives laugh at the idea! What manure would be most advisable? and, lastly, would Pine trees and roots be better worth burning into charcoal or ashes for manure than selling at about one or two shillings each? *Woking Sands.*

**Fruit Culture: Restriction or Extension?**—In your last issue you inserted a few lines of mine on this subject, wherein I mentioned an instance where the restriction system would be the suitable one to adopt, and where the extension system would be entirely out of place. I should now like to mention a case in which the advantages would be very greatly in favour of the extension system. Suppose a landowner has a tract of land—a deep rich loam of a moderately retentive nature, but not too stiff, cold, or waterlogged—land that does not hold superfluous water, but yet retains sufficient moisture in the subsoil to support trees growing on it through a long drought uninjured—(there are very few large estates in the country on which some such land does not exist); land like this would be half wasted if planted with root-pruned and surface-rooting trees, because the supplies of plant food in the deep and rich subsoil would by such be entirely undrawn upon. In a case of this sort trees on free stocks only should be planted, rank and vigorous growth encouraged, and only sufficient pruning resorted to, to keep the trees well balanced and the branches from getting crowded. Fruit should not be expected for the first few years, indeed such free-bearing sorts as Lord Suffield Apple should have the fruit, which no doubt they would set in quantity, pulled off at once in order that their youthful vigour might be in no way checked, and that

growth of root and branch might be encouraged in every possible way. It would be a great mistake to take crops too soon from trees on the free stock in such soil as this, because as soon as they commence bearing heavily their vigorous growth of root and branch begins to cease. The larger the tree, the more fruit will it be capable of bearing in after years; and the larger the roots, and the greater the portion of ground they occupy, the greater the quantity of sustenance they will be able to supply for the bringing of the crop to perfection. Trees grown on the extension system are not, or should not be immediately remunerative, but to those who can afford to wait, if planted on suitable soil, and occupying a position where other conditions are favourable to success, they will doubtless answer best in the end, and will need comparatively little care or expense after the first outlay of preparing the ground and planting them. About the distance apart to plant Apples, Pears, Plums, and Cherries, on free stocks to be grown on the extension system, no fixed rule can be laid down; much depends on the sort, the soil, and the climate. Some sorts in some soils might be planted as close as 15 feet from tree to tree; other sorts in deep rich soil should have as much as 30 or 40 feet between each. In warmer parts of the country trees will grow to a larger size than in colder and drier parts, therefore climate should also be considered before determining the distance apart to plant the trees. Certain information on these and other points can be obtained from gardeners who have resided a long time in the neighbourhood of a proposed fruit farm, which it is impossible for others to impart. A fruit farm planted with trees in the way I have suggested, does not need to be unproductive before these permanent trees arrive at a profitable stage of growth. At first, as they occupy very little room, one or two trees on dwarfing stocks may be planted between each, and a Gooseberry or Currant bush between each of these again, or the ground may be occupied by Raspberry canes, be cropped with various market-garden or ferra crops, or laid down to grass; and if the trees are protected from them, stock may be turned in. In this case, however, standard trees must be planted, but if stock be not turned in, maiden or two-year trees are to be preferred, as they cost less, and will take to their new positions more readily. Of course great care should be taken not to impoverish the ground in any way by taking crops off without well manuring. No one I think will doubt but that fruit-farming on a large scale, on suitable soils, in suitable localities, systematically carried out, is very profitable. It, however, requires a combination of brains, capital, and energy—a combination which commands the other essentials to success, and makes it certain. *J. E. Evans, Norwich, Jan. 12.*

**Wall Fruit Trees.**—Allow me to add the weight of my testimony to the value of the suggestion contained in last week's Calendar, viz., to give to our wall fruit trees "narrow borders all to themselves." I first saw the suggested system (minus the mulching) in operation on assuming charge of a large garden in North Wales some twelve years ago, and it was continued during the three years of my management. The borders referred to were about 6 feet in width and some 200 yards long, and the trees consisted of Apricots, Cherries, Figs, and Pears, and they were all remarkably fine, healthy trees, always carrying heavy crops of first-class fruit. *Hercfordian.*

## Reports of Societies.

### Royal Horticultural: Jan. 14.

**SCIENTIFIC COMMITTEE.**—Sir Joseph Hooker, K.C.S.I., in the chair.

**Vine Disease.**—Dr. M. C. Cooke alluded to the new disease in the Vine caused by a fungus like that producing the Potato disease, and belonging to the same genus, viz., *Peronospora viticola*. This disease it appears is spreading extensively on the Continent, and has lately been recorded from Italy.

**New Zealand Plants.**—Mr. G. F. Wilson showed a series of beautifully executed coloured drawings by Mr. Nolan, of New Zealand and Australian plants. The fidelity of the representations and the tasteful grouping were much admired.

**Bud Variation in Spruce Fir.**—Dr. Masters showed a fine specimen from Hampshire of a mass of densely crowded, contracted branches on the bough of a Spruce Fir—a formation analogous to the Clanbrassil Fir. It is interesting to see that this singular variety is produced by bud-variation, as also from seed.

**Solanum Dulcamara.**—The Rev. George Henslow showed a specimen of the maritime form of this species from Walmer beach, some of the leaves of which were densely clothed with hair, perhaps in consequence of the puncture of a mite (*Phytoptus*).

**Insects in Pitchers of Sarracenia.**—Mr. Henslow mentioned the fact that the pitchers of these plants became choked with insects, which in their

decay brought about the rotting of the pitcher. The fact of the larva of a dipterous insect (*Sarcophaga sarraceniæ*) making its home in these pitchers, and feeding on the insects therein entrapped, was also commented on.

**Destruction of Insects by Yeast.**—Mr. MacLachlan called attention to a pamphlet of Dr. Hagan's, in which he advocates the use of yeast as an insecticide. The idea was suggested by the fungus which is so fatal to flies in autumn.

**Malformed Root of Ash.**—Mr. Jennings showed some curious outgrowths from the roots of the Ash, which were referred to Dr. Masters to be examined and reported on.

**Cocoons from West Africa.**—Mr. Jennings showed a curious pear-shaped felted case, which, when slit open, was found to contain a colony of hundreds of cocoons of a lepidopterous insect (*Anaphe*).

**Japanese Objects.**—Mr. Maries showed a large and varied collection of objects of natural history—birds, reptiles, insects, works of art, antiquities, prehistoric weapons, musical instruments, and other curiosities from Japan. A special vote of thanks was unanimously awarded for the collection.

**FLORAL COMMITTEE.**—Dr. Denny in the chair. Messrs. James Veitch & Sons were the largest contributors to the success of this, the opening meeting of the year, their contributions including capital groups of Cyclamens, white and purple Chinese Primroses of excellent quality, an admirable group of Lily of the Valley, and a most attractive collection of Orchids in flower, consisting, amongst others, of the sweet little *Dendrobium endocharis* ×, *Colax jugosus*, *Oncidium cheiroporum*, the new and scarce *Cypripedium Haynaldianum*, *Chysis Chelsoni* ×, a fine specimen of *Saccolabium giganteum*, and a number of others, the names of which are mentioned in another column. The same firm also showed some forced plants of *Staphylea colehica*, a most useful, free, white-flowering shrub, which cannot be too strongly recommended for this work. The committee accorded a vote of thanks, and recommended the display for the award of a Silver Medal. Mr. Cannell again sent a rich collection of cut blooms of Zonal Pelargoniums, clear and lustrous in colour, and, if anything, larger than ever. Many of the varieties shown have already been commented upon, but two amongst them claim a passing word. These are Mrs. Moore, a large white flower, with a distinct ring of red round the eye—a very distinct flower that will be much appreciated when known; the second one is Joyful, a vivid scarlet, suffused with purple—a remarkably bright flower when seen in a good light. Mr. Cannell also brought up a handful of flowers of the *Marguerite Chrysanthemum frute-cens*, a most useful and pleasing plant at all seasons; also flowers of *Fuchsia thymifolia*, *F. microphylla*, and *F. splendens*. The committee also recommended Mr. Cannell's exhibits for the award of a Silver Medal. From Messrs. Osborn & Sons, Fulham, came some nice cut blooms of Mr. Gilbert's new double Primulas; and Messrs. Sutton & Sons, of Reading, showed a fern-leaved Chinese Primrose, named *Rosy Morn*, rosy-pink in colour; and a semi-double flowered form of the same variety; also a few Cyclamens. Under the name of *Azalea purpurea nana*, came from J. H. Mangles, Esq., Hazlemere, a semi-double, rose-pink flowered, hardy Azalea, which was believed to be the same or but slightly different from the very old *Azalea ledifolia*. Samples of a shallow pan which has been highly recommended for use in the cultivation of Orchids were shown by their maker, Mr. John Matthews, of Weston-super-Mare.

### PLANTS CERTIFICATED.

Only two First-class Certificates were awarded at this meeting, one of which went to Messrs. James Veitch & Sons for *Masdevallia tovarensis*, a plant that has been in cultivation about fifteen years, but which, until now, has not been honoured with any award. The specimen showed to-day was a fine one, with over seventy of its pure white flowers, in many instances produced three on a scape, and might have appropriately received a Cultural Commendation. The other certificate was taken by Mr. Bull for the pretty new *Barkeria cyclotella*, which is figured and described in another column.

**FRUIT COMMITTEE.**—H. Webb, Esq., in the chair. By far the most interesting of the few subjects which came under the notice of this committee was a number of pans of admirably grown Water Cresses, exhibited by Mr. Shirley Hibberd, of Stoke Newington. The varieties shown were the Erfurt Sweet Cress, and the Stoke Newington Purple Cress, a local variety, which Mr. Hibberd stated was exhibited for the purpose of showing that the distinctive characteristics of varieties of Water Cresses are the result solely of local circumstances. A large collection of varieties, obtained from different parts of the country, have been planted in the same brook at Stoke Newington, and all have quickly lost their original peculiarities, and have acquired the deep green leaf and purple-tinted stem of the kind here presented.

A vote of thanks was accorded to the exhibitor. A similar vote was also passed to Mr. G. Goldsmith, gr. to P. C. Hardwick, Esq., Hollenden, Tonbridge, for specimens of a dozen varieties of Pears, of which the best were General Todleben, Beurre Superfin, Louise Bonne of Jersey, and Doyenné Boussoch. From Messrs. Barr & Sugden came an attractive basketful of finely crested and brightly coloured Kales, which also met with a like reward.

**Manchester Botanical and Horticultural: Jan. 7.**—A meeting of this Society was held on the above date at the Old Town Hall, Mr. Bruce Findlay presiding. The principal business of the evening was the reading of a paper by Mr. Robert Tait (of the firm of Dickson, Brown & Tait) on the Hyacinth—its history, propagation, and culture. There was a good attendance.

Mr. Tait having traced the history of the Hyacinth from the earliest period, said there were three ways of propagating it. The first was from the seeds, but by this means one could not depend upon getting the same colours, the produce from the red, white, or blue being of all shades. Therefore this system had been abandoned except for raising new varieties. When the seeds were ripe they were sown in beds, or frequently in boxes, coming up the following spring similar to young Onions. In three or four years they were planted in the beds and remained there two or three years longer until they showed their flowers. It was generally eight or nine years before the grower could fairly judge of the merit of his pet seedlings. Even if he found at the end of this time a variety worthy of cultivation he had only a solitary bulb to start with. Another ten years must elapse before he could have a sufficient quantity to offer for sale, and then at an extravagant price. The ordinary mode of propagation was by cutting the base of the bulb with three or four deep cuts across it reaching the centre. The bulbs for the purpose were selected at the time of taking up in June. The third process was somewhat different, although the end attained was similar. The base of the bulb was cut away and hollowed out. The culture of the Hyacinth was principally confined to the immediate vicinity of Haarlem and Overveen in Holland. At a conference of the principal growers held last year it was computed that the total exportations annually amounted to the sum of 2,500,000 guilders, or, in English money, £208,333. The principal countries to which bulbous roots are exported are in the North of Europe, of which Great Britain takes about one-half. America also receives a fair proportion, but not so many of late years, owing to the high tariff upon them. Germany, France, Italy, and Spain, each take a fair share. A vote of thanks was unanimously accorded to Mr. Tait for his paper.

The following is the report of the Council to the fifty-second annual meeting of proprietors, to be held in the Mayor's Parlour, Town Hall, Manchester, on Monday next, at 12 o'clock at noon:—

The Council, in presenting their annual report, regret to have to state that the unprecedentedly wet and unfavourable season, and the long-continued commercial depression, have had a prejudicial effect upon the finances of the Society.

The income from subscriptions and life compositions is about £150 less than in the year immediately preceding.

Considerable expenditure has been necessary during the past year upon the exhibition-house, the north side of which had passed into a condition which can only be described as ruinous. The rafters were found to be extensively decayed, and the repainting and renewal of this house cost nearly £300.

The number of visitors to the National Horticultural Exhibition, held last Whitsuntide, exhibits a considerable increase over any previously reported. It is nearly 14,000 in excess of the attendance in 1878, and 5000 in excess of the attendance in 1868, the highest number previously recorded. For this satisfactory result the Council believe that they are, to a very large extent, indebted to the President of the Society (the Right Hon. the Earl of Derby), who kindly responded to the invitation of the Council to attend and open the exhibition.

The National Rose Society held their annual exhibition in the gardens, in July, but, owing to a very wet day, the receipts were nearly £240 less than in the previous year.

The annual exhibition of cottage garden produce and window plants was held in August, when more than seventy exhibitors competed for the prizes offered; and the Council believe that this show is the means of stimulating the energies of a large number of owners of small plots of land.

Three exhibitions were held in the Town Hall, two in the spring and one in the autumn, all of which gave manifest pleasure to a large number of visitors. The Council have made arrangements for a series of meetings of amateur and professional gardeners during the winter months, for the reading and discussion of papers on botany and horticulture, and they invite all who are interested in the promotion of these subjects to communicate such new methods of cultivation as their experience may have suggested, and to transmit such superior specimens of produce as their art may have supplied. In no way can the objects of the Society be more efficiently accomplished than by becoming, as it were,

a centre towards which all the practical improvements made in its vicinity shall tend, and from which they may be again disseminated to fructify in a wider circle. The main range of glasshouses has been erected upwards of fifty years, and is quite unfit, on account of age and structural defects, for the present purposes of the Society. Plans and estimates have been obtained for the erection of a new range, which would facilitate the growth and exhibition of the plants, and add very much to the attractions of the gardens. The funds, however, will not suffice for carrying out this project at present, and without additional pecuniary aid many other important objects which the Council anxiously contemplate cannot be accomplished. They venture, therefore, to recommend the Society to the enlightened liberality of the residents of Manchester and the surrounding districts, as highly deserving encouragement and support. The Council desire to record their grateful acknowledgments for presents of plants and seeds received during the year, from Mr. Selwood, Eaton Hall; Mr. T. H. Jenkins, Higher Broughton; Sir Joseph Hooker, of Kew; and Mr. B. S. Williams, of Holloway, London.

**Edinburgh Botanical:** *Jan. 8.*—The Society met in 5, St. Andrew Square—the President, Mr. William Gorrie, of Rait Lodge, in the chair. It was intimated that two diseased fish had been received from Mr. George Muirhead, Paxton, Berwick-on-Tweed, who in a letter to Mr. Sadler, Curator of the Royal Botanic Garden, stated that on the previous Monday he accompanied Sir Thomas Buchan Hepburn and Captain Milne-Home, in a walk to the side of the Tweed in the policy at Paxton, where a burn runs into the river, and to the Whiteadder at Whiteadder Bridge, for the purpose of seeing the great number of diseased fish which the water-bailiff reported to be in those waters. They went first to the burn, which runs into the Tweed at the east side of the policy, and saw in it, close to the mouth of the burn, where the water stands in a long pool, about half-a-dozen fish covered over with white fungus. They seemed to be in a dying state, and lay quite still when the visitors approached close to the place where they were. They also found one or two dead fish. The fish they saw in the burn and the dead ones were bull trout. They then went to the Whiteadder, just above Whiteadder Bridge, which is about half-a-mile from the mouth of the river, and found the whole water filled with diseased fish. All that they saw, with two exceptions, were affected with fungus, appearing to be spotted with white in the water. They were all bull trout. The diseased fish were mostly lying in the still water at the side, with their heads under the bank or behind stones. The specimens sent had been secured by the bailiff, at Mr. Muirhead's request, for examination by this Society. Sir Robert Christison suggested that he should take the fish to Mr. Stirling, curator of the Anatomical Museum, for examination, and this was agreed to.

A communication was read by Sir Robert Christison "On the Correct Measurement of Trees," in which some interesting comparisons were made between the growth of trees in 1878 and 1879, with the object of showing the effect of light and heat on the growth of wood. Statistics obtained from Mr. Buchan, Secretary to the Scottish Meteorological Society, showed that the mean of maximum temperatures in Edinburgh, for the five months from May to September, inclusive, in 1878, was 64°.7; while for the corresponding period of last year it only reached 59°—the mean temperature for the same five months of 1878 being 56°.8, and for those of 1879 52°.3. Figures were also quoted showing the small proportion of sunshine experienced last year. Bringing these statistics to bear on the measurements of trees which he had taken, Sir Robert gave interesting examples of the extent to which the growth of wood had been retarded by such unpropitious climatic influences.

Mr. Gorrie read a continuation of the paper entitled "Notes on New Zealand Plants Cultivated at Rait Lodge, near Trinity, which Withstood the Severe Winter of 1878-9," of which the first part is published in our present number, p. 75.

Mr. Sadler read a report "On Temperature Registered at the Royal Botanic Gardens from December 1 to January 8." (See p. 83.)

A fine old volume, of large size, entitled *Pomona, or the Fruit Garden*, by Batti Langley, Twickenham, and dated 1729, was shown by Dr. Paterson, Bridge of Allan. It was copiously illustrated, and contained an account of the cider fruits of Devonshire, by the Hon. Hugh Stafford, of Pynes, near Exeter, an ancestor of the present Chancellor of the Exchequer.

**Epping Forest and County of Essex Naturalists' Field Club:** *Jan. 10.*—A meeting for the foundation of this Association was held on the above date at Buckhurst Hill. Mr. R. Meldola, F.R.A.S., F.C.S. (Secretary to the Entomological Society of London), in the chair. Mr. N. F. Roberts, F.G.S., proposed the foundation of the Club, and the resolution being seconded by Mr. W. C. Barnes, it was carried unanimously. The rules (which have been carefully drawn up by Mr. C. Browne, M.A., Barrister-at-law, to meet the objects kept in view by the promoters) were then read and discussed *seriatim*. The principal points, omitting details, are as follows:—The Club is established for the study and investigation of the natural history, geology, and archæology of the county of Essex (special attention being given to the fauna, flora, geology, and antiquities of Epping Forest); the publication of the results of such investigations, the formation of a library of works of local interest and other publications; the formation of a museum; and the diffusion of information on natural science and

antiquities. Members' subscription (both for ladies and gentlemen) was fixed, after considerable discussion, at 10s. 6d. per annum; members living beyond a radius of 15 miles from the headquarters to pay only 7s. 6d. per annum. Persons joining the Club within two calendar months from its formation to be considered original members. In addition to the ordinary meetings of the Club, field meetings will be held in different parts of the county as the Council may think fit; the same being under the entire control of the Council, who may appoint lecturers, and make such arrangements as they may deem best for the comfort of the members and their friends. One very important rule, which met with much approval, and which should recommend the Club to the support of all lovers of Nature, runs as follows:—"The Club shall strongly discourage the practice of removing rare plants from the localities where they are to be found or of which they are characteristic, and of risking the extermination of birds, and other animals by wanton persecution; and shall use its influence with landowners and others for the protection of the same, and to dispel the prejudices which are leading to their destruction. The rarer botanical specimens collected at the field meetings shall be such as can be gathered without disturbing the roots of the plants, and notes of the habits of birds shall be recorded instead of collecting specimens either of the birds or of their eggs." To guard against misapprehension it is stated that the rule is not intended to restrict the judicious collecting of specimens by individual members necessary for their studies.

The rules having been passed and ordered to be printed, the meeting elected a Council of twenty-five members; and as President, Raphael Meldola, F.R.A.S., F.C.S., &c.; Treasurer, H. J. Barnes, F.C.S. (Berlin); Secretary, William Cole, M.E.S.; Librarian, W. J. Argent.

### BANKS OF GLOXINIAS.

HOWEVER important a part the choicer kinds of Palms and other ornamental foliaged stove and greenhouse plants may play in the embellishment of our garden structures, there is little doubt that an equally good and attractive display may be produced in various other ways, which will meet with the approbation of the general mass of cultivators, and which will cost but a trifle for the first outlay compared with the expense of even forming the nucleus of a collection of what may be termed the fashionable plants of the day. It is not my purpose here to draw invidious comparisons between certain genera of plants, believing, as I do, that there is room for all, if not in the same garden, at least in the gardens of Great Britain, but to endeavour to show the possibility of enjoying the rare privilege of possessing at a minimum expense, a group of flowering plants of great merit, equally, if not more effective while they last, than many other subjects upon which more care and skill are required in cultivating.

The cost of two or three good packets of Gloxinia seed, is not a heavy investment for any one to make who has the taste or the inclination for cultivating plants, which are so modest in their requirements, that any one possessing a couple of hot frames or pits may grow them to the greatest perfection.

It is necessary to qualify the details of cultivation with this advice: that unless good seeds of a superior strain are procured from a trustworthy source, much annoyance and disappointment may be occasioned, which, unhappily, is too often ascribed to anything but the right cause.

The seeds may be sown almost any time during the spring months, but in order to have an early display, sowing should not be deferred later than the first week in March, and if arrangements can be made to sow early in February so much the better for the chances of success; moreover the bulbs have a better chance of ripening in the autumn when the plants are pushed forward early in the season.

The first and most important step to take, is to see that the necessary bottom-heat of from 75° to 80° is available in which to plunge the pots or pans when the seeds are sown. In sowing it is advised that the work be performed methodically by having the requisite number of shallow pots or seed-pans washed and drained, placing a layer of sphagnum moss over the crocks, and then following with the roughest part of the compost so that perfect drainage will be a certainty. The soil in which the seeds are to be sown may consist of any open rich mould, with a dash of sand to render it porous. It should be pressed down rather firmly, leaving a smooth surface upon which to sow the seeds, then cover them slightly with a portion of the same compost run through a fine sieve, and cover with a few squares of glass with a thin covering of damp moss laid over them to prevent the moisture escaping from the soil by means of evaporation, while the process of germination is

going on, which is generally accomplished in a month from the time of sowing. When the seedlings are fit to be handled they should be pricked off into shallow pans in a compost of leaf-mould, peat broken into small pieces, wood ashes, and a fair proportion of sand according as it is present or otherwise in the soil used. An inch or so of fine mould should again be laid over the rougher portion of the compost, in order that the young plants may root freely into it, and then ramify the soil downwards, taking hold of the rougher pieces of the compost to which they will adhere, when they are large enough to give them their first pot; then return the plants to a brisk bottom-heat near to the glass, and keep up a growing temperature corresponding with the bottom-heat. Kept in a genial growing atmosphere the young plants are soon ready for potting off.

It is a mistake to give too large a shift at once, better let the first potting be into pots say 3 inches in diameter, and the next into 6-inch pots—a size in which the plants may be flowered the first year.

Gloxinias it may be observed are not deep-rooting subjects, and the practical lesson to be inferred therefrom is that shallow pots well drained are the most suitable in which to pot them for their final shift. They delight in an open generous compost in all stages, which should be made rougher as the plants increase in size, of the materials already mentioned, to which may be added for the last potting a small proportion of cow-dung, which has been mellowed by laying up, and which will crumble to pieces when rubbed between the hands, also chopped sphagnum, charcoal pounded small, with enough sand to make the whole sharp to the feel. Where sufficient space can be spared to keep the plants by themselves, where they can be treated according to their own particular requirements, it will be found a great advantage.

The plants, although requiring abundance of moisture at the root in the growing season, should never be syringed overhead after they are transferred from the seed-pan. Of course there are cases where plants have to be shifted about a good deal, and often with fair success, but it is safer in dealing with seedlings that are expected to bloom the same year, to keep them in a steady equable temperature both of top and bottom-heat throughout the whole period of growth.

They will flower in August and September, and will require to be raised out of the plunging material some time before they are taken into the plant stove, or other show-house, with a view of avoiding a check to the development of the flowers by reducing the temperature too suddenly. The best effect is obtained when the plants are arranged "in banks" with the different shades and colours tastefully blended in arrangement.

The idea may be carried out either by having a stage fixed in three tiers, or a less expensive mode would be to raise three rows of shelving upon inverted pots of different sizes which, would answer the same purpose.

A group of such plants with fine healthy foliage and flowers vieing with each other in surpassing beauty—a combination as it were of all colours blended into one harmonious whole—is a sight well calculated to inspire a feeling of admiration in the breast of every lover of flowers.

The flowers come finest in the second year, provided the bulbs are thoroughly ripened off in a temperature of about 55°, and have from three to four months' rest. The bulbs as they increase in age and size will yield a greater profusion of flowers, but the quality is seldom surpassed, if equalled, after the second year. *W. Hinds.*

### Apiary.

**BRITISH BEE-KEEPERS' ASSOCIATION.**—At the quarterly *conversazione* of this Association, held on Wednesday evening at the Board-room of the National Chamber of Trade, 446, Strand, Captain Campbell in the chair, a paper, entitled "The Ligurian Queen Bee—her introduction to alien stocks, and the best means of pure propagation," was read by the Rev. George Raynor, of Hazleleigh Rectory, Maldon. Mr. Raynor said that it appeared to be the general opinion of those who had given the Ligurian bee a fair trial that it much excelled the common black or German bee in the hardness of its nature, in its greater activity, its honey-gathering qualities, the gentleness of its dispo-

sition, and especially in its extreme fertility. It was now twenty years since Mr. Neighbour first introduced the Ligurian bee into England, a length of time amply sufficient to prove its superiority to other varieties. In referring to the origin of the bee, Mr. Raynor said that various experiments made by German apiarians and others had gone far to prove that the present race of Ligurians sprang from a cross between the Egyptian bee (Apis fasciata) and the common German bee.

Herr Kohler, a noted German apiarian, had succeeded in raising pure Ligurians from crossing after twenty generations. He took occasion to remark that the Association was pursuing the right course in introducing specimens of the different varieties of the Apis mellifica to their members for experiments in crossing various races. As to the best means of introducing alien queens, Mr. Raynor considered that the best way was to intimidate the bees, by using a cage in which there were a few simple constructions for the purpose. He was also of opinion that the best way of propagating a pure race was by the present Kohler process. The paper was discussed with much interest by the members of the Association present. A vote of thanks to the writer was passed at the close of the proceedings.

### The Weather.

STATE OF THE WEATHER AT BLACKHEATH, LONDON, FOR THE WEEK ENDING WEDNESDAY, JANUARY 14, 1880.

Table with columns: MONTH AND DAY, BAROMETER, TEMPERATURE OF THE AIR, Hygrometrical Deductions from Glaisher's Tables, WIND, RAINFALL. Rows for Jan 8-14 and a Mean row.

Jan. 8.—Overcast, dull and cold throughout. Thin drizzling rain fell. 9.—A miserable day. Raw cold, Drizzling rain fell. 10.—A very dull day. Drizzling rain fell. Cold. 11.—A dull, cloudy day. Very cold. Windy. The minimum temperature, viz., 30°, occurred at midnight. 12.—A fine bright day. Raw cold. Slight hoar frost in morning. 13.—A dull morning. Little snow fell at about 1 P.M.; fine till evening, then overcast. 14.—A dull, cold day. Overcast throughout. The maximum temperature, viz., 35°, occurred at midnight.

LONDON: Barometer.—During the week ending Saturday, January 10, in the vicinity of London the reading of the barometer at the level of the sea decreased from 30.50 inches at the beginning of the week to 30.45 inches by the evening of the 4th; increased to 30.68 inches by noon of the 7th, decreased to 30.54 inches by the evening of the 9th, and was 30.56 inches at the end of the week. The mean reading for the week at sea level was 30.56 inches, being 0.54 inch above that of the preceding week, and 0.64 inch above the average. The mean daily readings were considerably above their averages on every day, the greatest departure in excess being 0.74 inch on the 7th.

Temperature.—The highest temperatures of the air observed by day varied from 43° on the 4th to 32° on the 9th; the mean value for the week was 37°. The lowest temperatures of the air observed by night varied from 28° on the 9th to 33° on the 4th; the mean value for the week was 30°. The mean daily range of temperature in the week was 7°; the greatest range in the day being 10°, on the 4th, and the least 3°, on the 8th.

The mean daily temperatures of the air and the departures from their respective averages were as follows:—Jan. 4, 38°.6, +1°.9; 5th, 36°.8, +0°.3; 6th, 33°.9, -2°.5; 7th, 34°.8, -1°.5; 8th,

31°.5, -4°.7; 9th, 30°.6, -5°.6; 10th, 35°, -1°.3. The mean temperature of the air for the week was 34°.5, being 1°.9 below the average of sixty years' observations.

The highest readings of a thermometer with blackened bulb in vacuo, placed in the sun's rays, were 66° on the 4th, 49° on the 5th, and 47° on the 7th; on the 9th the reading did not rise above 35°. The lowest readings of a thermometer on grass, with its bulb exposed to the sky, were 28° on the 5th, 26° on the 9th, and about 29° on the 8th and 10th. The mean of the seven lowest readings was 28°.

Wind.—The direction of the wind was variable, and its strength almost calm. The weather during the week was very dull and cold, except on the 4th and 5th, on which days the weather was fine and somewhat mild. Slight mizzling rain fell on the 8th, 9th, and 10th; the amount measured was only 0.04 inch.

ENGLAND: Temperature.—During the week ending Saturday, January 10, the highest temperatures of the air observed by day were above 49° at Truro, Plymouth, Liverpool, Bradford, and Sunderland, and below 44° at Brighton, Blackheath, Cambridge, and Norwich; the mean value from all stations was 46°. The lowest temperatures of the air observed by night were below 30° at Blackheath (London), Bristol, Cambridge, Hull, Wolverhampton, and Nottingham; and above 32° at Truro and Plymouth. The mean from all places was 30°. The extreme range of temperature in the week was above 18° at both Liverpool and Sunderland, and below 10° at Norwich; the mean range of temperature in the week from all stations was 16°.

The mean of the seven high day temperatures was above 45° at Truro, Plymouth, Leeds, and Sunderland, and below 38° at Blackheath (London), Brighton and Cambridge; the mean value from all places was 42°. The mean of the seven low night temperatures was below 34° at Brighton, Bristol, Blackheath, Cambridge, and Wolverhampton, and above 38° at Truro, Bradford, Leeds, and Sunderland; the mean from all stations was 35°. The mean daily range of temperature in the week was above 8° at Plymouth, and below 6° at Brighton, Norwich, Nottingham, and Bradford; the mean daily range of temperature in the week from all places was 6°.

The mean temperature of the air for the week from all stations was 38°, being 9° higher than the value for the corresponding week in 1879. The mean temperature was above 41° at Truro, Plymouth, Bradford, Leeds, and Sunderland, and below 35° at both Blackheath (London) and Cambridge.

Rain.—The amounts of rain measured were small everywhere. At Truro the fall was 0.13 inch, and at Plymouth, 0.12 inch, whilst at Liverpool only 0.01 inch fell; at Brighton, Norwich, Wolverhampton, and Sunderland no rain fell; the average fall over the country was 0.04 inch.

The weather during the week was generally dull and cold, and the sky cloudy. Fog prevailed at some places.]

SCOTLAND: Temperature.—During the week ending Saturday, January 10, the highest temperatures of the air observed by day varied from 51° at Leith, to 49° at both Dundee and Paisley; the mean from all stations was 49°. The lowest temperatures of the air observed by night varied from 26° at Aberdeen to 37° at Paisley; the mean value from all places was 32°. The mean range of temperature in the week from all places was 17°.

The mean temperature of the air for the week from all stations was 42°, being 11° higher than the value for the corresponding week in 1879, and 4° higher than that of England. The mean temperature was 44° at Paisley, and but 40° at Aberdeen.

Rain.—At Paisley the amount of rain measured was 0.30 inch, and at both Greenock and Perth it was 0.20 inch; at Edinburgh the fall was but 0.01 inch, and at Dundee and Leith no rain fell; the average fall over the country was 0.11 inch.

DUBLIN.—The highest temperature of the air was 57°, the lowest 28°, the extreme range 29°, the mean 41°; no rain fell.

JAMES GLAISHER, F.R.S.

### Variorum.

THE WHEAT HARVEST OF 1879.—A full estimate has just been published in the Bulletin des Hautes et Marchés of the Wheat yield of all the world, as compared with the average yield. The average production for the whole of Europe is 962,866,150 bushels, while that of 1879 is only 763,987,500 bushels, being a falling off of 198,878,650 bushels. The average yield for other parts of the world is 1,367,887,500 bushels, and for the past year 1,189,487,500, showing a decrease of 178,400,000. The deficiency of the crop for the whole world is

377,279,150 bushels. The following table is interesting as showing the yield for each country:—

Table with columns: Country, Average Yield, Yield for 1879. Lists countries like United States, France, Russia, Germany, Spain, Italy, etc.

### Enquiries.

He that questioneth much shall learn much.—BACON.

AMERICAN ARBOR-VITÆ.—Can any of your readers say if the common American Arbor-vitæ is injurious to cattle or horses when eaten? I have been planting a hedge of these trees bordering a meadow, and to satisfy the farmer shall be obliged for any information. W. H.

BEE FLOWERS.—What are the best annuals to sow for bees? H., Great Bookham.

MAGNUM BONUM POTATO.—Will some of your correspondents who have grown the above oblige by giving their opinion as to its eating quality? One conspicuous dealer says "the flesh is firm, and of exceedingly fine flavour; very white and mealy." I must say it has not proved so with me during my two years' trial, but probably our northern climate is at fault. At the same time I have not forgotten the Red-skinned Flourball, about which more could not have been said in favour of any Potato. Where is it now? A. B.

ORCHARD-HOUSES.—Will one or more of your correspondents kindly give their opinion upon the best form of construction for an orchard-house—1, the best position; 2, best shape and size; 3, best internal arrangements? A. D. M.

### Answers to Correspondents.

CHISWICK: Thos. Fletcher. 1, Yes; we do not think that any young man could do better than spend a year or two at Chiswick. 2, We cannot say exactly, but very extensive as regards the glass.

CUCUMBERS AND STRAWBERRIES: Inquirer. 1, If you can get Rollison's Telegraph (true), you cannot do better than grow that for summer fruiting; and Syon House or Masters' Prolific for winter. 2, Elton; see p. 84.

GARDEN ARCHITECTS: A Constant Reader. Consult the list in the Horticultural Directory. We cannot undertake to answer such an invidious question.

INSECTS: W. L. The minute black shining insects in the crevices of the bark of your Apple and Pear trees are the common bark mite, Acarus geniculatus. (See Gardeners' Chronicle, 1843, p. 356). Scraping off and burning the loose bark, and then washing the stem and branches with lime and gas-tar water and soft-soap will be found useful in destroying these insects. I. O. W.

LAYERING LIMES: Douglas Wilson. It is not necessary or usual to "tongue" the layers; the method most usually adopted being to give them a twist at the point pegged down.

MUSHROOMS: J. K. H. Wallingford. The fungi you send are no doubt Mushrooms (Agaricus campestris), but the gills are white, as in the closely allied species, A. cretaceus. Your plants also agree well with the variety A. vaporarius, except that your specimens do not change to red when broken or bruised. There can be no doubt that several species and varieties, close to the true Mushroom, are all one and the same plant with a tendency to vary first in one direction then in another. Your plant has points in common with two or three forms or species, and agrees wholly with none. It is probably edible, but it is not the form of A. campestris commonly placed on the table. W. G. S.

NAMES OF PLANTS: Douglas Wilson. We cannot spare the time to identify such scraps. Conifers are difficult enough when the materials are good.—Pal. If your plant bears a yellow flower it is Santolina incana.—T. Anderson. Adhatoda cydoniaefolia.—C. C. 1, Rhopala macrophylla; 2, Asparagus æthiopicus ternifolius; 3, Litobrochia aurita; 4, Pteris cretica albo-lineata.—A Reader. Lastrea æmula.—G. H. R. 1, Echium fastuosum; 2, Goldfussia isophylla; 3, not sent; 4, Dracæna reginae; 5, Yucca aloifolia variegata; 6, Aspidistra lurida variegata.

RAILWAY CHARGES: J. Steele. We do not know of any rule of law affecting the point in dispute; but looking at the question from a purely business point of

view, we decidedly think that your customer was not justified in deducting the 6s. from the account.

SEEDLING GRAPE: *F. Lee*. The sample was smashed when received? Could you not send another earlier in the season?

TROPICAL FRUITS: *C. Wissenbach*. Orange: Citrus Aurantium. Lemon: Citrus Limonum. Pomegranates: small fruiting varieties of Citrus decumana. Shad docks: Citrus decumana. Mandarines and Tangerines; varieties of Citrus Aurantium. Brazil nuts: the seeds of Bertholletia excelsa. Lychees, or Litchis: the fruit of Nephelium Litchi. The Hickory nuts sold in Covent Garden are those of Carya alba.

## SEEDS.

LONDON: Jan. 14.—The market to-day was thinly attended, and no feature of special interest or importance presented itself. For choicest samples of yearling English red Clover there has been a fair inquiry, and long prices have been realised. With regard to French red, present importing prices are above values current here for spot seed. The weather in Canada having lately been very favourable for threshing purposes, some fair arrivals may shortly be expected from that quarter. Last year the total grass seed receipts in Chicago amounted to 43,994,692 lb., for 1878 to 47,995,234 lb. Alsike and white meet with increasing attention. In Trefoil some business has been doing on fully late terms. The upward movement in the value of Italian Rye-grass continues unchecked: of good seed the available supply is exceedingly scanty, whilst the consumption this spring must without doubt be very large. For Tares there is a brisk sale, and the tendency of quotations is adverse to the buyer. Canary and Hemp seed move off slowly at last week's currencies. Trade for Haricots, Lentils, and Peas is slow. For French Millet, 1s. per quarter more money is asked. Linseed is unchanged. *John Shaw & Sons, Seed Merchants, 37, Mark Lane, London, E.C.*

## CORN.

Trade was dull at Mark Lane on Monday. No change was reported in the value of Wheat, either English or foreign, but where sales were pressed low rates were submitted to. Barley, especially feeding sorts, was slow of sale. Malt was without alteration. Oats were very steady, rates showing no change on the week; Maize, however, was dull, and quite 1s. per quarter cheaper than on the previous Monday. Beans and Peas found few buyers, and went off on rather easier terms. Flour was quiet, and quotations had a downward tendency.—No feature of importance presented itself on Wednesday. As regards Wheat, holders were not over firm, and some small transactions took place at rather easier rates. Fine malting barley maintained its price, but the tone was weak for all feeding stuffs. Malt was quiet and without change. Oats were steady in value. Maize was dull at the late reduction; Beans and Peas moved off slowly at about late rates. Flour was difficult to move, and quotations favoured buyers to some extent.—Average prices of corn for the week ending Jan. 10:—Wheat, 46s. 2d.; Barley, 36s. 8d.; Oats, 20s. 11d. For the corresponding period last year:—Wheat, 39s. 7d.; Barley, 36s. 11d.; Oats, 20s. 1d.

## CATTLE.

At the Metropolitan Market on Monday there was a larger number of beasts than on the previous Monday, with a fair demand, yet owing to the increased supply Thursday's advance was not sustained throughout. For sheeptrade was very slow, and prices not at all improved. Choicest qualities were readily disposed of, but inferior difficult of sale. The calf trade was unaltered. Quotations:—Beasts, 4s. 6d. to 5s. 2d., and 5s. 6d. to 6s. 2d.; calves, 5s. to 6s.; sheep, 5s. 2d. to 5s. 6d., and 6s. to 6s. 10d.; pigs, 4s. to 4s. 10d.—Thursday's cattle trade was very dull. Both beasts and sheep were difficult to sell, and were quoted 2d. to 4d. per 8 lb. lower. Calves also were flat and weak.

## HAY.

Tuesday's Whitechapel Market report states that the trade was steady, at the following quotations:—Prime Clover, 100s. to 129s.; inferior, 70s. to 95s.; prime meadow hay, 80s. to 95s.; inferior, 30s. to 75s.; and straw, 30s. to 37s. per load.—On Thursday there was a moderate supply of hay and straw on sale. With a rather quiet trade prices were unchanged.—Cumberland Market quotations:—Superior meadow hay, 92s. to 100s.; inferior, 42s. to 74s.; superior Clover, 120s. to 128s.; inferior, 70s. to 105s.; and straw, 35s. to 40s. per load of 36 trusses.

## POTATOS.

From the Borough and Spitalfields Markets reports we learn that the demand continues pretty good and prices firm. German reds have been specially in request, at 6s. to 7s. 6d. per hundredweight. Scotch Regents, 140s. to 160s.; do. Champions, 140s. to 150s.; Lincoln Regents, 140s. to 150s.; Victorias, 160s. to 180s.; French whites, 85s. to 95s. per ton. Belgian kidneys, 5s. 3d. per hundredweight.—The imports into London last week comprised 9230 bags from Hamburg, 1000 from Harlingen, 785 Rotterdam, 600 Bremen, 301 bags 102 sacks Boulogne, and 183 bags Ghent.

## COALS.

The prices current at market during the week were as under:—Beaside West Hartley, 14s. 3d.; East Wylam, 16s.; West Hartley, 14s. 3d.; Walls End—Hetton, 16s. 6d.; Hetton Lyons, 15s.; Lambton, 16s.; Original Hartlepool, 16s. 6d.; Wear, 15s.; Chilton Tees, 15s. 6d.; East Hetton, 16s.; South Hartlepool, 15s. 3d. and 15s. 6d.; Hawthorns, 15s. 3d.; South Hetton, 16s. 6d.; Tunstall, 15s.; Chilton Tees, 15s. 6d.; Tees, 16s. 3d.

Government Stock.—The closing prices of Consols on Monday were, for delivery, 97½ to 97½; for the account, 97½ to 97½. The final quotation on Tuesday, Wednesday, and Thursday, for both delivery and the account, was 97½ to 97½.

The following is an additional List of celebrated Nurserymen, Gardeners, and Growers for Covent Garden Market, who have permitted us to state that they are using this Manure with the most successful results, and are willing to give particulars to any one applying to them. It is very gratifying to be allowed to publish such a List, as the names of many of these gentlemen have never before been published in connection with any article of commerce. Further lists to follow:—

JAMES VEITCH & SONS ..	Royal Exotic Nursery, Chelsea
E. G. HENDERSON & SON ..	Pine-apple Nursery, Maida Vale
B. S. WILLIAMS .. ..	Victoria and Paradise Nurseries, Holloway
HUGH LOW & CO. .. ..	Clapton Nursery, Clapton

**GAWITH'S FIREFLY CIGARETTE,**  
for destroying Thrip, Greenfly, and other greenhouse Pests. The advantages of fumigation over all other methods of destroying these enemies must be apparent to all horticulturists. However skilfully applied, insect-destroying powders cannot reach every one, whereas by rendering the atmosphere of a house destructive, all are reached. These Cigarettes are clean and effective; one trial is enough to convince the most sceptical that a long-looked-for handy and clean destroyer has at last been found. The Cigarette merely requires suspending by the wire attached, lighting at each end as in ordinary fireworks, and does its own work without further attention.  
Price 1s. 6d. each. To be had from Seedsmen, and from JOHN E. GAWITH, Sole Manufacturer, Lowther Street Tobacco Manufactory, Kendal.

One Fume effectually destroys the whole family of  
**APHIDES.**

Two Fumes in quick succession will annihilate the

Rosher's Garden Edging Tiles.

**THE ABOVE** and many other PATTERNS are made in materials of great durability. The plainer sorts are specially suited for KITCHEN GARDENS, as they harbour no Slugs or Insects, take up little room, and, once put down, incur no further labour or expense, as do "grown" Edgings, consequently being much cheaper.

**GARDEN VASES, FOUNTAINS, &c.**, in Artificial Stone, very durable and of superior finish, and in great variety of design. F. ROSHER AND CO., Manufacturers, Upper Ground Street, Blackfriars, S.E.; King's Road, Chelsea, S.W.; Kingsland Road, E.

Agents for LOOKER'S PATENT "ACME FRAMES," PLANT COVERS, and PROPAGATING BOXES; also for FOXLEY'S PATENT BEADED GARDEN WALL BRICKS.

Illustrated Price Lists free by Post. The Trade supplied.

**ORNAMENTAL PAVING TILES,**  
for Conservatories, Halls, Corridors, Balconies, &c., from 3s. per square yard upwards. Pattern Sheet of Plain or more elaborate Designs, with Prices, sent for selection.

**WHITE GLAZED TILES,** for Lining Walls of Dairies, Larders, Kitchen Ranges, Baths, &c. Grooved and other Stable Paving of great durability, Wall Copings, Drain Pipes and Tiles of all kinds. Roofing Tiles in great variety, Slates, Cement, &c. T. ROSHER AND CO., Brick and Tile Merchants.  
See Addresses above.

**SILVER SAND,**  
fine or coarse grain as desired. Price by post per Ton or Truckload, on Wharf in London, or delivered direct from Pits to any Railway Station. Samples of Sand free by post. FLINTS and BRICK BURS for Rockeries or Ferneries. KENT PEATS or LOAM supplied at lowest rates in any quantities.

A Photograph will be sent on application to J. GROVER, Builder, Wilton Works, New North Road, London, N.

**COALS FOR HOTHOUSE PURPOSES.**

**WOOD AND CO.'S STAR ANTHRACITE SMOKELESS STEAM COAL**

is now being extensively used by many of the principal Growers, and is found to be preferable to any other kind of fuel in respect to cheapness and durability, and particularly on account of its being perfectly free from sulphur, and that it does not clinker the fire-bars.

WOOD AND CO. deliver in truckloads to any Railway Station, prices for which can be had on application, or can be delivered by Wood & Co.'s Vans (in the Metropolis).

WOOD AND CO. append a testimonial given to them by Messrs. Beckwith & Sons, a firm of great experience, and who have kindly allowed them to make whatever use of it they may think fit.

Tottenham Nurseries, London, N., Dec. 28, 1877.

To Messrs. Wood & Co.  
Dear Sirs,—With reference to your enquiry respecting the "Star" Anthracite Coal with which you supplied us—as to how it suited, its economy or otherwise—we have much pleasure in informing you that in every respect it is the best Anthracite we have ever used. We find there is no smoke from it, which is very essential, and there is no trace of sulphur. It requires very little stoking, and leaves very little ash, and certainly does not clinker. Our consumption of coal is about 500 tons a year, and we have no hesitation in saying that, by using your "Star" Coal in the place of ordinary fuel, we shall effect a saving of at least £100 this year. We attribute this to the powerful and lasting properties of your Coal.—Yours faithfully,  
(Signed) G. BECKWITH & SONS.

WOOD AND CO. supply all kinds of Coal for House and Manufacturing purposes, in single truckloads, to any Railway Station, at Wholesale rates, prices for which will be sent on application.

WOOD AND CO., Coal and Coke Factors, Merchants, Contractors to Her Majesty's Government, 58, Coal Exchange, E.C.; and 4, Coal Department, Great Northern Railway, King's Cross, N.; and Midland Sidings, St. Pancras, N.W.; 94, High Street, Kensington; Lodon, Chatham and Dover Railway Coal Depot, Elephant and Castle; and Great Northern Railway Coal Depot, Sydney Road, Hackney Wick, E.

### HELLIWELL'S PATENT

All outside Wood is covered. No Painting Required.  
Cost of House Saved in Ten Years. No Rattle or Looseness of Squares. No Breakage from Expansion or Contraction. Squares instantly replaced. TESTIMONIALS.—'Sir: I went yesterday and examined the glass roof glazed by you, under my directions, at Sandringham, for H.K.H. the Prince of Wales, and find it perfectly satisfactory in all respects. The appearance is vastly superior to the old system of wood and putty, and I shall be glad to recommend it whenever I can. Yours faithfully (Signed) C. Smedley Beck, Architect. T. W. Helliwell, Esq.'—'Mark Lane, London, Nov. 14, 1878. Dear Sir: I cannot see what Testimonial you can require from me, than the fact that I have taken off all my putty glazings, and removed —'s work to replace it with yours. Any one seeing the two systems would say that yours is far the superior, and that nothing yet out can touch it. Yours, W. R. Preston. T. W. Helliwell, Esq., Brighouse.' For Estimates, Drawings, or Particulars, apply to the Patentee, T. W. HELLIWELL, Brighouse, Yorkshire.

PARTNERSHIP.—Wanted, in an old-

established Seed and Nursery Business in the Eastern Counties, a Partner with £700 to £800 capital, to take the place of one who is unable to take an active part in the management. Thorough investigation granted to any suitable applicant.—Apply by letter only, to OMEGA, Reform Club, Liverpool.

To Gardeners.

WANTED, a steady intelligent MAN as First Hand, who thoroughly understands Vines, Glass, &c., and is competent to undertake the sole charge of a small Kitchen and Pleasure Garden.—Apply (stating salary, &c.) to WILLIAM CLINTON, Estate Agent, &c., High Street, Aldershot, Hants.

WANTED, a GARDENER and PORT-

RESS.—The Board of Management of the Brentwood School District require the services of a Married Couple, without children, as Gardener and Portress, at the District Schools, Brentwood, Essex. Salary, £30 per annum for the Man and £10 per annum for his Wife, with furnished lodge, rations, and washing. The Man must be able to Train the Boys in Practical Gardening.—For particulars of duties apply to the Superintendent of the Schools. Applications must be made upon forms to be obtained at my office, to be returned not later than TUESDAY, Jan. 20 inst., endorsed "Gardener and Portress."

By order, ROBERT CLAY, Acting Clerk.  
213, Kingsland Road, London, E., Jan. 2, 1880.

WANTED, a WORKING GARDENER.

—Steady; must especially and thoroughly understand the Growing of Roses, Indoor and Outdoor, also Pelargoniums and other Greenhouse Plants, and he will be required to make himself generally useful about the place.—Address, stating qualifications and wages expected, W. OWEN, Silverdale, Oxtou, Cheshire.

WANTED, as GARDENER (SINGLE-

HANDED), in a small situation in the suburbs, a skilled Orchid Grower. Age not under 30 nor over 40. Must have at least three or four years' good personal character.—Apply at Messrs. VEITCH AND SONS, King's Road, Chelsea, S.W.

WANTED, a BAILIFF and GARDENER,

to Manage Estate of 300 acres, and Superintend Large Garden. Must be thoroughly up to all Farm Work, energetic, and have a good character. State age, what family, previous employment, and wages.—R. AND CO., 35, Lincoln's Inn Fields, London, W.C.

WANTED, an UNDER GARDENER, for

Kitchen Garden and General Outdoor Work. Must have good references. Age from 30 to 45; single preferred.—J. ANDERSON, The Gardens, Streatham Grove, Norwood.

WANTED, a FOREMAN for the Houses,

within 18 miles of London. Well up in his work. Must be strong, quick, and willing. Also a JOURNEYMAN, used to Fires and General Work, strong and active. Wages 18s. and 13s. per week, with Bothy.—GARDENER, Davies & Co., Advertising Agents, Finch Lane, Cornhill, E.C.

Gardener and Cook.

WANTED, Man and Wife—former as

GARDENER (SINGLE-HANDED), and Wife must be good COOK. For the country, near the seaside, to take charge. Ages not under 30, nor over 40. Good personal characters required. No incumbrances.—Apply by letter, stating particulars and wages wanted, to W. HOWARD, Fleet Club, 7, Gough Square, London, E.C.

WANTED, a respectable Man, who knows

his business, as GARDENER and GROOM, and to Drive when required, for the vicinity of the Crystal Palace.—Appy, Mr. HEATH, 61, Southwark Street, Epsom, S.E.

WANTED, AT ONCE, a first-class

GENERAL PLANTSMAN, to Grow for Market and produce a regular supply of Cut Flowers. One from a market nursery preferred. Progressive salary to a competent and trustworthy man.—TURNER BROS., Green Hill Nursery, Garston, Liverpool.

WANTED, a young Man, well up in

Propagating all kinds of Plants suitable for the London Markets, and to make himself generally useful. None need apply unless having a thorough knowledge of the Market Work.—F. BAKER, Plumstead Nursery, Plumstead, Kent.

WANTED, a young Man as Soft-wooded

PROPAGATOR and GROWER. State wages required to E. COOLING, Mile Ash Nurseries, Derby.

WANTED, in a Small Nursery, a good

steady MAN, to do Propagating and General Nursery Work. Must be able to Bud Roses. Wages 22s. per week. None need apply unless with good character.—CARTER, PAGE AND CO., 53, London Wall, London, E.C.

**WANTED**, an active young Man, of good character, to Lead the Work in a Kitchen Garden. Must be an efficient workman. Will have charge of several men. Wages 17s. per week, with lodging and firing.—Apply, with references, to GARDENER, Mr. Rowe, Barbourne Nurseries, Worcester.

**WANTED**, a sober industrious MAN, used to General Nursery Work. State wages expected, reference, &c., to J. BRYSON, Parkend Nursery, Helensburgh, N.B.

**WANTED**, a SHOPMAN and ASSISTANT SHOPMAN, in a Wholesale Seed Warehouse.—Apply, by letter, stating amount of experience and wages required, to A. F. Gardeners' Chronicle Office, W.C.

**WANTED**, an active, honest, and experienced Young MAN, in an Agricultural Seed Store, to take charge of Delivery Orders, &c. None but those who have a thorough knowledge of Qualities, Trying Growths, &c., and can furnish the highest testimonials, need apply. State lowest salary.—G. M., Hurst & Son, 6, Leadenhall Street, E.C.

**WANTED**, for the Counting-house, a good WRITER, accustomed to Invoicing. Salary at the rate of £70 per annum.—Address application with particulars of experience, "B. S.," Barr & Sugden, 12, King Street, Covent Garden, W.C.

**WANTED**, a steady, respectable Youth as APPRENTICE in the Seed Business. Good references required.—Apply to E. WILSON SERPELL, 21, Cornwall Street, Plymouth.

**WANT PLACES.**

**B. S. WILLIAMS** begs to intimate that he has at present in the Nursery and upon his Register some excellent Men, competent either to fill the situation of HEAD GARDENER, BAILIFF, FOREMAN, or JOURNEYMAN. Ladies and Gentlemen requiring any of the above will please send full particulars, when the best selections for the different capacities will be made.—Holloway, N.

**TO SANITARY AUTHORITIES.**—JAS. MYATT, Market Gardener, is prepared to undertake the Management of a Sewage Farm, and will be happy to treat, by letter in the first instance, with the representative of Local Towns.—JAMES MYATT, Myland, Colchester.

**TO NURSERYMEN and SEEDSMEN.**—A young man (age 24) desires an engagement, Managing or Working. Has thorough good knowledge of Outdoor Nursery Work; also well up in the Seed Trade. Can keep books and correspond. Character will bear the strictest investigation.—A. B., Mrs. Sharp, Raeburn Place, Edinburgh.

**TO GENTLEMAN and MARKET GROWERS.**—Advertiser would undertake to Manage a Business for a Gentleman, with a large amount of Glass, or intending to Build, to grow on an extensive scale entirely for Market, Grapes, Peaches, Strawberries, Mushrooms, Cucumbers, &c. Also choice Flowers, best adapted to supply a first-class Cut Flower Trade demand. First-class references.—HORTUS, 5, Duffield Street, Battersea, S.W.

**GARDENER (HEAD)**, where three or more are kept.—Age 35, married; thoroughly practical in all branches of Gardening.—WM. POLMEAR, Bohun Lodge, East Barnet, Herts.

**GARDENER (HEAD)**.—Age 30; can be highly recommended. No Single-handed place accepted.—C. SPALL, 11, Mexican Terrace, Caledonian Road, King's Cross, N.

**GARDENER (HEAD)**.—Age 32, married; thoroughly experienced in Plant and Fruit Growing, Early and Late Forcing, Flower and Kitchen Gardening, &c.—GARDENER, 4, Northfield Place, Ealing, Middlesex.

**GARDENER (HEAD)**; age 30.—Mr. PRATT would be pleased to recommend his Foreman, Robert Pegg, to any Lady or Gentleman in want of a steady, industrious man. Has lived in some of the leading places in the country. Understands the profession in all its branches.—Hawkstone Gardens, Salop.

**GARDENER (HEAD)**.—Age 37, married; thoroughly understands Vines, Pines, Peaches, Stove and Greenhouse Plants, Orchids, and Kitchen, Fruit and Flower Gardening. Land and Stock if required. Three and a half years' unexceptional character.—A. B., Pixholme Lane, Dorking, Surrey.

**GARDENER (HEAD)**; age 26.—Mr. H. A. MANN would be pleased to recommend William Wenman, a practical man throughout the profession. He has filled the place as General Foreman at St. Vincent's for upwards of two years to my satisfaction.—H. A. MANN, St. Vincent's, Grantham.

**GARDENER (HEAD)**; age 45, married, one child (age 16).—Mr. BAINES, Southgate, London, N., can recommend to any Nobleman or Gentleman, in want of a Gardener, a thoroughly intelligent and trustworthy man, who has not adopted the calling simply for a living, but has from boyhood been heart and soul in the pursuit. Is one of the best Fruit, Plant, and Vegetable Growers in the country. Fully capable to plan and carry out new work or alterations, including Horticultural Buildings. Can be highly recommended by the gentleman he has served as Head Gardener for nine years.—Address as above.

**GARDENER (HEAD, WORKING)**.—Age 36, married; a thoroughly practical man, competent to manage a first-class garden. Five years' good character.—J. FORD, 2, Whatman Road, Forest Hill, S.E.

**GARDENER (HEAD, WORKING)**.—Age 36; thoroughly understands Vines, Peaches, Melons, Stove and Greenhouse Plants, Flower and Kitchen Gardening.—H. N., Fearsale Cottage, Dartmouth Park Hill, Highgate, N.

**GARDENER (HEAD, WORKING)**, where three or more are kept.—Married, one child; well up in the culture of Stove and Greenhouse Plants, including Orchids, Fruits, Flowers, and Vegetables. Leaving through death.—E. DAVIES, Stæpenhill, Burton-on-Trent.

**GARDENER (HEAD, WORKING)**.—Age 32, married, one child; understands Vines, Peaches, Melons, &c.; also Flower and Kitchen Gardening, or the Laying-out and Planting of a new place.—HORTUS, Railway Bookstall, Starrogate.

The Medical Profession for over Forty Years have approved of this pure solution as the Best Remedy for

**ACIDITY OF THE STOMACH, HEARTBURN, HEADACHE, GOUT, AND INDIGESTION,**

and as the safest Aperient for Delicate Constitutions, Ladies, Children, and Infants.

**DINNEFORD'S MAGNESIA.**

**Freedom from Cough is Insured by**

**DR. LOCOCK'S PULMONIC WAFERS.**—From J. W. F. COUNSELL, Bookseller, Ross:—"I hear your Wafers highly spoken of by those who use them. I have found them excellent in coughs myself." They give instant relief, and a rapid cure to Asthma, Consumption, Colds, Bronchitis, and all disorders of the Breath and Lungs. To singers they are invaluable. They taste pleasantly. Price 1s. 1/2d., and 2s. 9d. per box.

**HOLLOWAY'S PILLS** can be confidently recommended as a domestic remedy for the ailments of all classes and conditions of people. Young and old of both sexes may take this medicine with the certainty of deriving benefit from its use, when disorder or disease is making them miserable. Holloway's Pills are unrivalled for their purifying, aperient, and strengthening properties. They remove Indigestion, Palpitation, and Headache, and are specially serviceable in complaints peculiar to females. Each box is wrapped with printed instructions for the guidance of invalids who will readily understand, from carefully studying them, the best way of recovering health. Holloway's Pills will work a thorough change in the constitutions of the weak and nervous.

To His Royal Highness

the Prince of Wales.

AWARDED THE GOLD, SILVER, AND OTHER MEDALS  
OF THE  
ROYAL HORTICULTURAL SOCIETY  
FOR  
EXCELLENCY OF FLOWERS.

To Her Most Gracious

Majesty Queen Victoria.

It is of the utmost importance that you have your Flower Seeds in particular from those who have the finest strains, the best climate and the greatest facilities for growing and saving such, and what is of more importance where the grower and saver is passionately fond of them, and devotes his whole life's study to the production of the same. No expense, time, or trouble is spared to have the best varieties, and many are known to be far ahead of those usually offered: not a day passes *without every known science and skill being applied* to bring all the most popular flowers nearer and nearer to perfection, and the result of such is most remarkable and at once perceived in my house of Primulas, which is now a grand sight, and for colour never before equalled. My constant exhibits before the Floral Committee throughout the year elicited the highest eulogies from the entire Press, and obtained numerous awards. Notwithstanding the unfavourable season, my stock is by far the finest and choicest I ever had, and cannot fail to bring pleasant charms of excellence into every garden where sown, for it is everywhere admitted that the *Swanley Flower Seeds are known and appreciated the whole length and breadth of the civilised World.*

# SEED FOR SOWERS.

From the CHRISTIAN UNION:—"MR. CANNELL'S 'HOME FOR FLOWERS,' at Swanley, Kent, is known to all florists for its varied excellences, but it is well that it should be known to multitudes who may not be professional florists, but who have a really good and natural liking for a pretty flower or plant in their private gardens, verandahs or window sills. Everything in the enjoyment to be obtained from this period onward through the season depends on the stock from which the seeds or plants are derived. Mr. Cannell's establishment at Swanley is devoted exclusively to florists' flowers, and is probably the only one in the kingdom of which this can be said: and as Mr. Cannell himself is a Fellow of the Royal Horticultural Society, every one may judge what results ensue from a highly specialised direction of this kind under the most ample science and experience. In looking over the Descriptive Catalogue of Seeds one perceives the immense variety of genera and species therein embraced; but the testimonials appended are still more convincing, and carry a more palpable weight of evidence to the general mind. The testimonials come not only from every quarter of the United Kingdom, but from India, Australia, and other parts of the world to which English culture in other forms has so widely and permanently spread. His Seeds are of the highest excellence. *It is one of the greatest of all the wonders in the floral culture of this country.*"

From Dr. SCHOMBURGK, *Botanic Gardens, Adelaide.*—"Seeds safe to hand, and which have turned out well."

From J. D. HATTON, Esq., *Launceston, Tasmania, February, 17, 1879.*—"Dear Sir,—The seeds arrived in splendid condition, just at suitable season, and are growing fine."

From Mr. R. TAYLOR, 5, *Rose Street, Beverley Road, Hull, January 13, 1879.*—"The seeds purchased from you for the last two years have given every satisfaction."

From S. V. HOFMEYR, Esq., *Cape Town, October 7, 1879.*—"Dear Sir,—All the seeds received from you which I have sowed come up well."

From Messrs. DUNCAN & SON, *Nurserymen, Christchurch, New Zealand, September 13, 1879.*—"Dear Sir,—The seeds arrived in good order."

From Mr. WILLIAM ANDEAN, *Victoria, Vancouver's Island, British Columbia, November 5, 1878.*—"Dear Sir,—The seeds came to hand in good order last spring. The seedlings are turning out well."

From Mr. S. OWEN, Jun., *West Maitland, New South Wales, Australia.*—"The last flower seeds sent by you were very good. I think every seed of the Cyclamen germinated. I got about 100 plants from the packet, and are now coming into flower. Polyanthus particularly good—the flowers measured 5 inches across the truss."

From Mr. G. H. MCCOLLEY, *Public School, Blacktown, via Sydney, N. S. Wales, October 27, 1879.*—"I am happy to say that your seeds have proved highly satisfactory both in germinating power and quality, and was honourably mentioned by the Parramatta Horticultural Society. Send off enclosed order soon as you can."

From Mr. E. B. CONRAD, *Winona, Ohio, U. S. America, May 7, 1879.*—"The seed I purchased of you of Carnation and Peottee did well, and I have had some very handsome sorts which are very much admired; colours beautifully bright and size good."

From A. J. ROLLO, Esq., *Holly Bank, Simla, India.*—"I have seen the plants from your seeds, and also your plants sent out to people in this country, and they are excellent. I have every confidence you will send me good things."

From Mr. W. WEDD, *Mount Gambier, South Australia.*—"Dear Sir,—I have to thank you for sending my parcel of seeds, which arrived in first-rate condition within three months of date of order; this, considering the distance, is extraordinary dispatch, and enabled me to get a sowing in good time. As a proof of their good quality they are already above-ground."

From J. H. BARKER, *Pine Grove Cemetery, Lynn, Mass., U. S. America, November 28, 1879.*—"The seeds you last sent me proved highly satisfactory."

From Mr. C. BROWN, *Gardener, South Field House, Louth, Lincoln, February 24, 1879.*—"The packet of Begonia seed I had of you last year gave me many seedlings far better than those in my named collection. One had six petals measuring 4 inches over—the grandest I ever saw."

From Mr. J. BOX, *Carr Nursery, Doncaster, August 2, 1879.*—"The Primula seed you sent, every one has grown. I have a grand lot."

From Mr. A. MESTON, *Anguston, Peterculter, N. B., March 22, 1879.*—"The Beta from your seed were greatly admired in this quarter last year."

From Mr. FOSTER BERRY, *Nab Mirfield, August 4, 1879.*—"Dear Sir,—The Marigolds from your seed are coming splendid. I am more than pleased with them."

From Mr. JOHN KING, *Brislincote House, Burton-on-Trent, August 25, 1879.*—"Dear Sir,—The Asters and Marigold seed I had from you have turned out very good. I took the 1st prize last week at Burton Show with the Marigolds."

From Mr. J. EVERETT, *Wood Lane, Handsworth, Birmingham, April, 1879.*—"Your Hollyhock seed has turned out really beautiful double flowers."

From Mr. JOHN CLARKE, *Plough Road, Wellington, Shropshire, February, 1879.*—"Your Hollyhocks and Asters are without exception the finest seen this season."

From Mr. J. LITCHFIELD, *Gardener to Lord Chas. Russell, Woburn, Beds, May 16, 1879.*—"I thank you very much for sending me seed of such good quality."

From W. C. KEY, Esq., *Cypress Lodge, Walton-on-Thames, May 17, 1879.*—"The Petunia and Primula seed I had from you came up capitally, and I have, from the Primula seed, 200 nice young plants, in 60's."

From Mr. W. CORDEN, *Penistone, near Sheffield, September 30, 1879.*—"Out of the 2s. 6d. packet of Primula seed I got for my friend from you, he had 130 plants, and at the present time they are really magnificent. The Petunias and Balsams also turned out first-class. We had some splendid things amongst them."

From Mr. G. FLETCHER, *Gardens, Moss Bank, Bolton, April, 1879.*—"I had a fine crop of Cucumbers from seed I had of you last season—the best in these parts."

From Mr. A. MACKIN, *Town Hall Buildings, Banbury, August 5, 1879.*—"The Balsam seed I had of you in the summer has turned out well. We have had some beautiful flowers."

From Mr. E. EADE, *Gardens, Edenthall, Penshurst, August, 1879.*—"Dear Sir,—The Balsams from your seed are the finest I ever saw, measuring 3 inches in diameter. My employer is well pleased."

From Mr. G. BOND, *Walcot Gardens, Lydbury North, Shropshire, September 25, 1879.*—"Dear Sir,—I feel bound to tell you that late as my Balsams were sown, from your packet of seed, they have far exceeded my expectations—beautifully double, and are the best decidedly I ever saw."

From W. KITTO GIDDINGS, Esq., *Shaftesbury House, Calverley, near Leeds, March 1, 1879.*—"The bed of Antirrhinums last year from your seed was delightful."

ADNITT and NAUNTON, Hon. Secs.  
The Square, Shrewsbury.

Seeds—Seeds—Seeds.

WM. CUTBUSH and SON draw special attention to their Choice Stocks of the above. For description, see CATALOGUE, post-free on application. Highgate, London, N.; and Barnet, Herts.

Bedding Roses.

CRANSTON'S CRIMSON BEDDER.—No Garden should be without a bed of this brilliant crimson and perpetual flowering bedding Rose. (Hundreds of testimonials.) Strong ground plants 10s. per dozen, 75s. per 100. Other choice select Roses for bedding, 60s. to 75s. per 100. CRANSTON'S NURSERY and SEED CO. (Limited), King's Acre, near Hereford.

Special List of Cheap Ferns.

THE ABOVE SPECIAL LIST of a large number of varieties of FERNS and SELAGINELLAS, offered at very low prices, will be forwarded on application. Ferns being our Speciality, and having an immense stock, we are able to supply them at the most reasonable prices. W. AND J. BIRKENHEAD, Fern Nursery, Sale, near Manchester.

W. BALL and CO. have many thousands of WINTER and SPRING BEDDING PLANTS; also a large quantity of HERBACEOUS and ALPINE PLANTS, at very low Prices to the Trade and large Buyers. Price LISTS forwarded on application. Bedford Road Nursery, Northampton.

SPRUCE FIRS for Christmas Trees, well formed, 3 to 4 feet, 30s. per 100; 4 to 5 feet, 40s. per 100. RICHARD SMITH and CO., Nurserymen, Worcester.

1880.

Messrs. SUTTON'S PRIZES FOR VEGETABLES, POTATOS, &c.

ALL GARDENERS WHO INTEND COMPETING For the above Can have full particulars on application.

SUTTON & SONS, THE QUEEN'S SEEDSMEN, READING.

SEED POTATOS.—Snowflake, Early Rose, Myatt's Prolific, Fortynfold, Breeley's Prolific, Early Shaw, Paterson's Victoria, Regent, Dalmahoy, Fluke, Champion (Scotch), Redskin Flourball, and other leading varieties. Prices on application to JOSIAH H. BATH, York Street, Borough Market, S.E.

To the Trade. MAGNUM BONUM POTATOS. H. AND F. SHARPE can supply the Trade with a very true stock of the above-named POTATO, grown from carefully selected tubers. It is one of the best disease-resisting varieties in cultivation. Further particulars as to price, &c., may be had on application. Seed Growing Establishment, Wisbech.

KITCHEN GARDEN AND FLOWER SEEDS, ALSO GLADIOLI ROOTS, &c. DOWNIE AND LAIRD have posted their CATALOGUES of Kitchen Garden and Flower Seeds, including Gladioli Roots, &c., to all their customers; if however, by any chance they have not been received, and their friends will kindly let them know, a copy will be forwarded in course of post. DOWNIE AND LAIRD, Seedsmen and Nurserymen, 17, Frederick Street, Edinburgh.

JAMES BACKHOUSE AND SON'S Priced LISTS of VEGETABLE and FLOWER SEEDS are now ready, and will be forwarded post-free on application. The FLOWER SEED LIST will be found to contain an excellent assortment of Perennial and Rock Plants, which have been saved from their well known Collection; to which is added a well assorted descriptive list of Gladioli Roots. JAS. BACKHOUSE AND SON, The Nurseries, York.

SPECIAL CHEAP OFFER TO THE TRADE. APPLES, Pyramid, extra strong and well rooted, 40s per 100. PEARS, Pyramid and Standard, extra strong and well rooted, 50s. per 100. CHERRIES, Standard trained, } Prices and sorts on PLUMS, Standard trained, } application. PEARS, Dwarf trained, } SPRUCE, Norway, 2 to 3 feet, very bushy and well rooted, 40s. per 1000. THUJOPSIS BOREALIS, 5 to 6 feet, 24s. per dozen; 6 to 7 feet, 30s. per dozen; 7 to 8 feet, 48s. per dozen. W. G. CALDWELL AND SONS, The Nurseries, Knutsford.

To the Trade. "PRIDE OF ONTARIO" POTATO. H. AND F. SHARPE are now offering the above excellent POTATO, grown from their original stock. It gave universal satisfaction last season, having produced a fine yield, and comparatively free from disease. As the stock this season is limited early orders are requested. Seed Growing Establishment, Wisbech.

LILIUM AURATUM.—English grown far superior to Imported. Fine Bulbs, in three sizes, 12s., 18s., and 30s. per dozen respectively. A few, extra large, at 3s. 6d. each. HOOPER AND CO., Covent Garden, London, W.C.

LEICESTER RED CELERY has again proved itself to be the hardiest, sweetest, most solid, and best Celery this unfavourable season; when most kinds have been soft and watery this has been good in every way. Those wishing to obtain the true article should have it in printed packets, price 1s.; post-free on receipt of 13 stamps. BROCCOLI, Harrison's new Dwarf Hardy; a late valuable kind, 1s. per packet. SAVOY, Harrison's King Coffee Garden, 1s. per packet. TURNIP, Harrison's Exhibition; a perfect round white variety, from 6d. per packet. CARROT, Harrison's Early Market, 6d. per packet.

HARRISON'S "LEICESTER SEEDS," of the choicest quality, are supplied in collections of 21s. and upwards, sent carriage free. Trade Prices and full particulars on application to HARRISON AND SONS, Seed Growers, Leicester.

To the Trade. SEEDLING and TRANSPLANTED FOREST TREES, and other useful HARDY NURSERY STOCK always in demand. Priced LIST on application. W. P. LAIRD AND SINCLAIR, Nurserymen, Dundee, N.B.

TREE SEEDS.—TABIES DOUGLASSII, post-free, 2s. 6d. per ounce. MENZIESII, post-free, 4s. per ounce. PICEA NOBILIS, post-free, 4s. per ounce. PINUS MONTICOLA, post-free, 3s. per ounce. LARCH, Native, 2s. per pound. The above are all of crop 1879, and collected from Trees grown in Scotland, and may be fully relied on for purity and hardness. Special prices for large quantities, and to the Trade on application. BEN. REED AND CO., Nurserymen and Seedsmen, Aberdeen.

New Cucumber, Sir Garnet Wolseley. JOSEPH HAMILTON AND SON, Wellington Place, near Carlisle, will supply SEEDS of the above, in Packets of 6 Seeds, post-free for 30 stamps. The points in which Cucumber Sir Garnet Wolseley surpasses all other long-fruited varieties are the symmetry of its fruit, and the abundance with which they are produced; there being no shank or handle to Sir Garnet.—Gardener's Chronicle, September 27, 1879.

To the Trade. HOME-GROWN GARDEN and FIELD SEEDS. H. AND F. SHARPE are prepared to make special offers of their choice stocks of HOME-GROWN GARDEN and FIELD SEEDS to those who have not yet completed their supplies for the coming season. Seed Growing Establishment, Wisbech.

CHESTNUTS, Common, 6 to 7 feet stems, fine heads, 75s. per 100. ELMS, Standard Italian, 6 to 7 feet stems, fine heads, 9s. to 10s. per 100. ASH, Common, 2 to 3 feet, 23s. per 1000. [100s. per 100. BEECH, Common, strong, 5 to 7 feet, 25s. per 100. HORNBEAM, strong, 3 to 5 feet, 25s. per 1000. QUICK, very strong, 3-yr., 15s. per 1000. BLACKTHORN, very strong, 3-yr., 15s. per 1000. HOLLY, Green common, fine, 3 to 4 feet, 50s. to 60s. per 100. LAUREL, Portugal, very fine, bushy, 3 to 3½ feet, 60s. to 70s. per 100. YEW, Common, fine Pyramids, 3 to 4 feet, and 4 to 5 feet, 90s. to 100s. per 100. well rooted, 3 to 4 feet, 60s. to 70s. per 100. ROSES, fine Standards, 4 feet stems, large heads, our selection, 70s. to 75s. per 100.

**WILLIAM FLETCHER**, Ottershaw Nurseries, Chertsey, will be glad to quote prices to the Trade, as named:—  
 BIRCH, 2 to 3 feet, 3 to 5 feet, and 5 to 8 feet.  
 HAZEL, 2 to 3½ feet.  
 ASH, Common, 2 to 4 feet.  
 ALDER, 2 to 3 feet, 3 to 5 feet.  
 QUICKS, MANETTI STOCKS, &c.

**TREES FOR AVENUE, PARK, or STREET PLANTING.**  
 ACER DASYCARPUM, 14 to 16 feet, girting 5 to 7 inches.  
 CHESTNUT, Horse, 12 to 14 feet, girting 5 to 7 inches.  
 " Horse, Scarlet, 10 to 14 feet, girting 6 to 8 inches.  
 LIMES, 14, 15, 16, 18, and 20 feet, girting 6 to 10 inches.  
 PLANES, Occidental, 10 to 12 feet, girting 4 to 5 inches.  
 " Occidental, 12 to 14 feet, girting 5 to 6 inches.  
 A few hundred splendid PLANES, 16 to 18 feet, girting 8 to 10 inches.  
 POPULUS CANADENSIS NOVA, 12 to 14 feet, girting 6 inches.  
 MAPLES, Norway, 12 to 16 feet.

Westwood Park Late White Broccoli.

**RICHARD SMITH AND CO.**  
I have pleasure in again offering this excellent BROCCOLI, and respectfully solicit early Orders, as the stock this season is limited. Price 1s. 6d. per packet, the usual discount to the Trade.

From *The Gardener*, July, 1876:—"The most valuable Broccoli we have seen this year is a kind coming into use in June: it is very white, and of large size before the leaves expand, and though yet in a private garden, we hope to see it come into the public. It is growing in Westwood Gardens, near Droitwich, and Mr Gough, the gardener, has been saving seed from the finest heads for some years, and has been rewarded with great success."

Cucumber Plants kept on hand till June next.  
G. WALKLING, College Park Nursery, Lewisham, S.E.

**TREE PLANTING:**  
**AN INVESTMENT.**

That Timber Growing will be found to be a profitable application of the soil, and a sound investment to Capitalists in the future, is being made obvious by the increasing demand for Wood, and its anticipated scarcity in places abroad.

Nurseries have long been noted in Scotland for successfully and cheaply raising FOREST and other TREES, and the Subscribers devote every attention to conducting efficiently one of the largest establishments in the country.

In connection with their business arrangements Correspondents are respectfully reminded that their Priced CATALOGUES are sent, post-free, on application. The prices are quoted as reasonable as any. Plants are fibrous-rooted, robust, and grown unsheltered. Inspection of Nurseries invited, but if inconvenient, Samples of Trees will be furnished. Planting contracted for, Carriage Rates lessened, and Packages saved by using "Through Trucks." Export Orders carefully supplied, and Correspondence solicited.

Seed Growers and Merchants

ALSO  
NURSERYMEN FOR FOREST, ORNAMENTAL, AND FRUIT TREES,  
SHRUBS, AND ALL KINDS OF HOUSE PLANTS.

THE SCOTTISH CHAMPION POTATO.

THE CHAMPION POTATO has been most appropriately named, for, in Scotland at all events, it has thoroughly beaten every other variety in disease-resisting properties, and has lately been lifted at the rate of 10 to 12 tons an imperial acre, grown as an ordinary field crop. Having paid much attention to the Champion since it first appeared, we can fully endorse all that has been said in its praise, and certainly the past unfavourable season has proved it to be the most valuable introduction of the last few years. It originally came from Forfarshire, and, after trial, was recommended in the Lawson Seed List of 1875. In general appearance it comes between the Scotch Regent and the Irish Rock, embodying the good qualities of the former and the hardy constitution of the latter. Like other Potatoes, its eating quality varies according to circumstances as regards soil, climate, and cultivation, but it may safely be classed among good table sorts. The Champion is a strong, rank grower, and should be allowed a fourth more space at least than that which ordinary kinds require in planting. It is, perhaps, the latest field Potato to ripen, the haulm remaining fresh when that of all others is withered. It should, consequently, be planted earlier than is usual for late sorts generally in order to do it justice. It will grow remarkably well on poor soils where other kinds would not succeed, and altogether it is highly recommended for a main crop in every garden and farm. It cannot, however, be too prominently kept in view that to fortify its disease-resisting character a thorough change of seed is necessary.

We are now prepared to book Orders for fine Seed samples of the true variety, either for present or future delivery. Price per Ton on application.

*The Lawson Seed & Nursery Co.,  
Edinburgh and London.*

HOOVER'S CATALOGUE FOR 1880

IS OFFERED TO ALL WHO REQUIRE TO PURCHASE

SEEDS OF UNDOUBTED QUALITY.

In spite of a season of unprecedented badness, HOOPER & Co. are able to offer Seeds that will grow, and give satisfaction—an end that has been attained only by the most strenuous exertions and unusual diligence.

Hooper's Catalogue lays no claim to acceptance on the score of splendour either of covers or interior; it has no coloured pictures to amuse the fancy or to shock the artist; but is a plain and well-stored book of 100 pages, compiled to show what Seeds and Plants they have to offer, and to instruct the reader in all that is necessary about them. H. & Co. do not issue Grand Catalogues to sell, but have good Seeds to sell, and a good Catalogue to give away to all who wish to buy. On the other hand, though unembellished with the gilt and colour of many contemporaries, Hooper's Catalogue is a book which will not disgrace the library table. *Sent Free to all applicants.*

HOOVER & CO., COVENT GARDEN, LONDON, W.C.

THE BEST PLANTING SEASON. THE LAWSON SEED AND NURSERY COMPANY (Limited) respectfully invite attention to their Extensive Stocks of FOREST, ORNAMENTAL, and FRUIT TREES, Dwarf and Standard ROSES, Vines, &c., all in splendid condition. Where personal inspection is not convenient, special offers will be made, and CATALOGUES sent on request.

Special Railway Tickets to and from the New Nurseries, Granton Road, may be had gratis, at 1, George IV. Bridge, Edinburgh.

Peat Charcoal TO MANURE MERCHANTS, AGRICULTURISTS, IRONFOUNDERS, and TINPLATE WORKERS.

THE WEST OF ENGLAND COMPRESSED PEAT COMPANY (LIMITED) are prepared to negotiate for the constant SUPPLY, from a period to be agreed on, of from 150 to 300 tons of PEAT CHARCOAL per week, Ground or Unground.

Ground Charcoal, with certain cheap ingredients added, is the most efficacious Manure, at its cost price, to be obtained in the Market.

The Nitrogen it contains is alone worth about 30s. a ton. It is cheaper and more profitable than Straw for Bedding for Cattle. For Manufacturing Iron or Steel, or for Tinplate Workers, it cannot be equalled as a Smelting Fuel, being wholly free from Sulphur. Applications to be made to

Mr. R. W. HEAD, Secretary, 15, Bedford Circus, Exeter.

Fibrous Peat for Orchids, &c. BROWN FIBROUS PEAT, best quality for Orchids, Stove Plants, &c., 6s. 6d. per truck. BLACK FIBROUS PEAT, for Rhododendrons, Azaleas, Heaths, American Plant Beds, 15s. per ton. Delivered on rail at Blackwater, S. E. R., or Farnborough, S. W. R., by the truckload. Sample bags, 4s.; 5 bags, 20s.; 10 bags, 36s. Bags, 4d. each. Fresh SPHAGNUM, 10s. 6d. per bag. WALKER AND CO., Farnborough Station, Hants.

COCOA-NUT FIBRE REFUSE.—Useful at all seasons. Largest makers in the Kingdom. 1s. per bag, 30 bags 41 (bags included), truck 25s. free to rail; 5s. van-load, at Works, Janet Street, Millwall, E. P.O.O. payable at General Post Office, London. Orders to be addressed to A. FOULON, Fibre Merchant, 32, St. Mary Axe, London, E.C.

COCOA-NUT FIBRE REFUSE at Reduced Prices, as supplied to Messrs. J. Carter & Co., High Holborn, W.C.; at the International Agricultural Exhibition, Kilburn; and all the Principal Nurserymen and Seedsmen in England:—In 4 bushel bags at 1s., bags included; 30 bags, bags included, 20s.; or truckload of about 250 bushels, 25s. (truckload free on to rail).—J. STEVENS AND CO., Greyhound Yard, and 134, High Street, Battersea, S.W.

COCOA-NUT FIBRE REFUSE, as supplied to the Royal Horticultural Society.—Four-bushel bag (bag included), 1s.; 30 bags (bags included), 20s.; truck free to rail, 25s. T. RICH (late Finlayson & Hector), Cocoa-Nut Fibre Works, 24 and 25, Redman's Row, Mile End Road, London, E.

THE BEST OF THE SEASON.

**SUTTON'S VEGETABLE NOVELTIES.**

FREE BY POST  
(EXCEPT PEAS AND BEANS).

**SUTTON'S IMPROVED WINDSOR BEAN.**

The largest and most productive Broad Bean in cultivation. Very prolific. Price, 1s. 6d. per quart.

**SUTTON'S GIANT WHITE RUNNER BEAN.**

A great improvement on the old White Dutch, and much more prolific than the Scarlet Runner. The pods often reach 12 inches in length. Very hardy, fleshy, and tender. Price, 3s. 6d. per quart.

**SUTTON'S NEW DWARF EXQUISITE GREEN CURLED KALE.**

A new and perfectly distinct variety. Dwarf in habit, and so very compact that each plant appears a mass of elegantly curled and fringed leaves, which are invaluable for garnishing. Price, 1s. per packet, post-free.

**SUTTON'S NEW DWARF EXQUISITE PURPLE CURLED KALE.**

Similar in character to the Green, but the leaves are of a deep brownish-red colour, presenting a most striking effect. A decided novelty. Price, 1s. per packet, post-free.

**SUTTON'S FIRST-CROP CAULIFLOWER.**

Valuable and distinct, the earliest in cultivation. Of dwarf and compact habit, with large pure white heads. Unequalled for forcing and for large establishments.

Price, 2s. 6d. per packet, post-free.

**SUTTON'S IMPROVED TELEGRAPH CUCUMBER.**

Without exception the finest type of Telegraph Cucumber yet offered. Handsome in shape, very small neck, and remarkably prolific. Price, 2s. 6d. per packet, post-free.

**SUTTON'S STANDWELL CABBAGE LETTUCE.**

Stands a very long time before running to seed. Invaluable for summer work. Large size, heart compact and firm.

Price, 1s. 6d. per packet, post-free.

**SUTTON'S GEM CABBAGE LETTUCE.**

One of the best for summer use. Folds in very quickly, and does not readily run to seed.

Price, 2s. 6d. per oz., 6d. and 1s. per pkt., post-free.

**SUTTON'S QUEEN CABBAGE LETTUCE.**

Valuable and distinct; a cross between the Cabbage and Cos, grows to a large size. In addition to a large heart from the centre, the plant produces a quantity of small hearts or tufts. Shows no inclination to run to seed until others have gone by.

Price, 1s. 6d. per packet, post-free.

**SUTTON'S NEW FRINGED CABBAGE LETTUCE.**

Exceedingly useful and ornamental, leaves beautifully fringed. Habit close and compact; fine firm heart.

Price, 1s. 6d. per packet, post-free.

**SUTTON'S BENHAM PARK MELON. (GREEN FLESH.)**

An exceedingly valuable Melon, of which we hold the entire stock. Of oval shape, slightly netted, very thin rind, flesh deliciously melting, and exceedingly good flavour.

Price, 2s. 6d. per packet, post-free.

**SUTTON'S READING ABBEY MELON. (SCARLET FLESH.)**

A new and distinct variety, of which we hold the entire stock. Shape excellent, skin pale green, beautifully netted. Flesh brilliant scarlet, delicious flavour, juicy and melting. Can be grown in an ordinary frame with a cool bottom-heat.

Price, 2s. 6d. per packet, post-free.

**EARLIEST BROWN TENERIFFE ONION.**

Remarkably quick growing, as early as Queen, and of the same excellent mild flavour.

Price, 1s. per packet, post-free.

**SUTTON'S ROYAL CLUSTER TOMATO.**

Novel and distinct. Produces enormous bunches of fruit in clusters, three times larger than Red Currant Tomato. Exceedingly ornamental.

Price, 1s. 6d. per packet, post-free.

**EARLIEST PURPLE-TOP MUNICH TURNIP.**

Stated to be three weeks earlier than any other Turnip. Awarded First-class Certificate by Royal Horticultural Society.

Price, 1s. per packet, post-free.

**Gardeners' Chronicle.**

SATURDAY, JANUARY 24, 1880.

**STREET PEARS.**

THE streets of London are full of interest to the philosopher, the social reformer, the politician, and the moralist. They teem with human life in manifold manifestations: the wealthy and the poor, the happy and the miserable, the good and the bad, jostle against each other and pass their several ways with but little knowledge of each other's circumstances and needs. In the streets of London thousands of persons find a means of livelihood, but of the many modes by which a subsistence is earned that having perhaps the largest amount of interest for horticulturists is the selling of fruit. The quantities of fruit sold in the London streets in a season when it is at all plentiful and can be readily obtained and disposed of at remunerative prices, is perfectly astounding. Were the statistics put into the form of figures and presented in totals their amounts would savour of the incredible. The year 1879 has passed away never to return, with many sins of omission and commission staining its memory, one of these being that its inclement and uncongenial character spoiled the fruit harvest, and left the itinerant street sellers little, if any, to offer. To what other occupation did the hawkers of Pears, for instance, turn their hands when Nature deprived them of the means of a livelihood of this character? Who shall say?

The leading varieties of Pear hawked for sale in the streets of London are the Windsor, Summer Doyenné d'Été, Williams' Bon Chrétien, Hesse, Beurré Bosc, Louise Bonne of Jersey, Beurré de Capiaumont, Beurré d'Amanlis, and Beurré Diel. The model Pear of the Londoner is "Williams." It is a criterion by which he judges of the value of every Pear he is called upon to partake of. In Edinburgh the modern Athenians swear by the Jargonelle; it is their model street Pear, and it is probably not too much to state that if they partake of a good Pear they would pronounce it to be the Jargonelle.

Of the London street Pears but very few fell to the lot of the street hawkers in 1879. The Hesse, which is one of the Pears most largely grown in the London market gardens, was a full crop, and, indeed, the country throughout, in England and Scotland alike. At Chiswick, as also at Newburgh, in Fife, N.B., a great Pear growing district—perhaps the best in Scotland—the fruit were very small and scarcely worth gathering, in fact all over the country very few came to anything like maturity. It will thus be seen that though the Hesse Pear was a good crop, there were yet but very few indeed in the streets. On the other hand, Beurré d'Amanlis was a good Pear this year in the North as well as at Chiswick. It was singularly good in appearance for the season, though wanting in flavour. Louise Bonne of Jersey was conspicuous for its badness: it is a variety largely

grown for market round London, and it is a free cropper, but this season it attained but small size, and the fruit became covered with a kind of fungus, and cracked very much, hardly a fruit attaining to its natural size. Glou Morceau showed a good crop, and though the fruit grew they never attained to full size, and, like Louise Bonne of Jersey, cracked very much indeed; Beurré Diel scarcely ripened at all, though the fruit grew to a fairly good size, and those that matured themselves did not become melting. At Christmas the examples of this variety lying in the fruit-room at Chiswick were as hard as when gathered. Williams' Bon Chrétien, usually a good crop round London, where it is so much grown, was this season but a poor yield and inferior in quality. Beurré de Capiaumont was also very poor and scarcely worth gathering where there was anything like a crop. If one wanted evidence of the lateness of the summer of 1879 it would be found in the fact that the Summer Doyenné d'Été, which in an ordinary season ought to be ripe about July 10, was during the past summer not fit to gather till August 20. Beurré Bosc was inferior in quality this year, and but an indifferent crop.

In regard to some other varieties that may in course of time find their way for sale into the London streets, it may be remarked that Thompson's Pear produced a fairly good crop, and, be it noted, fully up to the average standard of quality. This occurred in several instances numerous enough and sufficiently widely distributed to justify the remark that it proved one of the best flavoured Pears of the year. Aston Town, considered a dessert Pear of the first quality, and in use during the end of October and beginning of November, was this season a heavy crop; it is a variety largely grown by Mr. F. T. Dancer, of Little Sutton, Chiswick, who has a number of large trees that invariably bear fruit of the finest quality. No Pear this season, however, proved better than Beurré d'Ananlis, as it came large in size, though it is not a variety of first-rate quality.

Pitmaston Duchess was singularly fine in 1879, and produced a full crop generally. It is one of the handsomest of Pears, with an extremely rich and juicy flesh, very tender and melting. Jargonelle was a fairly good crop, and fully better flavoured than usual this season. The moist character of the summer might have had something to do with this, for in Scotland the Jargonelle is generally superior in quality to that shown as English grown fruit, especially in the South, the climate being cooler and moister. Marie Louise was very poor in common with others. There was a fair sprinkling of Beurré Rance, but none became melting. Belle Julie, which has the reputation of being a most delicious Pear, becoming ripe about the end of October, was an abundant crop at Chiswick, and also with Mr. Dancer, and of excellent quality. It is a russet-brown Pear, of medium size, and will be much grown by-and-by when it is better known. It should take a leading place as a street Pear. Jersey Gratioli was of very different character last summer.

The fact that early Pears produced a much better crop than late ones is worthy the attention of planters. Much depends on position and soil, but in the long run early varieties can no doubt be relied upon to produce larger average crops than late ones. *R. D.*

THE GREAT YORKSHIRE GALA AND FLORAL FÊTE.—The annual meeting of guarantors and life members was held in York recently, Mr. Alderman Terry in the chair. The sum of £500 was voted for prizes in the floral department for the exhibition in June next, and £150 for music, and £310 for other attractions. This will be the twenty-second exhibition of the Society, and the *esprit de corps* animating the committee will ensure, as it always has, the full confidence of the exhibitors and the public.

## New Garden Plants.

ONCIDIUM XANTHOCENTRON, *n. sp.\**

This is a new member of the group represented by *Oncidium pyramidale*, Lindl., most probably regarded as a variety of this by the late Professor Jameson. It is nearest *Oncidium elephantotis*, but the cheeks of the tabula of the column are square and very prominent, the wings of the column are semi-ovate, blunt, bilobed (hence emarginate), the crest is distinct and entire, the lip is of a dark colour with a nearly rhomboid yellow centre. The petals are hastate at the base, shortly stalked and provided with a dark spot over the base. The inflorescence is an exceedingly dense panicle. If the dark colour of the lip is elegant, the contrast of colours is also very marked, and the plant supplies an almost novel effect. It is one of the recent South American discoveries of Mr. F. C. Lehmann, the energetic and successful traveller. *H. G. Rehb. f.*

THRIPSERMUM MOOREI, *n. sp.†*

This plant, which may bear the name of *Sarcophilus Moorei* in gardens, came from the Royal Exotic Nursery of Messrs. Veitch, who had it from Mr. Charles Moore, the very successful director of the Sydney Botanic Gardens. It came from the island of New Britain, of the group of Solomon Islands. The novelty is inscribed to our excellent colleague, with the expression of the friendly hope that we may soon have once more a fresh opportunity of seeing him in Europe, where a hearty reception always awaits him. The leaves exceed 2 inches in breadth, and are nearly a foot long, which gives them an unusually broad appearance. Their substance may be called coriaceous-chartaceous. They may be bilobed at apex, but I have not that part in integrity. The peduncle is half the length of leaf. It is of a brownish-purple colour, and its superior part bears a cylindrical, lax, many-flowered raceme. The flowers are equal to those of *Thripspermum lunatum*. Sepals and tepals light ochraceous yellow, with numerous elegant brown blotches. Side lacinia of short, small, sacciform lip strong falcate, middle lacinia very much shorter, retuse, with two marginal increscent parts, and two very small and very short conical horns inside, and a hippocrepic area of hairy papillæ under the nail of the lip in the short blunt conical pouch. The pollinia are dark yellow and very waxy. *H. G. Rehb. f.*

LELIA ANCEPS (Lindl.) ROSEA, *nov. var.*

Once more a new variety of *Lelia anceps*, having bright rose-coloured flowers, but the margins of the lip's lacinia are darker, though not so dark by far as is the genuine variety. Even the dark lines on the yellow disk of the lip are not so dark as in the common variety. I obtained this very curious and pretty novelty from Mr. Day, who found it in Mr. Bull's establishment. *H. G. Rehb. f.*

MACRADENIA BRASSAVOLE, *Rehb. f.*

This is a curious species. A single inflorescence, seen in a herbarium without bulb and leaf might be thought to belong to some *Epidendrum* in the way of flamineum, carneum, or bivalve. The pseudobulbs are ligulate compressed, not much exceeding 1 inch in length and  $\frac{1}{2}$  inch broad. One or two cuneate oblong-ligulate acute leaves, reaching 5 inches in length, and  $\frac{1}{2}$  inch in breadth. A nodding peduncle bears numerous dense flowers, which have all six organs long acuminate, exceeding  $\frac{1}{2}$  inch in length; sepals and petals cinnamon with ochre-coloured margins. The trifold lip has rhomboid side lacinia and a very long cuspidate middle lacinia. It is white, with purple streaks with yellow borders to the side lacinia. The staminodes are yellow with red borders, and the long beaked rostellum has purple borders. This species is distinct from *Macradenia triandra* by its aristate sepals and petals and lip, not to speak of the lip's other discrepancies. It was discovered I believe in 1850 or 1851 by the late M. Warszewicz in Guatemala, and described by me in 1852. Then it appeared, I think, in 1864, in M. Linden's garden, having been sent from New Granada by the late Wallis; finally quite recently I had the success of obtaining a nice living plant with its lovely nodding raceme from Messrs. Veitch. It had

\* *Oncidium xanthocentron*, *n. sp.*—Affine *Oncidium pyramidale*, Lindl.; inflorescentia densissima ditissima; sepalis ligulatis obtusis, tepalis unguiculatis hastato oblongo-ligulatis obtusis; labello pandurato, basi latiori, lobis posticis retrorsis obtusangulis, callo quinque-dentato, dentibus lateralibus biserialibus, in angulo inter utrumque unidentatis, alis columnæ oblongis emarginatis (hinc panduratis); tabula infrastigmatica inferne quadrata producta.—In Andib. det. cl. F. C. Lehmann.

† *Thripspermum Moorei*, *n. sp.*—Folius loratis latis oblongo ligulatis apice—pedunculo dimidium folium æquante parte superiori racemoso; bracteis triangulis minutissimis; sepalis tepalisque oblongis obtusissimis acutiusculis sub obtusis unguiculatis; labello unguiculato reniformi conico, lacinia lateralibus porrectis semi-lunato falcatis magnis, lacinia mediana recto emarginata minutissima, corniculis conicis geminis infrorsis appositis, linea hippocrepica velutino papillosa sub columna in sacro, rostellato bidentato; pollinibus ceres densissimis. Sepala et tepala ochraceo-flava elegantissime atropurpureo gutturalia. Labello maculis strisque atropurpureis et aurantiacis. Columna flava maculis brunneis pallidis.—New Britain nis, cl. Ch. Moore ad cel. merc. Veitch. *H. G. Rehb. f.*

been sent them by Mr. Charles Winn, Birmingham, who obtained the plant at one of Stevens' sale meetings amidst *Oncidium Kramerianum*. Many thanks for the good specimen. *H. G. Rehb. f.*

## PACKING GRAPES FOR MARKET.

IN our last volume, p. 624, we gave some particulars of the system of packing Grapes for market so successfully practised by Mr. Coleman, of Easton Castle Gardens, which we now supplement with an illustration (fig. 20) of one of his boxes as packed, prepared from a photograph placed at our service by Mr. Webber. The woodcut represents a box of the size recommended by Mr. Coleman, viz., 24 inches long, 14 inches wide, and 6 inches deep, inside measure, and made of  $\frac{1}{2}$ -inch deal, with the lid all in one piece. We need not now repeat the details of Mr. Coleman's method, but for the convenience of those who may desire to refer to them we add the reference, viz., p. 624 of our number for November 15 last.

## ART IN THE CONSERVATORY AND GREENHOUSE.\*

THE subject under the title of "Art in the Conservatory and Greenhouse" is a very wide one, and the limited time, both at your disposal and mine, will render anything like an exhaustive paper quite out of the question. A few leading details, from a constructive and architectural point of view, is all that I can pretend now to contribute for your discussion.

The great advantages of conservatories and glass-houses of all kinds, both in immediate connection with dwelling-houses and as detached buildings in garden grounds, are, of course, beyond dispute, while all intelligent minds can but find delight in the cultivation of flowers and fruit, even if circumstances will but allow of such a pastime being conducted only in a very limited degree.

Nothing can add to the grace and comfort of a house so much as natural flowers. Decorators and furnishers, whether they belong to the classic, the mediæval, the Queen Anne, the French, modern, or any schools, will never make the comforts of a well-appointed dwelling in any sense complete without some judicious use of flowers in their living state. The charm of a cottage, more than often, is to be found in its window flowers, while the not very hospitable arrangements of an almshouse home are rendered enviable by the charmingly bright flower-beds which are nearly always found in connection with such dwellings.

Simple and trite as such commonplace remarks are, they refer to facts which really lie at the root of the matter; for if there be one question of domestic economy, so to speak, occupying the attention of ordinarily cultivated people at the present time more than another, it is, in hackneyed phrase, "art at home." How to make one's home in some sense artistic? In the days of the Gothic Revival, as it is called, almost every effort was concentrated on the artistic building and furnishing of churches; and so generally has this feeling extended itself that Nonconformists of every shade have long since become by no means behindhand in imitating the High School of the Church of England, which may claim to have originated the movement in ecclesiastical matters. For all this enthusiasm architects can but be very thankful—this desire on the part of the public for a more artistic and appropriate treatment of things. Of course much of it is no deeper than mere fashion, still use seldom fails to prove itself a second nature; and already the honest seeking for art at home has established itself as a fact. Furniture manufacturers, paper-hangers, and even drapers, have had discernment sufficient to notice this; and further it may be remarked that in several very important instances much that should have fallen into the hands of architects to design has been executed by trading firms such as these, while some tradesmen have gone so far as to charge and obtain professional fees as decorative artists. The architectural profession has failed to secure much of the work alluded to, chiefly because it shrank somewhat from the opportunity thus presented; and it has been much the same with horticultural buildings, which either have been treated as

\* A paper read before the Leeds Architectural Association, by Mr. Maurice B. Adams, A.R.I.B.A., on Thursday, January 15, 1880.

of very secondary importance, or relegated to the carpenter and builder to design.

Why should anything do for a conservatory? Often, and more than often, one sees adjoining a pretentious and evidently costly house a mere glazed shed of the ugliest proportions, evidently the production of some house-carpenter, or mere greenhouse builder; and occasionally when an attempt has been made by the architect to render the conservatory in keeping with the architectural character of the house, it is to be feared that almost all the requirements of a building for plant growing have been overlooked, the chief and only thought being to make the structure architectural.

In the days when Gothic was thought to be the only style for every kind of building, some of the most singular things conceivable were built in the way of conservatories. All the glories of the stop chamfer were intensified; and heavily-braced framing, which was quite out of place, with diagonal jointed boarding *ad lib.*—in short, all the incongruous mouldings and shapings of the residence itself—were brought to bear in the glasshouse adjoining. And if one looks back to earlier days, when classic archi-

ture alone and in conjunction with Mr. E. W. Godwin, F.S.A. These designs must be taken simply for what they are worth, and judged according to their merits; but probably they will illustrate my ideas better than a written description alone of what one has carried out. At the conclusion of my paper I will briefly allude to some of the drawings in particular. It may, however, be here remarked that nearly all the exhibited designs are in either "the Adams'" style, or, perhaps, rather in what has been called "Queen Anne;" and it is in this respect of style, I fancy, that we have a considerable advantage over those who worked either in the classic or Gothic manners. Neither classic nor Gothic forms are, *per se*, suited for the interior finishings of ordinary domestic dwellings now, and most people will, I think, agree that the latter styles just referred to are eminently adapted for our modern requirements. Mr. E. W. Godwin has very cleverly introduced an adaptation, which he calls Anglo-Japanese, for one or two conservatory designs, and these will commend themselves to you. There is this to be said, however, about styles: that although the "Free Classic," to use an appropriate term, lends itself to the hori-

whatever kind must, above all things, be a practical building, and there is no reason why it should not be made in an equal degree a thoroughly artistic one, even where limited outlay governs the proceeding, provided, of course, a reasonable amount is to be expended.

REQUIREMENTS TO BE MET.

With these preliminary remarks we may turn to the practical requirements of the class of structures under notice, in all of which light and heating requirements, with a ready means of ventilation, are among the chief considerations to be observed. The working houses in a garden—that is, the houses which are exclusively devoted to the growing of plants and fruit, are rather numerous. They comprise the plant-house, intermediate-house, stove, forcing-houses, propagating houses, Orchid-house, vineries, Peach-house, or orchard-house, Pine-pits, Melon and Cucumber houses, &c. In large establishments we frequently find houses devoted to one particular flower, as Orchid-houses, Camellia-houses, Azalea-houses, Palm-houses, Rose-houses, &c. Vineries have also to be so arranged that ripe Grapes may be

FIG. 20.—MR. COLEMAN'S METHOD OF PACKING GRAPEs FOR MARKET. (SEE P. 104.)

ecture was thought more suitable, it will usually be found that conservatories were constructed in such a heavy style, and of such lofty proportions, that it was almost impossible for any gardener to grow either flowers or fruit with success in them. But surely at the present time there can be no excuse, seeing that eclecticism rules with absolute sway in everything, especially in art. I do not say that such a rule is a good one, far from it; but it is evident that no trammels of any architectural school need prevent conservatories and horticultural buildings from being treated in a common-sense and really artistic manner, whether they belong simply to the limited form of a window Fern-box and glasshouse of a town dwelling flat, or the more extended character of conservatory proper and winter garden.

The regular nurseryman's glass buildings also might with advantage, and without much extra cost, be made more picturesque; and the thought is worth consideration, even from a money-making point of view, seeing that his stock would show to better advantage, though it is to be feared that a long time will elapse before many are led to take this view of the matter.

On the walls are exhibited a series of more than thirty designs of buildings, embracing most forms of garden architecture, which I have prepared for execu-

zontal lines and square openings of our modern houses, it really matters but very little what style a thoroughly competent architect determines to work in, though of course he will succeed best in the style with which he is most familiar, but under most circumstances a true artist is able to produce a suitable design, with thought and study, in any style; and he often, out of the most elementary materials, succeeds in giving his client a well-proportioned and inexpensive building, devoid at once of bad taste as well as the commonplace. On the other hand, an indifferent architect or designer will fail in producing anything good, be the style or outlay what it may, and the chief cause of failure is generally to be found in the fact that too great an attempt is made. And if this be true in house and church building, where the precedent is frequently followed, how much more must one expect it to be the case in horticultural buildings, in which the most simple forms are needed, and where all pretence should carefully be avoided.

Any architectural design worthy of being classed as a work of art should first of all be simply the outcome of the purposes for which the structure is intended, and it must always be folly on the part of the architect if he attempt to persuade himself or his client that a building is in good taste when it fails to fulfil the objects for which it was built. A conservatory of

had all the year through. In order to do this, special attention has to be paid to heating, so as to ensure whatever temperature may be required, no matter what may be the temperature out-of-doors. It is also of equal importance, as I have just said, that a thorough ventilation should be obtainable at any time, and without special attention to these points in particular no house can be considered a success. To briefly notice the various houses already enumerated may not here be out of place, giving at the same time a few details, most of which will be of service to an architect who may have to build glasshouses for general purposes of any kind, such as those in connection with houses especially requiring a more ornamental treatment than the special buildings now referred to.

PLANT-HOUSES.

We will take the plant-house first. This is frequently made a span-roofed structure, and 18 feet wide is found to be a width which will admit of the most advantageous arrangements of fittings. It is usual to place a flat stage on either side and a stepped one in the centre, thus leaving a walk all round the house. The pipes for heating can be conveniently arranged under the side stages. A span-roof is the best form that can be erected, as the plants, having light all round them, are not so liable to be drawn to

one side or the other, and thus become of bad shape, as they are likely to be in lean-to houses. A span-roof house should be placed with the ends north and south, as by this means each side secures an equal amount of sun. The length from end to end may vary according to circumstances, but it is generally advisable not to have one house more than 40 or 50 feet long, as by dividing it up and heating each house separately, the gardener is afforded greater facilities for growing his plants. The heating apparatus can easily be regulated in connection with one furnace, as at Kew, where one big boiler heats three or more houses.

The HALF-SPAN house is the next best, and is very frequently used where a back wall exists. The light is not so well distributed as in a span, but the house has a great advantage over the lean-to house for plants. Internally, the most convenient arrangement will be to have a flat stage in the front and a stepped stage at the back. I may here say that if no other provision be made for obtaining water, warmed in proportion to the temperature of the house in which it is to be used for watering the plants, a tank or cistern should be arranged in the floor of the structure for this purpose, a trough under the passage-way is a good method.

A "LEAN-TO" would be fitted in the same way. Both half-span and lean-to buildings should run east to west, facing the south, and rather inclining towards the east. In this country the angle of 45° is, for most purposes, found the best pitch for horticultural buildings generally.

For plant-houses 1 foot of 4-inch pipe for every 28 or 30 cubic feet of air will be found to give a proper temperature.

The INTERMEDIATE house is used for growing plants that require a somewhat higher temperature than the plant-house, but not so high as the stove. One foot of 4-inch pipe to about 25 cubic feet of air will answer best in this case, and in other respects the building resembles the plant-house.

#### THE STOVE.

The stove-house is more usually made with iron stages carrying slate shelves covered with stone-chippings, sand, or small shells, on which the pots stand, thus obtaining a soaking for the superfluous moisture after watering; and from an artistic point of view, this system of gravelling the shelves with small shells is much to be recommended, especially in ornamental houses, where the ground space should be laid out, as far as possible, in natural beds instead of devoting the room entirely to stages. If wooden stages were employed in stoves similar to those employed in the plant-house, where they are made of stout laths 1½ inch by 1 inch, about ½ inch apart, it would be found that, owing to the great heat kept up and the quantity of moisture usually produced, they would be liable to speedy decay. The stove may be either a span, half-span, or lean-to structure. Each form has its advantages, though, all things considered, the span-roof is the best. This house is heated in the proportion of 1 foot of 4-inch pipe to about every twenty cubic feet of air, and the same system applies to the Orchid-house. These proportions must, of course, be taken as a medium guide, for it is evident that the quantity of pipe necessary to keep up a given temperature will vary according to different situations and local influences; thus houses in the North of England and Scotland will require more pipe than those in the South of England. Also a span-roof, because it has a much greater cooling surface, will require more pipe than a half-span or lean-to where the back consists of a brick wall; but the proportions of heating power which I have just given will be found sufficiently accurate for a basis.

#### HEATING.

At the risk of being tedious, permit me to say a few words more with reference to the subject of heating, because the particulars may be of value for future reference, when a more strictly accurate rule than the above calculations is required. It has been found from careful experiments that one square foot of glass will cool 1¼ cubic feet of air per minute, as many degrees as the difference between the external and internal temperature. Therefore, having taken out the number of square feet of glass, multiply this by 1¼, which will give the number of cubic feet of air to be warmed per minute. Then proceed by the following rule:—Multiply 125 by the difference between the extreme external and internal temperature, and divide

the product betwixt the temperature of the building and the pipes (the latter being usually calculated as at 200°); this quotient being again multiplied by the number of cubic feet necessary to be warmed per minute, and divided by 222, will give the number of 4-inch pipe which will be required to bring the building to a proposed temperature. Suppose it be required, for example, to ascertain the quantity of pipe to heat a vinery with 400 square feet of glass to 75°, and, estimating the lowest external temperature at 20°, the calculation will be as follows:—125 × 55 (difference of external and internal temperature) = 6875 ÷ 125 (difference between temperatures of pipes and house) = 55, which multiply by 500 (number of feet of air to be warmed per minute) = 27,500 ÷ 222 = 123¾, the number of feet of 4-inch piping necessary.

(To be continued.)

#### DATE PLUMS.

WHEN in Singapore a little more than a year ago I caught sight of a bronzy skinned Celestial trudging along, with what appeared to be two splendid baskets of Trophy Tomatos—a closer examination, however, proved them to be ripe fruits of Diospyros. My constant practice when abroad was to learn the Malay name of every fruit and beautiful plant I saw, and the reply to my question in this case as to the name of the fruit was "Pisang Kaki." Now "Pisang" is the Malay name for the Banana, and on my saying as much to the itinerant dealer in Persimmons his reply was "Tuan etu, Betal; cinc boah line matcham, cinc boah Kaki, Hongkong punya"—which meaneth, "That is quite true, sir; but these fruits are of another kind—Kaki fruits from Hongkong!" The Celestial well loveth to sit upon the outer barbarian, and in this case his pleased grin told me of his inward chuckling at my ignorance. The fruits were very fresh and fine, of a Tomato-like red colour, covered with a delicate bloom. I purchased half a dozen of the finest specimens for a few cents, and made a careful study of them. They were perfectly ripe, and showed no signs of being bletted, although I was afterwards told that they were gathered before perfectly ripe, and then packed in boxes of fine clean sawdust for transit. That they had been most carefully packed and handled their freshness and delicate bloom showed very plainly. I afterwards found out that these and other Chinese fruits are brought down to Singapore every season, and are as much appreciated by the Chinese inhabitants as the Apples of Australia are relished by Europeans, even although the choicest of tropical fruits, such as Mangosteen, Bananas, Mangoes, &c., may be had at a tithe of their cost.

I did not detect any evidence of the sutures or ribs so evident in *D. Kaki* var. *costata*, as figured in the *Revue Horticole* for July 16, 1871, in the first fruits I saw—all the batch being perfectly plump and smooth, and of an ovoid form, as shown in my sketch. Some fruits were perfectly seedless—others, again, had from five to eight seeds, similar in size and shape to those of Scarlet Runner Beans, but flatter, and of an uniform dark brown colour. The pulp surrounding the seeds was Apricot-like, having however a trifle more juice, and there was a rich sugary after-taste followed by a slight astringency. The puckery or astringent after-taste was most apparent in the case of the fruits which contained seeds. Like the good boy in the fairy tale, I saved the seeds of the fruit I ate, and they germinated in the garden here about three months ago. They came up very quickly, about a fortnight after they were sown. Their mode of germinating is interesting.

I think it was the late Thomas Rivers who said that the public generally required very clear and distinct directions as to the planting of fruit trees. The great fact, as he remarked, was to point out clearly that the root end of the trees was to be placed downwards! Perhaps I did not sufficiently observe this advice, and so planted my Diospyros seeds wrong way upwards, at any rate the radicle, after forcing its way out of the testa, curved over like a shepherd's crook and commenced its downward course. At this stage the seeds and radicle were entirely covered with soil, but the downward growth and pressure of the radicle pushed up the crooked neck above the soil, and eventually the plumule is, and apparently by this action of the radical, drawn or pushed out of the testa. I observed that the radicles after pushing downwards about an inch, took a sudden bend or deflection, and I thought at the time this might be to obtain a fulcrum

from which their full growth-pressure might be brought to bear in pushing the curved neck upwards, and so drawing the plumule and cotyledons from their imprisonment in the testa or seed-coat.

It will be seen that the above account does not altogether coincide with that of M. Naudin\* inasmuch as the fruits are called "Kaki" by the Chinese themselves, as I afterwards found out from an educated Chinese gentleman and an enthusiastic amateur gardener to boot, in Singapore. Then in the first specimens I saw and sketched there were no indications of furrows or ribs, and there were both abortive and perfect fruits so far as good seeds are concerned. I am well aware that it is only by comparing the wild types of Diospyros that any lines of demarcation of value are to be found. The question I would venture to propose, however, is, are there really two wild types of Diospyros, the one a native of China and Mongolia, the other confined to Japan?† I saw at least a dozen varieties after my sketch was made in Singapore, some with ribs and sutures, and of all tints—green, yellow, orange, and others deep sub-translucent crimson, like the fruits of *Solanum Dulcamara* when perfectly ripe, and of various sizes. Some were like *D. Mazeli* (of *Rev. Hort.* 1874, p. 70), others like *D. Kaki* var. *costata*, whilst some recalled the glimpse and memory of Mr. G. F. Wilson's variety, fruits of which I saw and tasted at South Kensington a year or so before.

I am afraid that size or shape or the fertility or otherwise of such long domesticated fruits as the Diospyros are not sufficient as data on which to found any distinctions of specific importance, especially as it is now known that both Chinese and Japanese gardeners are such adepts in raising and selecting seedlings of this popular fruit, the finer kinds of which are as carefully grafted as our finest Apples or Pears at home. Whether any of the cultivated varieties will ever prove sufficiently amenable to Orchard-house culture in England so as to make them popular, is a question that time and trial alone can settle. Of the distinctive beauty of the fruit there is no question, and as grown and ripened in China it is certainly equal to a fairly good Apricot, which is no mean praise. Some of the varieties are being tested by Californian fruit-growers, and the dried fruits from Japan may soon be expected in our shops, although the *Rural New Yorker's* estimate of them—"they remind us in flavour both of the Fig and the Date, although they are inferior to either,"—is not very high praise! Still a new addition to dessert or dried fruits affords variety, and in large cities incredible sums are yearly spent in novelties of this class. It is a sort of speculation which is nearly akin to gambling and the love of travel, a Micawberish state of mind, anxious to see what will "turn up" next? *F. W. Burbidge, College Botanic Garden, Dublin.*

MANCHESTER BOTANICAL AND HORTICULTURAL SOCIETY.—At the annual meeting of this Society, held on Monday last, the President, the Earl of Derby, in the chair, the report of the Council, which we published last week, was adopted. In seconding the motion for its adoption, Dr. Watts stated, with reference to the Society's garden at Old Trafford, that their long range of glasshouses, which were erected fifty-two years ago, were giving way as regarded the framing rapidly, and they must contemplate a considerable outlay for their renewal. The Secretary (Mr. Findlay) had a plan by which he proposed to make the long range semicircular, starting from the first exhibition-house and running back, over land which was now, at any rate to a great many of the proprietors, *terra incognita*, and by which means greater space would be afforded, especially for promenading. He need not say that that would be a very costly operation, and they would need all the help they could possibly get to carry it out. On the motion of Dr. Watts, seconded by Mr. Samuel Barlow, it was also resolved—"That the Council be at liberty to issue sixpenny admission tickets, to be distributed by the proprietors and subscribers, admitting at any time, except on exhibition and promenade days."

\* See *Gardeners' Chronicle*, 1880, n. s., xiii., 15.

† The species and varieties alluded to by M. Naudin are thus set down by M. Lavallée in his *Arbor. Segrezianum*, p. 164.—

SELECT INDEX OF PLANTS FROM 1841 TO 1878.—(Continued from p. 43.)

**GEONOMA**—  
*gracilis*, 419, ii., '74  
*lacerata*, 1278, '69  
*Martiana* var. *Seemanni*, 419, ii., '74  
*princeps*, 11, ix., '78  
*Schottiana*, 649, '73  
*Seemanni*, 1278, '69  
*Wendlandi*, 449, ix., '78

**GERANIUM**—  
 (see *Pelargonium*)  
*Backhousianum*, 419, ii., '74  
*erianthum*, 436, '41; 623, '42  
*ornithopodum*, 646, '73  
*rubifolium*, 87, '41

**GERARDIA**—  
*flava*, 831, '44  
*pedicularia*, 42, '72 (fig.); 720, x., '78  
*quercifolia*, 831, '44; 42, '72 (fig.)

**GERRARDANTHUS**—  
*portentosus*, 164, '69

**GESNERA**—  
 (see *Dicræa*: *Corytholoma*: *Reichsteineria*)  
*breviflora*, 271, '48  
*discolor*, 415, 799, '41  
*lateritia*, 396, '41  
*libanensis*, 405, '48  
*longifolia*, 511, '42  
*pardina*, 39, '48  
*Schiedeana*, 259, '45  
*Suttoni*, 423, '42  
*triflora*, 7, '48  
*zebrina*, 23, '42

**GILIA**—  
 (see *Fenzlia*: *Ipomopsis*: *Leptodactylon*: *Leptosiphon*)  
*achilleaeifolia*, 649, '73  
*Brandegii*, 786, x., '78  
*liniflora*, 394, '72  
*micrantha*, 201, '71 (fig.)  
 — *rosacea*, 646, '73  
*pharnaceoides*, 23, '48  
*setosissima*, 492, iii., '75  
*tricolor*, 133, '45

**GLADIOLUS**—  
*eruentus*, Moore, 1138, '68; 105, '70  
*dracoecephalus*, 646, '73  
*Eckloni*, 778, viii., '77  
*gandavensis*, 231, '44  
*purpureo-auratus*, 046, '73; 419, ii., '74  
*Saundersii*, 646, '73  
*splendens*, 559, '43  
 disease, 420, vi., '76 (fig.)  
 florists', properties of, 381, '61

**GLAUCIUM**—  
*leptopodium*, 728, ix., '78  
*Serpieri*, 419, ii., '74

**GLEDITSCHIA**—  
*macrantha*, 470, x., '78  
*sinensis*, 470, x., '78

**GLEICHENIA**—  
*rupestris*, 405, iii., '75 (fig.)  
 species of, 909, '62

**GLOCHIDION**—  
 a new, 838, '45 (fig.)

**GLONERIA**—  
*jasminiflora*, 646, '73  
 (= *Psychotria*)

**GLOSSOCOMIA**—  
*ovata*, 56, '42; 468, '56 (fig.)

**GLOXINIA**—  
 (see *Ligeria*: *Sinningia*: *Stenogastera*)  
*digitaliflora*, 759, '43  
*hypocytiflora*, 1142, '67  
*miculata*, 738, x., '78 (fig.)  
*speciosa*, 27, '42; 591, '44  
 — var. *Menziesii*, 352, '42  
*tubiflora*, 743, '42  
*violacea*, 299 (for 399), '41

**GMELINIA**—  
*Rheedii*, 639, '43

**GNAURS**—  
 756, '55

**GOBBO**—  
 231, '41

**GODETIA**—  
 (see *Cenothera*)  
*albescens*, 223, '42  
*grandiflora*, 759, '42  
*Lindleyana*, 133, '45  
*Nivertiana*, 649, '73  
*rubicunda*, 133, '45  
*tennifolia*, 133, '45

## KUBANKA AND SAXONKA WHEAT.

IN the *Gardeners' Chronicle*, vol. xi., p. 652 (May 24, 1879), appeared an account of my first year's experiments with Kubanka and Saxonka Wheat. It will there be seen that specimens of these two varieties in ear had been furnished from Samara, in Russia, by request of Dr. Asher to Dr. Charles Darwin, for the purpose of testing the opinion that Kubanka grown repeatedly on inferior soils assumed the form of Saxonka. The specimens were put into my hands for experiment.

I continued my experiments in 1879 with my own seeds of the previous crop. I had planted rows of these Wheats in the garden on October 24, 1878, but although some of the seeds germinated, none of the plants survived the severe winter.

The snow lay so long in the spring of 1879 that it was not till March 31 that seeds could be planted. At this date a row of Kubanka and a row of Saxonka were put in alongside of each other in the garden, of the best seeds of crop 1878. The Saxonka plants became much stronger than the Kubanka, and produced three or four times as many tillers, but owing to the extreme wetness and slowness of the season no flowering took place till so long after the usual period that it was then evident there would be no fruit, and that the experiment would be of less value for its intended purpose than had been expected. The plants were also attacked by red-rust. But although fruit was not here produced, the fact was shown by these two rows that no change had taken place in the character of the respective ears; the Kubanka remained a thickset ear, however much dwarfed in size, and the Saxonka remained an ear closely resembling, or identical with, "Fern" or awny spring Wheat.

Beside these rows a little plot was sown on April 2 with a mixture of 106 seeds of each of the Wheats, broadcast. The resulting plants were so poor and diseased, carrying no fruit whatever, that it was useless to attempt any estimate of the quantity of any part of them. It was noticeable, however, that the unfavourable conditions which had killed many of the seeds and stunted the whole crop had not converted all the plants into the Saxonka form. There were more Saxonka plants than Kubanka, but there were fewer of each than 106.

On April 16 I mixed 350 troy grains of the Saxonka which had grown amongst Oats the previous year and was not rusted, with nearly the same weight of unrusted Kubanka and as much more partly rusted as made the Kubanka double the weight of the Saxonka, or 700 troy grains, and sowed the whole broadcast in a corner of a field ploughed out of grass.

As in the former cases the pollination came far too late to admit of general ripening. The Saxonka here also showed the highest vitality, for although a double weight of Kubanka had been sown, the number of Saxonka plants greatly exceeded the number of Kubanka. When cut in the beginning of November, and separated from each other, the Saxonka plants weighed nearly two-and-three-quarter times as much as those of the Kubanka. Some of the Kubanka plants were better than any of the Saxonka, reaching a length of nearly 5 feet, carrying ears 3½ inches long, having ten ranks of spikelets on each side, some of which showed four fertile florets or grains, and giving sixty and seventy grains to the ear; the best grains weighing about half a grain troy.

The best plants of Saxonka were 4½ feet in height, with ears of eight ranks of spikelets, each for the most part carrying three grains, and each grain averaging in weight about ¼ of a troy grain.

In both varieties of this plot the seeds are sufficiently matured, though the latest sown, to be available for the production of another crop; but in the Saxonka the process of ripening is the most advanced, arising from the fact that the Saxonka is more of what is called a spring or summer Wheat than the Kubanka. All Wheats are able, in various climates, more or less to accommodate themselves to autumn or spring sowing; but in some sorts the process of assimilation is naturally more rapid than in others, and hence the classification into winter and summer Wheats. That such a classification exists may help to point out that the trimestrian Wheats, probably of the old Roman farmers, have not been evolved in recent times. But although Wheats have been loosely classed as summer and winter some are

equally adapted for autumn and spring sowing; and the separation of so-called species is really made, not in reference to the time of seeding, but in reference to the character of the spike. Whether a persistent sowing of a spring Wheat in autumn has ever changed its physiological aptitudes is very doubtful; certain it is that no such treatment has demanded a new description of the spike.

Now, what are the conclusions to be drawn from the present experiments? Where the two rows of different seeds were sown separately and produced plants like the plants from which they had been derived, the inference is inevitable that no transmutation had taken place. Where two of Kubanka to one of Saxonka were sown as a mixed crop, producing eleven of Saxonka to four of Kubanka, uncorrected imagination might conclude that many of the Kubanka seeds had produced Saxonka plants. But we know as a fact of the case that if the Kubanka seeds had been equally vital with the Saxonka, there should have been about double the number of Kubanka plants which there were of Saxonka; in reality there were less than half as many. And if in this experiment a certain number of Kubanka seeds produced Kubanka plants, while in another experiment all the Kubanka seeds which grew were certainly known to have produced Kubanka plants, it is more probable that the Kubanka seeds which did not produce Kubanka plants died, than that they produced Saxonka plants. So far as the logical elements of the case go, it is not absolutely certain in the case of the mixed sowings that some of the Kubanka seeds did not produce Saxonka plants, or some of the Saxonka seeds Kubanka plants; but it is certain that there were more of Saxonka seeds sown than there were of Saxonka plants reaped, so that no transformation was needed to produce any one of the Saxonka plants; and thus certainly the best conclusion is, that the predominance of Saxonka has here arisen, not from transmutation of Kubanka, but from the higher or more immediate vitality and fertility naturally inherent in the cells and protoplasm of the Saxonka embryo, under the circumstances.

Dr. Asher, who is well acquainted with the phenomena here in question, and would only have proposed them for solution for good reasons, in some observations he has done me the honour of making on my first year's experiments, objects that "Kubanka Wheat, far from being less prolific than Saxonka, is, on the contrary, the most prolific of all known kinds of Wheat; eight ears from one grain, and forty grains to each ear not being very rare in favourable years on the proper soil." I have no doubt that these facts are strictly correct, some of my own Kubanka plants giving a similar return. Kubanka Wheat can hardly be distinguished from the old Pole Kivet Wheat of England.\* Many ears of this variety grown by me show from 80 to 100 grains, the plants carrying from six to twelve ears. But this is as nothing to the potential fecundity of a seed of almost any variety of Wheat. Planted at the proper depth, on the proper soil, in a favourable year for tillering, a seed of Wheat will give 3000 or 4000 returns. But the present contention is, that the inferior or half-exhausted soils in Russia or elsewhere are not able to develop so high a fecundity in Kubanka Wheat as in Saxonka, which makes less demand upon physiological agencies. For centuries of the worst Scottish agriculture, much of the soil was unable to produce anything but the "small Oat" (*Avena strigosa*); and there was just the same reason probably for supposing that the "great Oat" (all forms of *Avena sativa*) had then changed into the small Oat, as there is for supposing that Kubanka Wheat changes into Saxonka.

Dr. Asher makes various other objections to my hypothesis for the intrusion and predominance of Saxonka. He informs me that the appearances in question were observed by him on the land of Count Orloff-Davidoff, one of the most prominent agriculturists among the landed proprietors of Russia; that the field he saw was quite a mixture of Saxonka and Kubanka, although the intention of the superior tenant, a highly intelligent and industrious German, certainly was to produce only Kubanka, and everything had been done to attain that aim; that some

\* *Larson's Manual* does not mention this Wheat by the name of Kubanka; but perhaps it is what is there called "Turkey Wheat," and by the French "Blé gros Turquet," "Polard rouge bleu"; "Gros ble rouge," &c., and may be what Tusser calls "Turkey or Purkey Wheat," which he says "many do love because it is floury." The great number of names which every form of Wheat has had from the time of Theophrastus utterly confuses inquiries like the present.

of the more intelligent Russian landowners, in order to prevent the degeneration of Kubanka, choose after the harvest the finest ears one by one, employing their most careful people for that task, and as the aspect of Kubanka and Saxonka ears differs very widely, errors on any extensive scale are quite out of the question, and yet these agriculturists are obliged to renew their seed at least every five or six years by purchasing from the finest virgin steppe land; and further, that the grain which in St. Petersburg and London is called Saxonka, is in Samara called "Peresod," signifying degenerate. The very name of Saxonka, it is added, is an important fact, since it appears from a careful study of the history of the German colonies in Russia that at the time this word was first used these people could not possibly have developed any European Wheat; Saxonka certainly being the development of a Russian grain which the German colonists found useful.

To the claims of transmutation, as thus stated, I have given a careful consideration. But I cannot concede that the Russian agriculturist is any better able to perpetuate an unmixed stock of any Wheat or other corn than the Scotch agriculturist; and no field of Scotch grain is other than a more or less mixed crop of various kinds. No care on the part of the farmer can prevent the shedding of grain by gales before harvest; and where, as in some parts of Russia, this shedding is all the seed of the following crop, the problem becomes too complex for observation to follow. The selection of Kubanka ears referred to, even were it carried the length of forming sufficient stocks to sow whole fields, has always to be weighted with the carelessness and inattention of servants. This hopeless method of improving seed corn is recommended by Columella, who tells us it was also approved of by Celsus (B. ii., ch. ix.). The former tells us likewise that "all common Wheat after the third sowing on wet ground changes into Siligo." And Henry Best, in his *Rural Economy of Yorkshire* (1641) informs us that among the "long read" Wheat "oftentimes" came up "a Wheate called driven Wheate having noe awnes," which hindered the sale of the main crop; showing the same facts as have given rise to the transmutatory solution. In my own small crop of a few handfuls, after having selected the Kubanka from the Saxonka, I found that three mistakes had been made. And the very fact that the task of selecting the proper ears can be set even to the most careful people, shows that the mixture is intimate and the difficulties greater than the determination to overcome them. *A. Stephen Wilson.*

(To be continued.)

## ORCHARD HOUSES.

THE general failure of hardy fruit crops for the past two seasons has already aroused healthy symptoms of practical action being taken, which it is hoped will be prosecuted with energy and vigour until some scheme has been formulated by practical horticulturists which will give a better return for material and labour than the meagre crops of 1878-79. The subject is a comprehensive one to deal with. It necessarily embraces a variety of homogeneous circumstances, which require experienced discrimination to thoroughly unravel, so that no case will be treated otherwise than upon its own particular merits.

Orchard-houses may now be called an established institution in horticultural circles. They will soon be more: they are destined before long to become convalescent homes for recruiting the shattered energies of thousands of fruit trees which are either barren or are fast languishing towards decay. The form an orchard-house should take, its position, and other questions relative to structural formation, are now attracting attention, and it is well that the subject should be discussed for the benefit of those who rely upon the horticultural Press for sound advice and information.

With regard to the size an orchard-house should be, I rather fancy that should be left in the hands of the occupier or owner to decide. The size of the house ought, however, to be in proportion to the size of the garden, exactly as the grounds surrounding a mansion or the conservatory should bear a relative proportion to the size of the mansion itself. An exception would, of course, arise in the case of market growers, where appearance would be set aside in favour of utility. Coming nearer to the point an orchard-house may be made of great benefit in small gardens which are not enclosed by walls. It may be made to

answer the purpose of growing fruit, and also of affording protection to one side of the garden by excluding cold winds.

The position of an orchard-house should depend upon circumstances, and as the first expense is a consideration, the earliest situation would be chosen in large gardens where a supply of Strawberries, French Beans, early Peas, Cauliflowers, Potatos, and other vegetables and salads are in request during

and there were no existing walls which could be profitably utilised, I would decidedly prefer a capacious span-roofed house, running north and south, to any other, as affording the healthiest means of ventilation to the trees, as well as securing a maximum of sun and light.

There is yet another point I would urge upon intending builders, namely, that a narrow short house requires two ends and two doors as well as one that

changeable weather, cold frosty winds, alternating with hot blinks of sun; air must be admitted, and in narrow houses the quick succession of cold air entering the house in volume has not sufficient room to disseminate itself or become mixed with the internal air of the house before it comes into violent contact with the blossoms, thus rendering the organs of fructification abortive in their action. Now as to cool houses, it should be borne in mind that during the past season of 1879, and its immediate predecessor, we have not had sufficient sun to ripen the wood of fruit trees without having recourse to artificial means where it was available; and it should also be remembered that during the spring months we are frequently visited with clear bright days, when the sun, acting upon the glass, excites vegetation to a degree which can only be counteracted by artificial warmth, which will lessen the disparity between the day and night temperatures. It is therefore better to have the means of safety in the shape of a flow and return 4-inch hot-water pipe at hand in case of necessity.

A modern orchard-house should be abundantly ventilated by machinery. Stone fruits such as Plums and Cherries delight in plenty of healthy air, and for these the span-roofed form of house is certainly the best, as the opening of the ventilators may be reversed according to the quarter the wind blows from, thereby securing a constant circulation of air. A plan I adopted in the management of one of the worst houses in Great Britain was to nail a sheet of tiffany inside the front ventilators all the time the trees were in flower, and keep the water in the hot-water pipes barely warm. The experiment resulted so favourably that perhaps reference to the fact will prove useful in similar cases. The genial warmth barely noticeable from the pipes circulating with the air, broken up as it were into threads by the perforated tiffany, was just the atmosphere for stone fruits to set in.

Shelving for Strawberries and other plants should be fixed "underneath" the top ventilators in order that plants when in flower may not be in direct contact with cold air. If the orchard-houses of the future are not more successful than those of the past it is not because there is anything wrong in the principle, but because the work is not properly carried out in detail. *W. Hinds.*

### A DOUBLE PITCHER.

OF course Shakespeare was a botanist—nay, a teratologist! "What proof?" This—see *Midsummer Night's Dream*, act ii., sc. 2:—

"A double Cherry seeming parted,  
But yet a union in partition,  
Two lovely berries moulded on one stem."

A good many of us may, like Shakespeare, have seen such a Cherry, but we do not think even Shakespeare ever saw a "double Pitcher-plant," such as is represented in fig. 21. Neither do we think that Homer, before he became blind, ever saw one, albeit the double cup (*ἀμφικύπελλον*), such as Dr. Schliemann unearthed for us, and such as may be seen in the South Kensington Museum, is of such a form that, were it otherwise possible, it would not be difficult to imagine that its shape was suggested by some such appearance as that presented by the *Nepenthes* sent us by Messrs. Veitch. Of course, if Homer, or some of the potters of those days were spiritualists and clairvoyants, they would have had no difficulty in summoning up double Pitcher-plants to their aid; but that is at least a questionable assumption.

### Forestry.

THINKING SCOTCH FIR PLANTATIONS. — In my reply to the letter on this subject from Mr. Michie, forester at Cullen, in Banffshire, I suggested that he would do well to give us some instances of the sums realised from the extensive plantations under his charge, and he has promptly replied in last week's *Gardeners' Chronicle*, p. 77. The examples he gives, however, only show us his valuation of plantations which have evidently been comparative failures, the soil in one case being described by him as "too damp and clayey for Pine or Fir attaining age and perfection." Now the different reports quoted by me referred to plantations grown on suitable soil, and which had been judiciously thinned and brought to a successful issue. These reports were published in the *Trans-*

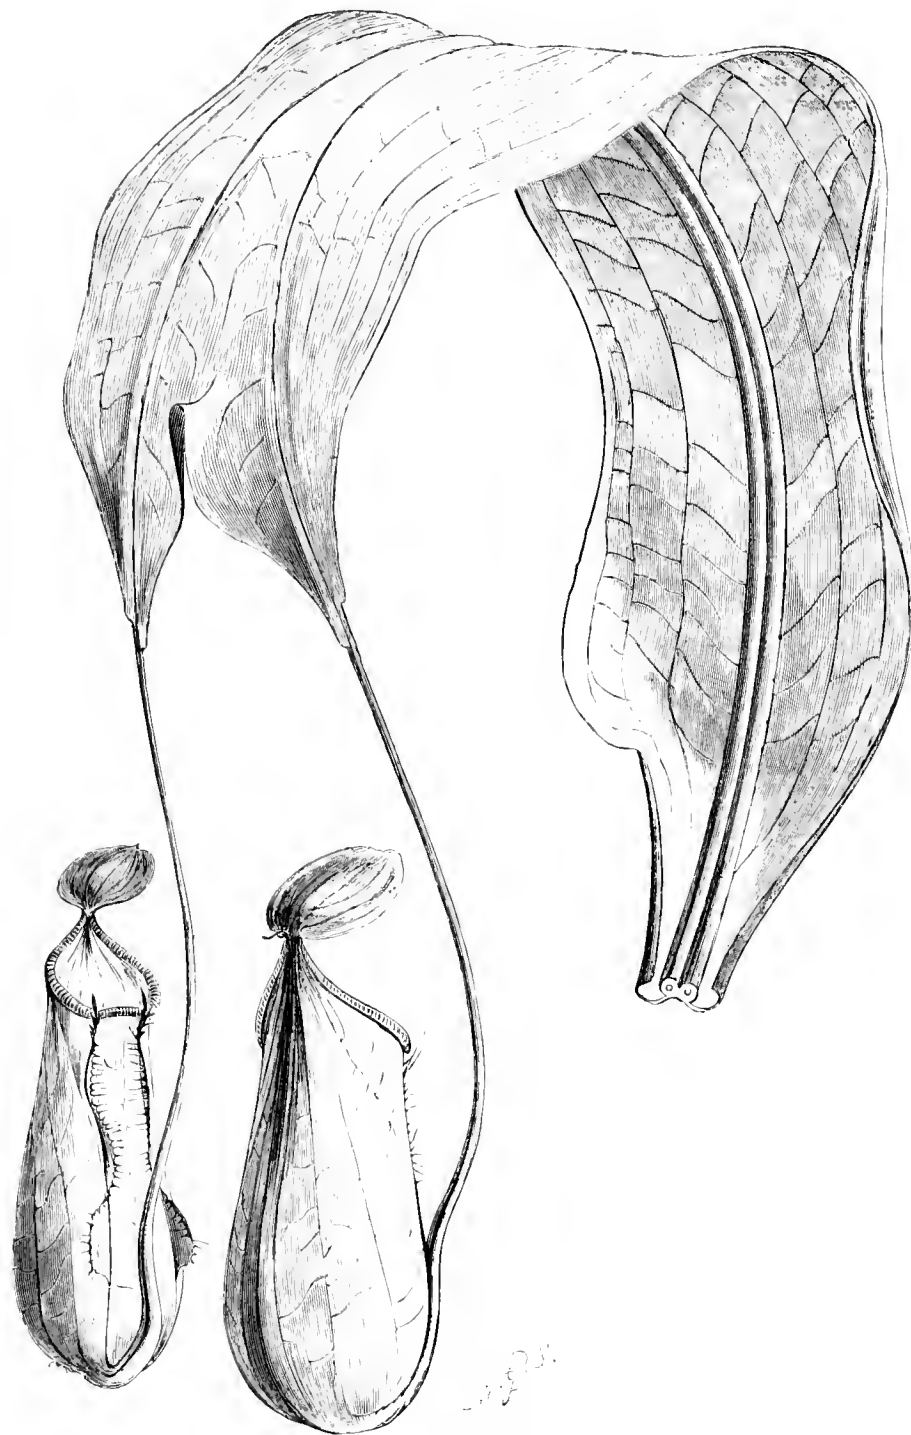

FIG. 21.—DOUBLE LEAF OF NEPENTHES ZEYLANICA.

the months of May and June. For this purpose, where there is a wall facing the south, it should be utilised, and in this case the house should be a lean-to with a hip-roof, and not less than from 16 to 18 feet wide, with a border 2½ feet in width along the back, and a path of the same dimensions, or a narrow grid path might be substituted with a 4½-inch brick wall, supported by light buttresses, running parallel with the outside of the path, in order to keep the trees trained on the back wall from travelling through the border where it was intended to be cropped with early vegetables.

If I were building an orchard-house or myself,

is larger. Many people who have not the benefit of practical advice think a small house must be comparatively cheap, which seems a reasonable assumption, while it is in fact proportionately dearer than the larger one. Take, for example, a house of any given size, 40 feet long, and express a wish to the builder of having it extended to 50 feet in length, and the comparative difference in the cheapness will be evident at once.

As regards the width of orchard-houses, I believe the original idea of having narrow houses has done more to render them unpopular than anything else. The reason is this: in the spring we very often have

actions of the Scottish Arboricultural Society, and were written by well-known foresters, who, without any collusion, confirmed each other in their estimates, that well-managed plantations of Scotch Fir had yielded, and would do so again, a yearly rent for the ground occupied by them during fifty years of at least £2 per acre. Now if Mr. Michie has not been so successful at Cullen, that is surely no reason why he should throw discredit on the reports of others who have been more fortunate.

In referring to those reports Mr. Michie tries to lessen their value by saying that "the writers had in view the gaining of prizes," but I cannot believe that a number of well-known practical men would sit down and concoct details without regard to truth, merely for the purpose of securing the prizes awarded by the Scottish Arboricultural Society, most of whose members are clever foresters, who would very quickly detect the fallacies of such "cooked accounts" and prevent them from appearing in their *Transactions*. If Mr. Michie declines to receive such reports as authentic, there is no use in bringing more of them under his notice, although that could easily be done; but neither are we under any obligation to accept the valuations he gives us as being trustworthy estimates of the maximum profit to be derived from young plantations.

Judging by the valuations given by Mr. Michie the demand for young timber in his district must be limited and the value much under that obtained elsewhere, but perhaps he will oblige us by going a little more into detail, and let us know the height and girth of a few of the Scotch Fir trees mentioned by him as being forty years old and upwards at the time they were valued, also the soils and exposure of the localities where they grew—and inform us at the same time if he always allows cattle to graze among the trees, as soon as the plantations are twenty years old.

I hope I am not asking too much, and it will be a very good result of our correspondence if it induces other practical foresters to follow Mr. Michie's good example and send us brief records of the progress and value of plantations under their charge.

The following questions would be easily replied to:—The rent of the land and date when planted; the original cost of plants and planting; the date of the different thinnings, and how many trees were taken out and how disposed of; the number of trees left on the ground at fifty years, and their average size and value. And in conclusion I hope Mr. Michie himself will now favour us with a valuation of some of his more successful plantations. *Wm. Baxter Smith, 4 Salcombe Villas, Merton.*

## Law Notes.

**ACTION FOR DAMAGES AGAINST A CHEMICAL MANUFACTURING COMPANY.**—At the Newcastle Assizes, on January 16, before Mr. Justice Lush, the case of *Charlton v. Russell and Others* was resumed and concluded. It was an action by a farmer at Low Walker to recover compensation for alleged damages to his crops by noxious vapours emitted from the defendants' chemical works.—Mr. Cave, Q.C., and Mr. Walton were for the plaintiff; Mr. Wills, Q.C., Mr. Seymour, Q.C., Mr. Waddy, Q.C., and Mr. John Edge were for the defendants.

The plaintiff had 6 acres of Barley, 7 acres of Oats, and 14 acres of Wheat growing on his farm at Low Walker, on the north side of the Tyne, which he alleged was very seriously affected in August and September of last year by noxious gases emitted from the defendants' works. Both the yield and the quality were affected, and he claimed £44 9s. 3d. for the loss he had suffered. Messrs. Russell's and Messrs. Hill & Sons' works are on the same side of the Tyne as the plaintiff's farm, and Messrs. Tennant's works are at Hebburn Quay, on the opposite side of the river, but by reason of their having two principal chimneys at a higher elevation than the other defendants' single chimneys, on the same side of the river, the plaintiff considered the damage had been caused equally by all the defendants. The defendants denied that noxious gases had been emitted from their works, and sought to show that the bad crops were due to natural causes and the inclemency of the season.

For the defence, a number of experts were called to prove that the several defendants conducted their works on the best principles and with the best appliances, and that the gases emitted were not injurious

to vegetation. The Alkali Act, 1874, required Messrs. Tennant and Messrs. Russell not to permit more than one-fifth of a grain of muriatic acid per cubic foot of smoke to escape from their chimneys, and the tests which were taken three or four times a week showed that Messrs. Tennant had always been within the limit, and Messrs. Russell considerably below it. Messrs. Russell's and Messrs. Hill's chimneys were about half a mile, and Messrs. Tennant's about a mile distant from the plaintiff's fields, and the gases which were allowed to escape were so diluted they were in no sense poisonous or injurious. The plaintiff's bad crops were due to the badly-drained, impoverished condition of the land, and the wet season which had affected all farmers.

The learned Judge, in charging the jury, said they had now arrived at the end of a very complicated, and to him, an incomprehensible case. It was the first time, he believed, since the passing of the Judicature Act that the section which enabled the plaintiff to join all three defendants, instead of bringing three separate actions, had been put in force. It was a very wholesome rule, and they now saw the advantage of it. After a very careful analysis of the evidence he finally left it to the jury to say whether the crops had been damaged or not by poisonous gases, or whether their bad condition was to be attributed to the bad season. If so, their verdict must be for the defendants; but if, on the other hand, they thought the damages were such as were over and above the damages caused by bad season, they must then consider whether the damages had been caused by the defendants or any of them, and if so, apportion the damages among the several defendants according to the evidence.

The jury found a verdict for the plaintiff, and assessed the damage against each of the defendants at £6 13s. 4d. The judge reserved questions of costs for further consideration. *Times.*

## Garden Operations.

### FLOWER GARDEN, ETC.

In a recent article on bedding (p. 71) I inadvertently omitted to name the two best hardy green-surfacing plants that have yet come under my notice; they are *Veronica repens* and *Herniaria glabra*. Both of these take care of themselves when once planted in good soil, and require no pinching, pegging, or clipping, the growth being naturally both dwarf and dense. Their hardiness is undoubted; for, after all the frost we have had this winter, they are looking as fresh as it is possible for plants to be, presenting a remarkable contrast to the much-used *Mentha Pulegium gibraltarium*, which has all but succumbed, perhaps more injured by wet than frost; still, it is not to be depended on for winter effectiveness, and requires the bestowal of so much labour in the summer that it may be predicted it will decline as rapidly as it rose into favour. It only winters well in the open air, when split up into little bits in the autumn, and planted on a south border that is well drained; in such a position, out of thousands of plants, not one has died, notwithstanding that the frost has upheaved most of them. They now require to be pressed firmly into the soil, together with other plants that the frost has similarly acted on, among which are *Sedums*, *Saxifragas*, *Sempervivums*, *Cerastiums*, *Pinks*, *Carnations*, and spring-flowering plants generally; shallow-rooting alpine and herbaceous plants may also require the same attention, but the protective mulching must still be retained to any of doubtful hardiness.

To some plants the present winter has been more fatal than last. *Phormium tenax* seems to be quite killed, and some of the *Euonymus*, neither of which were seriously injured last winter; the cause is, no doubt, in the succession of thaws and quickly recurring frosts whilst the plants were wet. *Eucalyptus globulus* is again killed, and seeds of it should be at once sown in heat for planting out in May. It is an effective "subtropical," being both in habit of growth and colour of foliage distinct from any other plant of such rapid growth, and withal it is the present "fashionable" plant. Ordinarily, in this part of the kingdom, *Cannas* winter safely in the beds; but last season's experience, when they were all destroyed, caused us this season to lift them, and they have wintered safely on the floor of a cool shed, the roots being covered with dry soil. Where it is desired to increase the stock, these roots should now be brought out and cut with a sharp knife or edging-iron into single crowns. Pot and place them in strong heat till new roots are emitted, and then grow them on slowly in a greenhouse temperature. Seeds sown in strong heat at once will make fine plants by bedding-out time. The outer

shell of the seeds is so hard that they should be soaked for a couple of days prior to sowing, and the same remark will apply to seeds of *Acacia lophantha*, one of the most graceful, though one of the commonest of plants that is used for subtropical planting. With the exception of *Castor-oil* plants (*Ricinus*), *Hemp* (*Cannabis*), and one or two of the coarser growing *Solanums*, all other kinds of subtropical plants that are usually raised from seed should now be sown; those named are apt to get pot-bound and stunted before planting time when started too early. Stock plants of those kinds of *Pelargoniums* that were not propagated in sufficient quantity in the autumn should now be placed in an intermediate temperature for the production of cuttings. February-struck plants are seldom, if ever, inferior to autumn-struck ones by planting time when grown on without check. *Verbenas*, *Petunias*, *Coleus*, *Iresines*, and plants of that class will all now need a minimum temperature of 65° to ensure a supply of cuttings, and as soon as these can be had propagation should be commenced.

There is nothing gained by beginning to propagate *Alternantheras* before March; at the beginning of that month they should be given a moist, strong heat, and cuttings will be had in abundance in a very few days, which are the most expeditiously dealt with by striking them in dung frames, there to remain till they are transferred to the beds.

The season for alterations and extra work is fast waning, and these should now soon be ended, or postponed another year, for the neglect of routine work soon ends in general untidiness, and can only be prevented by doing as suggested, that is, leaving behind all extra work as soon as the advancing season brings a multiplicity of jobs that will brook no delay. The planting and repairing of Box edgings, laying turf, gravelling and turning walks, are amongst the more important operations that should be completed forthwith, to be followed, as soon as the ground is sufficiently dry, by the completion of any deciduous tree planting yet on hand. In the event of frost again setting in, abundance of work will be found in cutting hedges, shrub pruning, soil and manure wheeling, and making up hotbeds for propagating purposes. *W. Wildsmith, Heckfield.*

### HARDY FRUIT GARDEN.

During the past fortnight but little change has taken place in the weather favourable to prosecuting ground operations in the shape of planting or surface-dressing of fruit trees. Previous to the frost the ground was in such excellent condition, that when the thaw set in here, and no rain of any account fell except on one day, we had, notwithstanding a succession of dull days, anticipated an early spring, and had already made preparation for commencing to plant; but a downfall of sleet and rain supervened, and the probability at present is, that the middle of the next month will see more planting done than any time during the present month of January. Looking at the arrears of work to be performed in the fruit garden up to the present date, one naturally feels anxious as to the future. There is, however, hope yet. The winter has been favourable for pushing forward work of a different character in other departments, and a good general who knows how to organise his forces and concentrate his strength upon any given point will see his way to tide over existing difficulties. Our soil for planting is made up into ridges like a triangle, and will be in a mellow condition at any time it is required for use. Peaches and Nectarines on open walls should have their borders and soil prepared according to the natural conditions of the locality.

The rainfall of the neighbourhood is a point that should be taken into account more often than it is, and the site of the garden, whether elevated or otherwise, should receive a due amount of consideration, as so much depends upon a healthy bracing air ripening the wood of fruit trees, and under these atmospheric conditions soil of a heavier nature might be used than in less favoured districts. If this were done and lime rubble and small pieces of broken bricks about the size of inch bones were used, together with giving the trees a circumscribed root-space, we should at least succeed in reducing the labour of the root-pruner, and probably secure a trifle more fruit than we do. Pear trees like an open fibry loam, with good drainage, which should be supplied artificially in wet situations, and they would also be benefited by being slightly elevated above the natural ground level and mulched in order to encourage roots to the surface, which will be rendered better and more fertile channels of supply than if they were allowed to travel in quest of food to a lower and more unhealthy region. Upon light soils and in undulating situations where there is a constant percolation of moisture passing away from the roots, the trees should be planted on a different principle by leaving a shallow cup or basin round the bole of the tree in order to be able to render assistance at the proper time with liquid manure. The most successful cultivator will be he who can draw most upon his own resources. With respect to wall trees where the wall copings do

not project sufficiently, and the roots of the trees are saturated by drip and the branches are of a greenish hue in winter, it is a sure sign that they are getting more moisture than is good for them. In planting small fruits, such as Gooseberries, in localities where birds are troublesome it is well to minimise, if possible, the labour of keeping these little marauders at bay. For late dessert purposes no plan of planting surpasses that of forming a low arch, say from 2½ feet to 3 feet high, of wire, with iron hoops to support it. It should be wide enough for a man or boy to pass up inside to gather the fruit without disturbing the net from the outside, so that the device will be a permanency all through the season of gathering the fruit. As the buds of fruit trees may be expected to swell rapidly with increasing light, the necessary provision will need to be made by way of protection. The pruning and nailing of Pears, Apples, and Plums on walls may be advanced at favourable intervals, however short; but the pruning of Gooseberries, unless where they can be netted, had better be deferred while the weather continues severe. The prickles are the best safeguard against birds. Orchards that have grown overcrowded should be thinned, and plantations of Damsons should have their branches skillfully adjusted while there is leisure to attend to these somewhat neglected departments of the early fruit garden. *W. Hind.*

#### FRUIT HOUSES.

**VINES.**—The cold wet years 1878 and 1879 having been most unfavourable to Vines in general, and late ones in particular, no time should be lost in making a careful examination of borders in which Lady Downe's, Alicante, and other kinds recently cleared of the past year's crop, are growing, and producing unsatisfactory results. The inclement months of January and February being unfavourable to the lifting and relaying of Vine roots in external borders, the occupants of these late houses do not always receive the attention they deserve, and on this account it often happens that the work is postponed, or partially performed; but it is only putting off the evil day—sooner or later our borders must be made, and as there is nothing like trying to set things right as soon as they are found to be going wrong, immediate preparations should be made for taking out the old and putting in the new soil. In the first place, a good supply of new compost, consisting of turf from an old pasture, lime rubble, burnt earth and crushed bones, should be got ready for use, either in an open shed or where it can be protected from rain; and to save valuable time in cleansing the old drainage, a liberal supply of clean broken bricks or stones may be prepared and placed near the borders about to be operated upon. This portion of the work having been got over, advantage may be taken of the first mild settled weather, with all hands, for freeing the roots from the old compost, and clearing everything away down to the concrete. All the roots should be carefully preserved as the work proceeds, and prevented from getting dry by being tied up in damp mats and secured near the front wall-plate of the house. Having ascertained that the outlet from the bottom of the border is satisfactory, place from 12 to 18 inches of drainage on the concrete, reserving the finest for spreading over the surface. Place thin turf, grass-side downwards, all over the drainage, and having decided upon the width of the new border—6 to 9 feet is wide enough—build the front or retaining wall with soils also. Wheel in the compost, and beat firmly with steel forks, if at all damp or inclining to be wet, in preference to trampling, until the bed has been raised to within about 9 inches of the ground line. The relaying of the roots may then be proceeded with by taking those which emerged from the deepest part of the internal border first. Shorten back all the strongest, and continue the addition of the soil in thin layers so as to keep them separated from each other until all have been disposed of, and the border has been raised some inches above its proper height to allow for settling. When all is finished some covering should be used for keeping out frost and throwing off rain and snow, as dryness of the soil about the mutilated roots is an advantage when the sap is rising. Assuming that these Vines, as all late Vines should, have good substantial internal borders, liberal supplies of tepid liquid will keep them going through the early stages of growth, and as the season advances they will gather strength, and finish off good crops of fruit; the only difference being perhaps smaller bunches of perfectly fertilised berries which invariably colour well. With one exception all the houses at this place have internal and external borders, and this arrangement enables me to take out one or other without risk of injury to the Vines or having to sacrifice a crop of Grapes. *W. Colerian, Eastnor.*

#### MELONS.

If these have been sown as advised in the last Calendar they will now have made their first rough leaves, with the development of which there will be a corresponding increase of root-action, which will necessitate their receiving a shift into pots a couple

of sizes larger, and being again plunged in a bottom-heat from 75° to 80° near the glass, a small stick to be put to each plant for its support until grown on large enough for transferring to the hillocks in the Melon-house. But those plants which are intended to be planted in pits and frames, and trained over the surface of the beds, can be planted out as soon as they require more room at the roots. The Melon delights in a good turfy loam, which has been cut and stacked the previous summer. The top 3 inches from a deer or sheep-park when to be had, or from a down which has been grazed by sheep, is the best possible soil for the growth of Melons and kindred subjects requiring a loamy soil. As a rule, loam of this description without the addition of any other ingredient will be sufficient, so far as the suitability of the soil is concerned, for the production of first-rate Melons. The turf should be chopped into small pieces—a couple of inches long. However, if the loam at hand should be of a stiff and adhesive nature, old lime rubble or charcoal must be added in sufficient quantity to render it somewhat porous, and if the loam should be of a poor description, one-fourth of well decomposed short dung, free from worms, should be added. After which the whole should be turned over twice to mix it, and when moderately dry got into the pit or frame—the same having been thoroughly cleansed—the brickwork washed with hot lime, the wood-work with soft-soap and warm water, the glass with water only—previous to putting the soil in. Make a hillock in the centre of each light, by putting a barrowload or more of soil, according to the size of the light, in each, and leave a space of 10 or 12 inches between the surface of the hillock and the glass. In planting (the soil having been in the pits or frames a few days previous, to get warm) put two plants in each light, so that in case of one or other of them dying off through damp or other causes there may be no inconvenience experienced. Should all the plants grow and flourish, the shoots can be thinned-out to the proper distance, and more fruit obtained from each light than could be secured from one plant. In planting press the soil firmly around each plant, taking care, however, not to press the stems of the plants in doing so, inasmuch as they are very susceptible of injury from pressure of any kind when in a young state. See that the plants are moderately moist at the roots before turning them out of the pots, and then, as recommended on various other occasions, make a circle of quicklime and dry soot around each plant, which will serve a double purpose, namely, that of preventing an unnecessary amount of moisture settling on or near the stems of the plants, and also of keeping slugs—which if not guarded against are very destructive—at bay. When the plants have commenced to grow stop them at the third rough leaf, and maintain a good steady bottom-heat as advised above. Let the day temperature without sun range from 70° to 75°, running up 10° with sun, night temperature from 65° to 70°. Sow a few more seeds for succession, &c. Get some more fermenting material in readiness for linings, &c. *H. W. Ward, Longford Castle.*

#### CUCUMBERS.

The plants which have been producing fruit all the winter will now be the better for having the surface-soil of the bed removed and replaced with an admixture of three parts of light loamy soil and one of short dung and leaf-mould. This top-dressing will have an invigorating and beneficial influence upon the plants. See that the young growths are kept tied up to the trellis, but not too tightly, for this would be very injurious, if not positive and ultimate ruin to the shoots in developing their growth. Avoid overcrowding the shoots, and keep the plants in a clean and growing state. Shift young plants as they require more room, and keep them near the glass till ready to plant for trellis training, putting a stick to each plant for support. The soil, being composed of the ingredients above referred to, and in the same proportion, with the addition of a little charcoal, in sufficient quantity to render the whole porous, may be got into the pits or frames, and made into ridges or hillocks, as recommended for Melons. The same treatment may be followed with plants intended to fruit in pits or frames without trellises, as also advised for the Melon, stopping as soon as the plants have made a fresh growth, say at the third leaf. The same holds good respecting bottom-heat, whether obtained by hot-water or fermenting material, &c. *H. W. Ward.*

#### PLANT HOUSES.

**STOVES.**—Now that the days are gradually lengthening, and the sun, so long absent, is at last making its presence felt, the temperature of these structures may with advantage be considerably increased, especially on bright days, when the fires should be started by 1 o'clock or so, to aid with the solar rays in imparting a good brisk heat, which, with plenty of atmospheric moisture at the same time, will soon rouse the plants and start them into a state of activity. Growth, however, produced in the absence of full light is never satisfactory, and therefore when the weather is dull and gloomy, thermometers ought not to be pushed much above 70°, for comparative

rest under such circumstances is only natural, and it will always be found that any apparent loss of time is more than made up afterwards in the better results attained. As the majority of stove subjects will soon require overhauling and repotting, it is a matter of the greatest importance that a sufficient stock of soil for the purpose be got somewhere under cover without further delay, that the dead chill may be taken off, and it may otherwise be rendered fit for use when wanted. In cases where either the peat or loam is infested with worms or insects it is a good plan as a preparatory process to subject the sods to a strong heat by packing them over the tops of some of the boilers for a day or two that they may have a baking, which is not only destructive to any pests of the above-named character, but is fatal to any eggs or larvae that may have found a home therein. Among tuberous-rooted plants that require immediate attention none are more highly prized or useful for general decorative purposes than Gloxinias, a batch of which should be started at once by bringing them from their winter quarters and standing them where they can feel an increase of heat. It often happens when these are first put to work that they are lost through over-watering, as after being somewhat shrunken in resting they absorb more moisture than they have any outlet for, and instead of pushing forth leaves and roots they rot. The safest way is to let them remain in the old ball of earth till they are on the move, or if repotted to give no water beyond what they get in syringing or just damping the surface till the tips of the leaves begin to appear, and the same with Caladiums, which are equally affected by sudden change at the particular stage already referred to. Achimenes succeed best pricked out and started in pans of finely sifted leaf-mould, or peat and sand, from which they can be transferred later on to the pots it is intended they should be flowered in. In the way of seed to be sown now, that of Gloxinias, tuberous-rooted Begonias and Cyclamens should not be forgotten. The two former, being so exceedingly fine, require great care and attention to get them up, which can only be done by making the soil perfectly smooth and then sowing on the surface, where just a sprinkling of very fine sand may be shaken. To obviate having to damp or water till the seed germinates, it is necessary to cover with a bell or a sheet of glass and place the pan containing it in strong moist heat out of reach of the sun till the tiny plants appear, when more light is essential to their well-being.

#### GREENHOUSES.

In the arrangement and management of these, the great point is to so distribute what flowering plants there are available as to make the most of them, standing them well up above others that they may be seen to advantage. Epacris and Heaths, being very impatient of dry heat, should be placed as far from the pipes as possible, as otherwise, during a frosty time, they are apt to suffer through a too rapid root desiccation, which starves the bloom and detracts much from its beauty. To have herbaceous Calceolarias fine and healthy, they must have no check, but be potted on, as they require it, giving them rich fibry loam and leaf-mould, and a genial temperature of about 45° by night, rising 5° or 10° more by day according to the state of the weather. A light pit where there is a hot-water pipe along the front suits them best, but failing this, a shelf in any moist house will do. Cinerarias, too, that are growing on for late work require similar treatment and are much benefited by being syringed freely on the afternoons of bright days. Any that are in a more advanced stage and pushing up their flower-stems, will be greatly improved in strength and vigour by frequent applications of liquid-manure, as being gross feeders stimulants are needed to keep them well up to the mark. Although young Fuchsias are preferable for general decorative purposes, they cannot be had so early in bloom as old plants, which pruned-in and started now in anyinery will soon break and be ready for shaking out and potting. It is the practice with some to carry out this latter operation as a first preliminary, but there can, I think, be no question that the shoots start stronger and more regularly before the roots are disturbed, and that they take more readily to the new material after, which being quite fresh, induces growth at a great rate. Any that are misshapen will come in most serviceable for affording cuttings, or for planting out in borders, Chrysanthemums are at last receiving the attention their merits deserve, for assuredly there are no finer decorative things in existence. Cuttings put in now make the most useful plants, but the thing with them is, that they receive no coddling or get treatment which causes them to become etiolated and drawn. The less heat they are subjected to in striking them the better, and all they require is just the shelter of a handlight stood on a slate in any light frame or pit where they can be kept close for a time. Stocky short-jointed shoots are the ones to choose, which taken off about 3 inches long, and inserted around the side of a pot in sharp soil, root in a fortnight, when they at once require more air. *J. Shepherd.*

## APPOINTMENTS FOR THE ENSUING WEEK.

WEDNESDAY, Jan. 28	{	Sale of 13,000 Lilliums, &c., at Stevens' Rooms.
THURSDAY, Jan. 29		Sale of Orchids, at Stevens' Rooms.
	{	Nursery, Fording, by Prudhoe & Mothers.
SAURDAY, Jan. 31		Sale of Miscellaneous Plants, &c., at Stevens' Rooms.

THE receipt of the balloting list for the officers and Council of the ROYAL HORTICULTURAL SOCIETY reminds us that the annual meeting of the Society is nigh at hand. The meeting in question would be looked for with some interest if there were reason to hope that any light was likely to be thrown on the anomalous position in which the Society is placed with reference to its Kensington landlords. As is well known, a lawsuit to settle the intricate questions involved is pending, but so far as we can learn little or nothing has been done in the matter, and unless a surprise is in store for us, the Council will be able to tell us little that we did not know before. So far as we make out, the Society is in the position of a tenant who is unable to pay his rent, but who refuses to be ejected till he has been compensated for money laid out on the property, and which money he has borrowed at the express instigation of the landlords, and virtually on their security. This money was advanced by the debenture-holders, in whose interest the Society, albeit they have forfeited their lease, still hold to the gardens and to the property they have erected in and on it.

There is thus a "triangular duel" between the Commissioners, the Society, and the debenture-holders. The result of such a contest, involving so many cross issues, no man can guess, much less predict. In the meantime, as the matter is, or soon will be, *sub judice*, it is advisable to say no more about it at present, but quietly to wait the upshot. Meantime, there is every hope that the Society will carry on as before, its valuable though unobtrusive labours at Chiswick and in the several committee-rooms. Were these matters safeguarded, we could well feel resigned if the Society's tenure at South Kensington were to cease for all purposes except that of holding shows and committee meetings.

So far as the annual reconstitution of the Council is concerned, that is a matter upon which comment may without impropriety be made. Three gentlemen are recommended by the Council to be removed—Mr. J. T. D. LLEWELYN, Colonel MAKINS, and Lord SKELMERSDALE. The resignation—we should say the proposed "removal"—of the first of these gentlemen is a distinct loss to the Society, the removal of the other two, and more especially of Lord SKELMERSDALE, can only be looked upon as gain. His Lordship on election had the goodwill and support of the horticulturists, and it was hoped from his antecedents at a sister society that a useful and valuable member of Council had been secured. This has not proved to be the case, for what reason we know not. To fill these three vacancies the Council propose the names of Mr. W. HAUGHTON, a man of business, who has done the Society good service though not too sympathetic with horticulture; Sir HENRY SCUDAMORE STANHOPE, Bart., and Rev. H. HARPUR-CREWE: concerning whom we would only say that we wish there were more of that excellent stamp of horticulturist on a horticultural Council. If we remember rightly an implied promise was made by the Council last year, or by the President in their behalf, that Mr.

W. B. KELLOCK should this year be proposed for election. We do not know what reason there may be for the non-fulfilment of this promise, but looking to what has been done or rather not done by the two gentlemen elected last year and removed this, it is pretty clear that those who on the last occasion supported Mr. KELLOCK had juster ideas of what constitutes a working member of Council than those by whose agencies two councillors were elected last year, to be removed from their seats this. No change is proposed to be made in the list of officers.

— ART IN THE CONSERVATORY.—The double-page lithograph plate which we publish to-day includes a selection of a few of the smaller examples of picturesque garden architecture, constructed by Messrs. MESSENGER & Co., of Loughborough, from designs by Mr. MAURICE B. ADAMS, A.R.I.B.A., of London. We give them as additional illustrations of Mr. ADAMS' paper, printed on p. 104 of this number, on "Art in the Conservatory and Greenhouse," which was read last week before the Leeds Architectural Association. Our drawings are taken from the series of thirty designs referred to by the writer, and include two floral porches, an octagonal conservatory with aquarium, a summer-house, and a belvedere. The porches are adapted, the one for a principal entrance, and the other for a garden or side doorway of a country or suburban residence, both being arranged either for flowering or foliage plants. The space usually occupied by stages is planned as natural flower borders, with side shelves over. Tinted glass is introduced in quarry-glazing in the upper parts of the vertical lights, as in the octagonal conservatory, in the centre of which a tank in several compartments is fixed for a few fish and aquarium objects. Ventilation is here obtained in the central cupola side-lights, worked from below. The summer-house and belvedere are placed in the grounds of a rural villa, and are constructed of wood—the former being roofed with thatch, the latter with red tiles. White is used as the external finishing colour in all the instances illustrated.

— BARKERIA CYCLOTELLA.—On Professor REICHENBACH's authority we have to announce that the woodcut in our last issue, taken from Mr. BULL's plant exhibited at the last meeting of the Royal Horticultural Society, does not represent *B. cyclotella* but probably *B. elegans*. We regret the circumstance, but are not responsible for the error, as the plant in question was exhibited and certificated as *B. cyclotella*, and was pointed out to us as such by the exhibitor.

— ROYAL HORTICULTURAL SOCIETY.—The gentlemen officially recommended for election as members of the Council at the annual general meeting, to be held on February 10, are W. Haughton, Esq., a former member; Sir H. Scudamore Stanhope, Bart., Holme Lacy, Herefordshire; and the Rev. H. Harpur-Crewe, Drayton Beauchamp Rectory, Tring. The retiring members are J. T. Dillwyn Llewelyn, Esq., Colonel W. T. Makins, M.P., and Lord Skelmersdale. The Council also recommend the appointment of Lord Aberlure as President; Henry Webb, Esq., as Treasurer; Dr. Hogg as Secretary; Lord Alfred S. Churchill, Henry Webb, Esq., and Wm. Haughton, Esq., as Expenses Committeemen; and R. A. Aspinall, Esq., John Lee, Esq., and James F. West, Esq., as Auditors.

— THUIA ERICOIDES.—Mr. MEEHAN, who some years ago stated that this was only a juvenile state of *Thuia occidentalis*, is enabled to confirm his opinion, as one of his plants has assumed the adult form, and, moreover, has produced cones not differing from those of the American *Arbor-vitæ*. *Retinospora squarrosa* in like manner has been proved to be a state of *R. obtusa*.

— FUCHSIA JEAN SISLEY.—Mr. CANNELL has sent us flowers of this French hybrid, raised between *F. spectabilis* and *F. Dominicana*. It is one of the most brilliant of its race, and must be a charming shrub for a conservatory. The flowers have a tube  $\frac{1}{2}$  inch long, fully half an inch in diameter at the mouth, and slightly tapered to the base. This is of a brilliant crimson-scarlet. The four sepals are each

just an inch long, crimson at the base and passing into green at the tip. The four petals are spreading, measuring  $\frac{1}{4}$  inch across the face of the flower, and are nearly round, a little wavy at the edge, slightly narrowed to the base where they are affixed to the mouth of the calyx tube, so that they are strictly roundish obovate; these are of a brilliant orange-scarlet. Altogether, we have not previously seen so brilliant a *Fuchsia*, the flowers very far eclipsing the figure in the *Revue Horticole* as to form, size, and colouring. The leaves are elliptic, about 4 inches by 2 inches, of a deep almost olive-green, and purplish on the under surface.

— AINSLIEA WALKERI.—We had occasion lately to mention this as likely to prove a useful addition to our list of ornamental greenhouse plants. The plant is not Himalayan, as we supposed, but is a native of Hong Kong, and is figured in the *Botanical Magazine*, tab. 6225.

— PRESENTATION OF A TESTIMONIAL TO MR. JOHN SADLER.—It having been made known that on account of Mr. SADLER's appointment by Government as Curator of the Royal Botanic Garden, Edinburgh, he was obliged to retire from the position of Secretary of the Scottish Arboricultural Society—a position which he had held with great skill and energy for nineteen years—the members of the Society determined to present him with some tangible proof of their appreciation of his services. Consequently on the 15th inst. a deputation from the Society, consisting of Robert Hutchison, Esq., F.R.S.E., of Carlisle, Wm. Gorrie, Esq., President of the Edinburgh Botanical Society; Jas. Alexander, Esq., Redbraes; James Alexander, Esq., Jun. (of Messrs. Dicksons & Co.); Messrs. McCorquodale, Scone; Dunn, Dalkeith; John Lamont, Jun., Musselburgh; and France, Penicuik, waited upon Mr. SADLER, at the Royal Botanic Garden, and presented him with a handsome gold watch and appendages, and a purse of 100 sovereigns as the gift of the Society. Mr. HUTCHISON, in making the presentation, referred in appropriate terms to the valuable services rendered to the Society by Mr. SADLER, who undertook the office of Secretary at a time when the very existence of the Society was flickering in the balance between life and utter extinction, having battled sore for life for seven years previous. The advent of Mr. SADLER seemed to infuse new energy and life into it, and it had gone on ever since increasing and flourishing under his fostering care; and instead of being, as it was nineteen years ago, a mere name, it was now one of the most important institutions in the country. This state of things was due in every respect to the energy and indomitable perseverance of their Secretary; and while the Society felt that they had sustained a very great loss in his being obliged to resign his official connection with them, they at the same time felt glad at the causes which brought that about—his receiving an important Government appointment, which his talents and general acquirements so well fitted him to occupy. Mr. SADLER, in reply, said that words failed him to express the gratitude he felt at the munificence of the Society in presenting him with such a substantial token of their regard. To be the secretary of such a Society as the Scottish Arboricultural was to him a sufficient honour, and although during his term of office it had certainly gone on increasing, that fact could be attributed to other causes than his direct official connection, and to none more so than to the influence thrown into the Society by Mr. HUTCHISON himself, than whom none had done more for its welfare and prosperity. He should always take the warmest interest in its well-being, and should at all times be glad to give what assistance he could to promote its general good. In the name of himself and family he desired to express his deep gratitude for their handsome gift. The deputation was then entertained to cake and wine. In the afternoon a complimentary dinner to Mr. SADLER took place in the Albert Hotel, with Wm. McCORQUODALE, Esq., Scone, in the chair, and Mr. BULLEN, Glasgow Botanic Garden, croupier. The watch and chain presented to Mr. SADLER was furnished by the jewellers to the Society, Messrs. G. & M. CRICHTON, Princes Street, Edinburgh, and reflected the highest credit on the skill and taste of that eminent firm. On the outer case of the watch is a beautiful engraving of the well-known arms of the Society, with its appropriate motto—"We may be aye stickin' in a tree; it will be growin' when ye're sleepin'." On the inner

case the following inscription is neatly engraved :—  
 “Presented by the members of the Scottish Arboricultural Society to JOHN SADLER, Esq., Curator of the Royal Botanic Garden, Edinburgh, as a token of esteem and regard, on his retirement from the secretaryship, after nineteen years' faithful service.”

— EVERGREEN PEACHES.—Messrs. STUART, MEIN & ALLAN, of Kelso, have sent us a few Peach leaves which have remained quite green up to the present time, notwithstanding that the thermometer in the Kelso Nurseries registered 12° below zero last month.

— A GOOD ARTIFICIAL MANURE.—M. WOERH-LIN recommends the following as generally suitable :—

Nitrate of ammonia	.. .. .	40
Phosphate of ammonia	.. .. .	20
Nitrate of potash	.. .. .	25
Sulphate of lime	.. .. .	5
Sulphate of lime (soluble)	.. .. .	6
Sulphate of iron	.. .. .	4
		100

The quantity to be used depends on the nature of the plant, its leaf-surface, &c.

— THE ROYAL HORTICULTURAL SOCIETY'S "JOURNAL."—Part 9, which completes vol. v., has just been issued. It contains a brief record of the Society's proceedings from April 22 to August, 1879, including the awards of the judges made on May 27, June 2, and July 8; the concluding portion of the report on Gloxinias grown at Chiswick; and some valuable notes on the genus Tulipa, by Mr. H. J. ELWES. We note an error on p. 145 of the *Proceedings*, which, to avoid confusion, it may be well to point out at once. The name of the Melon which received the First-class Certificate on May 13 is not "Devonshire Early" but "Davenham Early." It was raised at Davenham Bank, Malvern, the residence of J. D. PERKIN, Esq. The index to the *Proceedings*, especially of the Scientific Committee, is a valuable innovation, for which our best thanks are due to the Editor.

— EMBRYO SAC.—The *Quarterly Journal of Microscopical Science* contains a paper by Mr. H. MARSHALL WARD on the embryo-sac and development of *Gymnadenia conopsea*. The young ovules are very slightly curved structures, each consisting of an axial row of large polygonal cells surrounded by a layer of somewhat smaller ones. The terminal cell of the axial row increases considerably in size, and has been called the embryo-sac mother-cell, since the embryo-sac originates from it. Four cells more or less clearly developed may be said to arise from it by three successive divisions. Of these cells the two upper are much compressed, and form mere "cap-cells" to the two lower, between which the division wall always remains excessively weak. The four cells may be regarded as four spores, the upper two being nearly suppressed. In each of the lower cells the nucleus divides successively into four. Of the upper of these groups one division becomes the egg-cell; two others intervening between it and the wall of the embryo-sac form together with it what is called the egg-apparatus and play some part in the process of fertilisation. The remaining division falls freely into the living protoplasm of the embryo-sac, and it is probable, judging from a comparison with other cases, that it fuses with a division from the lower group to form the nucleus of the embryo-sac, which is thus itself formed by the fusion of two cells. The remaining divisions of the lower group remain sterile, and may be regarded as vegetative and not reproductive. The embryo-sac mother-cell, therefore, to sum up, gives origin to two atrophied spores, one fertile and one sterile.

— ORCHIDS AT THE VICTORIA AND PARADISE NURSERIES.—Many fine specimen Orchids are just now in great perfection of bloom here. There are literally hundreds of flowers now open. Amongst the more conspicuous are two very fine examples of *Lælia anceps*, one of which had fourteen spikes and the other fifteen of its noble heads of flower fully expanded—a grand sight; some fine specimens of *Cœlogyne cristata*, nearly 3 feet in diameter, with an abundance of snowy white flowers just expanding; and two large specimens of *Angræcum sesquipedale* in full beauty, the white waxy-looking flowers being very large. We were pleased to see many good plants of *Sacco-*

*labium giganteum*, some of them 18 inches high, with a profusion of sweetly perfumed flowers drooping over the foliage. Some of these have been in bloom for six weeks, and now there are many spikes opening. *Lycaste Skinneri* is finely in bloom, also the new *Oncidium curtum*, which has most lovely flowers. There are three varieties here, some of the blooms being large, golden-yellow and crimson in colour. Of *Odontoglossum Alexandre* there are several plants which were imported last year by Mr. WILLIAMS, amongst them being some very good varieties. Amongst the *Maslevallias* there are several of *M. tovarense*, carrying its snow-white flowers; *Odontoglossum cristatum* is also well in blossom, as well as several plants of *O. cirrhosum*, one of which is a large showy variety. Next to this is the pretty *O. madrese*, and a fine plant of *Oncidium macranthum*, showing two spikes of flower, which will soon be in bloom. In the East Indian-house the *Vandas* are showing well for bloom, and the true *V. suavis* is in full beauty with two spikes of flowers. A specimen of *Phalenopsis Schilleriana* is coming into bloom with four spikes; it is the largest specimen we have ever seen, and produced upwards of 300 flowers last year. There are also six varieties of *Cypripedium*, with many flowers, and which have been blooming all the winter. There has been a large show of *Calanthes*, but they are now getting far advanced and are losing their beauty, with the exception of *Calanthe Turnerii* which is just opening its pretty blossoms. There are many other Orchids in bloom, but we have only mentioned a few of the best.

— HORTICULTURAL CLUB.—The annual meeting and dinner took place at the Club-house on January 13, when it was announced that during the year a further sum had been invested in the Funds, leaving also a balance in hand at the end of the year. Mr. JOHN LEE was re-elected Chairman, and the names of Mr. GEO. PAUL and Mr. T. FRANCIS RIVERS added to the Committee. Much satisfaction was expressed at the excellent arrangements of the Club, and those present undertook to do what they could to still further increase its numbers and thereby extend its usefulness.

— CATALPA SPECIOSA.—The credit of the discovery of this tree is due, not to Professor SARGENT, as we inadvertently stated, but to Dr. WARDER. Professor SARGENT informed us of the mistake, which we accordingly corrected, not in time, however, to prevent its being stigmatised as a "European error." Dr. WARDER found, as long ago as 1853, in the streets of Dayton, Ohio, some *Catalpa* trees of more erect habit, and which bloomed two or three weeks earlier than the common sort, *C. bignonioides*. The flowers were larger and more showy, being whiter, hence the name *speciosa* was applied to it, and nurserymen were urged to confine their propagation to this variety, as it was then supposed to be. Two brothers, J. C. and E. V. TEAS, of Raysville, Indiana, propagated it largely and distributed it widely as an ornamental tree, and sent it out under this name. For the last two years Dr. WARDER has been investigating this tree, and endeavouring to trace out its natural habitats, and comparing it in these respects with *C. bignonioides*. In so doing the Doctor has travelled over 5000 miles. Dr. WARDER mentioned this as a new *Catalpa* in 1853 in the *Western Horticultural Review*, then under the editorship of the worthy Doctor. Dr. ENGELMANN stood sponsor for the new *Catalpa*, and gave it its name, *speciosa*. Whether this tree will prove of any value in this country has yet to be proved, but it is very doubtful, as we believe some growers have experienced difficulty in keeping the seedlings alive, even with the protection of a frame.

— FOSSIL PLANTS OF SHEPPEY.—In the rapidly wasting mud cliffs of the Isle of Sheppey are stored up the remains of a vegetation which once clothed the island with forms very different from those which now grow on the banks of the Thames. These Sheppey fossils have long attracted the attention of the naturalist, but a more complete investigation of them has lately been made by Professor Baron ETtingshausen, who has contributed the results of his investigations to the Royal Society. The Professor enumerates 200 species, distributed into forty-one families. The climate must have been of a sub-tropical character, as is evidenced by the occurrence of leaves of *Musa*, *Pandani*, several Palms, *Agave*, *Smilax*, *Proteads*, *Cinchonads*, *Loganiads*, *Sapotads*,

*Ebenads*, *Byttneriads*, &c. Some of the fruits and seeds are supposed to belong to genera which no longer exist in a living state, and it is interesting to note that the number of these extinct forms is relatively much larger than in the newer Miocene strata. Among the coniferous plants seeds of *Salsburia* have been found.

— MARKET GARDENS.—It is well for market growers of garden produce that they are naturally endowed with an abundance of fortitude and faith. Several years of bad seasons and poor crops, with consequent wretched returns—which the widespread commercial depression has helped to render even smaller during the past winter—might well make men pause in the yearly routine of work and ask whether market gardening has not seen its palmiest days. Within 20 miles of the metropolis thousands of acres of good land have been converted from agricultural uses to the produce of vegetables and fruits, rents consequently have gone up to the maximum, and with it rates and taxes are most oppressive. Though near to London, yet, as compared with growers of market vegetables more remote, market gardeners are heavily handicapped, by reason of the large payments to be made out of profits for the above purposes, besides the greater cost of labour, which averages 18s. to 20s. per man per week throughout the metropolitan district. In spite, however, of all these drawbacks the growers are again sowing and planting and preparing for the coming summer, with the same determination that was evinced when a few years ago all was *couleur de rose*. No doubt it is the right thing to do, even though the obstacles to progress are many. Remissions of rent are rarities amongst market growers, perhaps because they do not present in the aggregate such an important political factor as does the great body of tenant-farmers, or it may be that their more intimate relation to active business pursuits renders them more reliant on their own efforts and less dependent upon landlords. Professionally and nationally we cannot but desire that the cycle of bad seasons for our market gardeners has passed by, and that a long period of prosperous and fruitful ones is now in store for them.

— SOWING CELERY SEED.—Those who grow Celery for exhibition in August and September sow the seed about the middle of March in a hotbed stimulated by a gentle heat, covering the bed with about 2 inches of light soil, with which is mixed a good portion of clean sharp sand, and on this the seed is scattered thinly, not covering it, but simply pressing it into the soil with a smooth flat piece of board or something of the kind. When the plants are up damp has to be guarded against if the weather be moist and too cold to admit of much air being given. When damp occurs it is a pretty safe practice to dust some fine dry white sand over the leaves, which, while it checks the spread of damp, incites the plants to make growth. A bed is then prepared on a warm border made up of rich soil, and on a dull growing day the plants are pricked out here, and shaded from the sun and screened from spring frosts till strong enough not to need protection, and finally they are placed out in the Celery trenches.

— A SANITARY VIEW OF THE PAST YEAR.—Writing to the *Times* on the 19th inst., Mr. BAILEY DENTON points out that the year just closed (1879) has been subject to several meteorological conditions of an extraordinary, if not exceptional, character, which may have a future as well as a passing influence. Not only has the rainfall of the summer months—April to September inclusive—on the eastern (corn-producing) side of the country amounted to as much as the average fall of twelve months during the last sixty years, but the number of wet days has been as many as two out of three, while the temperature has averaged very nearly 5° below the mean. Thus the rain of summer, which is generally evaporated as it falls, has found its way into the ground and helped to replenish the subterranean supplies. Unlike the condition of former years, the writer's gauge-well (at Stevenage), 70 feet deep, has continued to rise without intermission from January last (1879) up to the present time, and Mr. BAILEY DENTON believes this to be an indication of what has generally occurred. It is fortunate that such has been the case, for the rainfall of the three principal months upon which all the rivers and springs of this country depend for their summer flow—

October, November, and December — has been unprecedentedly small. The average fall of rain during these three months in the east of England is close upon 7 inches. In the last year the amount barely reached 2½ inches, and this is rather less than the rainfall of any one of the summer months. Though it is certain that the excess of filtration over evaporation during the last summer will go some way to make up the deficiency of October, November, and December, it is not improbable that the general water supply of the country will be deficient during the coming summer, and it may be well to point out to rural sanitary authorities that they should watch with great care the condition of wells upon which the inhabitants of villages depend for water, inasmuch as the unsatisfactory quality of this description of supply will necessarily be rendered worse by the deficiency of the rainfall during the three months to which Mr. DENTON has called attention. Speaking generally, that deficiency has amounted to 4½ inches.

— THE USE OF THE FEET IN SOWING SEEDS. — Mr. PETER HENDERSON recommends the use of the feet in sowing seeds, and computes the loss to the American horticulturists through the neglect of the simple operation of firming the soil around seeds to amount to an enormous sum annually. The market gardeners cultivate thousands of acres of Cabbage, Cauliflower, and Celery, but their seed-beds failed last year, Celery not being one-fourth of a crop, and Cabbage and Cauliflowers hardly half. This failure he believes is due to no other cause than that they persist in sowing their seeds without even taking the precaution to make the soil firm by rolling. Mr. HENDERSON sows annually about 4 acres of Celery, Cabbage, and Cauliflower plants, which produce probably 5,000,000 in number, which in the neighbourhood he never fails to sell, mostly to market gardeners, who have, many of them, better facilities for raising these plants if they would only do as he does — “firm” the seed after sowing. In light land this advice may be safely followed.

— THE CLOVER AND GRASS SEED CROPS OF 1879. — MESSRS. HURST & SON have just issued some notes respecting the Clover and Grass seed crops in the producing countries of Europe and America: and they intimate that their returns are based upon reliable information received from correspondents in each district. The crop of English red Clover, owing to the protracted rains of last summer, and the unusually late harvest, is *nil*. Not a single sample of new seed has put in an appearance as yet, but there remains on hand a large quantity of seed of 1879 crop, and this is fetching a considerable advance upon last year's prices. Cow-grass, or the commonly cultivated perennial Red Clover, shows but a small crop, and the few lots of yearling seed will soon become exhausted, and it is expected the supply will close before the season has far advanced. Of foreign red Clovers there are large crops, and in most instances they are unusually good. The smallest yield comes from France, and the average quality of the French seed is not good. Germany has a fair crop, of superior quality; the seeds from Central and Southern Germany are bold, but full of noxious weeds, and to sow them without machine cleaning would be to foul the land beyond measure; the most injurious weeds are those having small seeds, and they are therefore easily separated from the Clover. The United States and Canada furnish large crops of red Clover of the finest quality yet seen from those countries, and they will no doubt supply the largest proportion of the seed sown in this country next spring. The English crop of Trefoil is almost a failure, and though France shows a fair crop the summer rains so discoloured and injured the seeds that those of yearling growth will have to be relied on mainly. The finest samples of the English crop of 1879 are now realising high prices, and they are likely to hold their present values. The crops of white and Alsike Clovers are almost entirely confined this year to Germany, but reliable information as to the extent of the crops of each is not as yet forthcoming; the prices of white Clover are now exceedingly high, but as the great bulk of the seed is not threshed out until after the commencement of the new year, probable prices can only be hazarded at present. Alsike is at present cheaper than white Clover. Lucerne is both a small crop and of indifferent quality. Of Sainfoin there are hardly any English saved seeds, and the French crop not being

up to the average prices are high. In respect of Italian and perennial Rye grasses, the French crop of the former is not up to last year's, nor is the quality fine. There is no doubt a substantial rise will take place in the prices of the finest samples. The Irish crop is small and generally of inferior quality. Both the Irish and Scotch crops of perennial Rye-grasses are far below the average, and it is found dealers are preferring one year old seed to new. All samples of heavy weight are unusually high in price, and it is recommended these be purchased for sowing instead of the lighter seed, even if half the usual crop be sown, as the latter are of inferior quality. Natural grasses are mostly in good supply, and of fair average quality, the Continental harvest being superior to the home one. Timothy-grass has risen considerably in value, and as the consumption of this grass increases prices are likely to rule higher. The new crop of white Mustard is not a large one, and the quality the worst ever known, but there is a fair quantity of yearling seed of good character. Rape is a short crop, of inferior quality, and prices will no doubt advance with the season.

— FAILURES OF PLANTS IN FORECOURT GARDENS. — It must be stated these are formidable and, in the matter of the loss of choice plants, a distressing list. The wet weather of summer began the work of decay, and the hard frost and freezing winds of December completed the ruin. In very many cases it is the old tale of an unmanageable and unsuitable soil, the fertile earth removed and replaced by rubbish of the worst character for growing flowers, in which a stiff retentive clay forms a large part. Let it be trenched or dug, or covered with better soil, it comes to the surface, and makes all clammy and unyielding. The expense of remaking these gardens entirely is too heavy to be borne by many tenants, and if it were attempted to burn the clay so as to make it more friable and lighter, the act of doing so might become a nuisance to the neighbourhood. A good dressing of cinder-ashes will do something to render the stubborn soil lighter, and the addition of some good loam as a surface dressing — loam of a fibry character, if it can be obtained — will be of great service. It to this can be added the sand swept up from the roadside and leaf-mould, something will have been done towards obtaining a more tractable soil. When the subsoil is clayey, it is well in planting choice subjects to endeavour to secure some drainage for them, by placing brick rubble, or something of the kind, below them. Such a stubborn soil will not yield all at once, but in course of time it can be made much more serviceable than it has been in the past.

— THE RAINFALL AT PEASMARSH, HAWK-HURST, SUSSEX, DURING THE YEAR 1879. — Mr. G. WILLIAMS, gr. to CHAS. LIDDELL, Esq., of Peasmarsh Place, states that the rainfall at that period during 1879 was:—Jan., 3.54 inches; Feb., 4.50 inches; March, 0.97 inch; April, 3.33 inches; May, 3.38 inches; June, 4.04 inches; July, 3.42 inches; Aug., 4.02 inches; Sept., 2.81 inches; Oct., 1.48 inch; Nov., 0.84 inch; Dec., 1.28 inch — the total for the year being 33.61 inches. The number of days on which 0.01 inch of rain or more fell was 157. In 1878 the depth of rain that fell was 35.05 inches; and the number of days on which 0.01 inch or more rain fell was 147.

— SOWING GLADIOLUS SEED. — The pleasure experienced in raising and flowering seedlings is shown by many persons, and the subjects on which they try their hands are of a varied character. Looking through a garden last autumn we saw a fine lot of Gladioli which had been obtained from seed, and it was stated that by raising seedlings every year, the overflow of the plants, after the best have been selected, served for the decoration of shrubbery borders, &c. The plan adopted to raise seedlings ensures good bulbs to flower the second year. The seed is sown the first week in March, in deep pots filled with good soil to within a few inches or so of the top, the space being left to admit of some top-dressing being applied in the summer. The seed is sown thinly so as to have about twenty plants in each pot, 10-inch pots being preferred for the purpose, and they are placed in a slight heat to induce germination. After the plants are up, air is given, but the pots are kept as near the glass as possible, and then gradually hardened off, so that the plants can be stood out-of-doors in a warm and sheltered position about the end of May:

and here they remain in their seed-pots throughout the summer, being carefully looked after in the matter of watering, and about July top-dressed with some rich compost. About the first week in October the pots are lifted into a place of shelter from frost, where the plants ripen themselves off, water being withheld as the leaves turn brown; and when this results the bulbs are taken up, put into paper bags, and kept in a dry room till the first week in March, when they are planted out in a well-prepared bed, as in the case of blooming roots.

— LONDON CENTRAL FRUIT AND VEGETABLE MARKET. — The *Builder* of Saturday last contains the ground plan and elevation of the new market now being erected at the west end of the Central Poultry and Provision Market fronting the streets or roads — Farringdon Road, Charterhouse Street, western roadway, and a new road on the south side now being constructed running from the south-western corner of the Central Poultry Market to the foot of Snow Hill, at its junction with Farringdon Road. The general principle adopted in the arrangement or plan of the market has been to make the main floor as nearly as possible the level of the poultry market, so as to make the entire range of central markets, of which this will form the westernmost building, all readily approachable the one from the other. There being a difference of level of some 10 feet between the western and Farringdon Roads, the main entrances to the market area are placed — 1st, that on the east opposite the western entrance to the poultry market; 2d, that on the north, in Charterhouse Street, near the corner of the western roadway; and 3d, that on the south, in the southern roadway, in a corresponding position to that in Charterhouse Street. The floor of the market will be level, a slight gradient being necessary only at the several entrances. The plan of the market shows an area of nearly 44,000 feet, devoted to wholesale market purposes, surrounded by forty-one shops, fronting the four streets before mentioned, which can be used for retail or other purposes, and these occupy an area of 16,800 feet in addition. The general or market area is approached by three main or vehicular entrances, and by two further entrances for foot passengers from the Farringdon Road corners of Charterhouse Street and southern roadway. The market consists of a series of shops, thirty-three in number, having in front pitching stands for goods, and waggon stands, the whole approached by a roadway having a width of 18 feet always clear for vehicular traffic. In the middle of the market area is a further arrangement for pitching stands, and an area of about 4400 feet, including gangways. In roofing the market, the floor has been kept as clear and open as possible, the detached main roof supports or columns being sixteen in number, and the clear span of the roofs is 47 feet 6 inches and 56 feet respectively, with a centre octagonal cupola roof of 56 feet diameter. The roofs are of light construction, with a range of glass louvres at the plate and ridge levels, affording an ample amount of light and air, so requisite for a market of this character, but materially excluding the prejudicial glare of the sun. The height of the roofs generally will be 28 feet to the level of the plate, and to the ridge of the louvres 45 feet, the central roof rising to a height of 70 feet.

— PUBLICATIONS RECEIVED. — *Ireland and England*. By an M.P. A reprint from the January number of *Fraser's Magazine* (LONGMANS). — VICK'S *Floral Guide*.

— THE WEATHER. — General remarks on the weather during the week ending January 19, 1880, issued by the Meteorological Office, London: — The weather was fine generally in Ireland and Scotland; dull, gloomy, and misty over England until the 16th, when it became fine and bright there also. The temperature was again below the mean for the time of year in all districts; over the greater part of England the deficits ranged from 5 to 7°, and elsewhere from 3° to 4°. The thermometer was highest on the 16th, but subsequently fell quickly, the lowest of the minimum readings (13° at Shrewsbury) being registered on the 19th. The wind was variable between N.W. and N.E. during the first five days, but on the 18th a moderate easterly breeze set in over the greater part of the kingdom, and continued till the close of the period. The rainfall was again much less than the mean in all districts.

JAPANESE CONIFERS.—VI.

(Continued from vol. xii., p. 788.)

**PICEA** (*Abies*, Hort. Angl.) **AJANENSIS**, Fischer. — The history of this beautiful Spruce Fir, a native of North-east Asia and Japan, has become involved, owing to its having been confounded with two other nearly allied Spruces, one, *P. sitchensis* *alias* *P. Menziesii* of English gardens, a native of North-west America; the other, *Abies* or *Picea* *Alcockiana*, a native of Japan only, so far as we know. That there is a great similarity between them is no doubt true, but there are differences in the form and anatomical structure of the leaves, as well as in other points, which amply suffice to distinguish them for garden purposes.

At Combe Wood, and in other nurseries, under the name of *Alcockiana*, two or three different plants are grown, as we shall hereafter have occasion to mention. This has arisen from the fact that Mr. J. G. Veitch, who made known the plants to our gardens, was not himself able to collect seeds, the country not being then open to foreigners; consequently he had to depend on others, whose competence, or veracity, or both, might not have been trustworthy. In any case, it is clear the seeds got considerably mixed. Moreover, there is a discrepancy between the description of *A. Alcockiana* (J. G. Veitch in *litt. ex Gardener's Chronicle*, p. 23, 1861) and his type specimens, now before us. Mr. Veitch probably wrote from Japan, and had no opportunity of revising his manuscript; at any rate, the fact remains that in his description flat leaves are mentioned, while his type specimens have 4-sided leaves. We prefer to rely on the evidence of the type rather than of the description.

*P. ajanensis* is, according to our experience, the plant most frequently cultivated in English nurseries and gardens under the name of *Alcockiana*, but having examined type specimens of *ajanensis* and having, through the kindness of Messrs. Veitch, been enabled to study the authentic type of *Alcockiana* also, we are enabled to state that the two species named are quite distinct one from the other, unless the two forms be states of one and the same species, which in this case is very improbable, and indeed of which there is at present no evidence. Even if it were so, the name *ajanensis* would still have precedence of five or six years over Veitch's name of *Alcockiana*.

*P. ajanensis* (the *Alcockiana* of most nurseries) is an elegant Spruce Fir, with the general habit and appearance of the common Spruce, but with more refined elegant foliage, the leaves being flatter, shorter, dark green upon one surface, glaucous-blue on the other. The plant is doubtless variable, for the specimens in the nurseries vary very considerably in length and breadth of foliage and degree of glaucous hue, some being much more blue than others. All, however, have a peculiar disposition of the resin canals, as shown in the figure (fig. 22). In most species when these channels exist they are close to the under surface of the leaf, or free in the ground tissue, but in *P. ajanensis*, in all its forms (and we have examined scores of specimens living and dried), the resin canals are placed near the upper surface of the leaves, so that the green surface of the leaf appears to be marked by three ridges, the central ridge corresponding to the slightly prominent midrib, while the ridge on each side indicates the position of

the resin canal as seen more distinctly in transverse section under a low power of the microscope.

Habit.—That of the common Spruce, *P. excelsa*, but more elegant.

Shoots glabrous or villous when young, yellowish-brown marked with oblong, smooth, prominent cushions or pulvini, the upper free portions of which on the lateral shoots are more or less twisted and deflexed. The cushions of the leaves are rhomboid.

Leaves on the leader shoots appressed, the green surface anterior-inferior, that is away from the stem, the glaucous surface posterior-superior or next the stem, contrary to what happens in other Firs; those on the side shoots in many rows, but twisted at the base so as to be all in the same horizontal plane, and spreading horizontally from the branch at an angle of about 50°. Leaves on the upper surface of the branch appressed, parallel in direction to the branch, all flattish, linear-oblong, rather obtuse, thinner and rhomboid near the apex, not spine-tipped (or rarely spine-tipped?), thickened at the margins, midrib prominent on both surfaces, dark shining green, 3-ribbed, and with few stomata on the upper surface, glaucous and 1-ribbed beneath, with 4-6 lines of stomata on each side of the midrib. On transverse section the hypoderm cells are seen to be continuous, and in a double layer over the middle and edges. The palisade cells are sometimes well marked, in other specimens indistinctly so, but in any case the resin canals are placed above, not (as usually) below the palisade cells, and immediately beneath the green surface of the leaf.

Stamens:—Connective of anther according to the figure cited deflexed denticulate.

Cones of type specimens, erect, 1-2 by  $\frac{3}{4}$  inch, oblong, tapering to each end; scales, shining brown, oblong-ovate, undulate and erose on the free edge; bracts minute suborbicular; wing of seed ovate-oblong.

From the North-west American *P. sitchensis* (*alias* *Menziesii*) the present species differs in its

FIG. 22.—TRANSVERSE SECTION OF LEAF OF *P. AJANENSIS*, MAGN.

flatter, less deeply keeled and blunter leaves. In the leaves of the American species, moreover, there are usually no resin canals. Dr. Engelmann also informs us in a letter that the bracts of *ajanensis* are very minute, short, and oval, the scales being undulate, while in *P. Sitchensis* the bracts are stout lanceolate, about half as long as the oblong scarcely undulate scale.

From *P. Alcockiana* the leaves differ in their flattish, not 4-sided shape, the presence of palisade cells, while the cones differ from those of *P. Alcockiana* in their more oblong, erose, not semicircular sub-entire scales.

Murray, *Pines and Firs of Japan*, p. 68, has apparently described and figured the leaves of this plant under the head of *A. Alcockiana*.

**PICEA AJANENSIS** VAR. **MICROSPERMA**.—This, as appears from the evidence in the herbarium, is clearly only a variety of *P. ajanensis*, and is equally certainly the *Abies microsperma* of Lindley, and the *P. ajanensis* var. *japonica* of Maximowicz. The form and the internal structure of the leaves is the same as in the type. The cones measure 1  $\frac{1}{2}$  by  $\frac{3}{4}$  inch long, and in form are like those of the type, as also are the scales and seeds.

Whether Siebold's *P. jezoensis*, with its spine-tipped leaves, belongs to this species, or to this variety, or is specifically distinct, is at present uncertain. It seems to differ only in the spine-tipped leaves as far as is known at present. Some of the specimens of *microsperma*, however, have spine-tipped leaves; so the further information is wanted before the identity or otherwise can be decided. Meantime, for garden purposes, we here keep *ajanensis* with its blunt leaves distinct from *jezoensis* with

its spine-tipped leaves, though with a very strong impression that, specifically, they are not distinct. Both, moreover, grow in the Island of Yesso.

As a rough guide for garden purposes we give the following table, showing the distinctions between the three Japanese Spruces most often confounded:—

A. Leaves flattish; cone-scales oblong, erose, or lacerate.	1. <i>AJANENSIS</i> (including <i>ABIES MICROSPERMA</i> ).
Leaves acute, not spine-tipped.	
B. Leaves distinctly 4-sided.	2. <i>JEZOENSIS</i> .
Cone-scales rounded, nearly entire.	3. <i>ALCOCKIANA</i> (= <i>P. COLORATA</i> ).

The internal structure of the leaf in the two first is the same, and different from that in No. 3. *M. T. M.*

A TRAMP IN LINCOLNSHIRE: A PLEA FOR MARSHLAND.

INSTANCES of the reclamation of vast tracts of land, from a state of comparative inutility to that of great agricultural value, are nowhere more instructively presented than in the lowlands of Lincolnshire. Leaving the bold undulations of Lincolnshire, or Northamptonshire, strongly characterised by far-spreading woodlands, broad pastures, and stately mansions, and passing over the range of limestone hills which run through the upper part of Lincolnshire, forming in their development northwards the well known wolds of the county, we soon reach the long, low level track which constitutes the lowlands, and which have given valuable extension to the fertile area of this large and important county.

The change from an upland country of hill and dale, and frequent woodland, to an almost treeless plain, level as the ocean that bounds it on one side, is startling, and not over-pleasing to an unaccustomed visitor, who is apt to be affected by the monotony of a long journey through scenery the most noticeable features of which seem to be endlessly reproduced; but resting for a few days in the country we are much mistaken if the visitor's views will not greatly be modified, and he will discover that special pictures of interest, if not of beauty, are to be found even in low Lincolnshire.

There is a pleasure, to which few are insensible, in looking over an almost limitless extent of highly cultivated land, and seeing indications in the system pursued, and in the character of stock evidence of agricultural intelligence of a high order; and when the eye is carried far over the country and substantial farmhouses, well filled stackyards, and well built and comfortable cottages meet the view in endless repetition, one is apt to believe that some advantages belong to the pursuit of farming, and to regard with satisfaction this aspect of Fenland.

Is it not pleasant again to meet with instances where great natural obstacles have been successfully overcome? And in looking over the level plains we are continually reminded that, without the well-directed skill and energy and perseverance of intelligent and far-seeing men, this land would have remained a source of trouble and danger rather than profit to the country. Throughout the low country the drainage of the land has been the work of scientific engineers for ages past. The system embraces vast areas, all natural waterways are employed, and great arterial dykes traverse the land, into which the minor drains pour their collected waters; and it is strange to travel through a country where the roads and paths are bounded by deep dykes and the divisions of the fields are effected by the same means, and stranger still that, for agricultural purposes, much of this low land should be as dry and workable as any in the kingdom.

The advantages of unimpeded sunlight from earliest dawn until evening, when the last rays of the sun fall on the level landscape, are of no mean importance to a district; and the successful culture of several crops, and the maturation of Turnip, Mangel, and other seeds may be, in conjunction with the excellent land, ascribed to the fact that every ray of sunlight falls on the land. Dwellers in picturesque valleys, whose view of the sun is limited to a few hours at mid-day, may well envy the unobscured daylight that falls on the plains of Lincolnshire. But whatever may be thought by outsiders, the denizens of the low lands have learned the value and appreciate the advantages belonging to their district, and can well afford to laugh at the jokes, originating in the old time, and still levelled at them, regarding a

certain identity in complexion with eels, on which they (the fen-men) were popularly supposed principally to subsist.

We have been tempted to make what seemed to us very obvious remarks in passing through low Lincolnshire on our way to the coast; we will now without further preface proceed on our journey. Traversing a portion of the land of dykes and high cultivation, and passing the little town of Wainfleet, which is connected by a tidal stream with the sea, we followed the direction of the retiring waters, and crossing the river by a slough or lock, made our way to the mud-flats that extend along the shores of Boston Deep in the direction of that town, and at once entered on a scene as wild and dreary, and as opposite in aspect to those presented by the reclaimed land, within the massive embankment that guards it, as could well be conceived. It enables one to realise the changes which have been effected in the enclosed land. The sea, though prone to invade the land in one place somewhat capriciously, makes restitution in another. The mud and silt carried into the estuary by the Witham, and by the large arterial drains, is gradually being thrown up on its shores, and future ages may see smiling crops of corn on this vast far-spreading muddy shore. But waste and solitary as it appears at present, it should not be without some interest to a naturalist; such spots occasionally afford examples of our British flora not met with elsewhere; and in such savage and rarely-visited places we may expect to find instances of bird life (even the bittern has been met with) unusual in other localities. Equipped for each contingency, we sallied out into the marshes.

Above the low, but within reach of the full tides, we were soon amongst the curious vegetation, that seems half of the sea and half of the land, of which *Salicornia herbacea* is the representative plant; it seems the pioneer of its class of thirsty plants, and as the land is lifted up by new deposits it steadily advances seawards: very many acres are here covered with it. It is locally called samphire, and under this name is collected and pickled. Better sources of supply having been discovered, it is no longer burnt for barilla. Associated with it, and sometimes clinging to the hummocky lumps of soil amongst which it grows, is *Atriplex portulacoides*, a plant that seems well to hold its own and aid the work of holding up the silt. Carpetting the raised masses of hardened mud, and clinging to them and holding them together, is a tough little grass, *Glyceria procumbens*—a small thing to maintain its hold of the land against the pull of the sea. Beyond this fringe of vegetation is illimitable mud-flat, intersected with tortuous watercourses. Resting on the smooth mud seawards we could distinguish great flocks of stints, *Tringa minuta*, and knobs, *Tringa canulus*, which we endeavoured unsuccessfully to stalk. Thus collected, they are very wary, but in smaller clusters, feeding by the numerous rivulets of water, they were more easily approached, and thus we obtained the required specimens.

A few godwits and wild ducks were the only other birds to be found, but flocks of golden plover occasionally passed over the Deep. The absence of gulls seemed singular, until we remembered observing on our way through Marshland large flocks in nearly every arable field, and innumerable plovers in the pastures, replacing the rooks of the upland country. Retracing our steps, and making our way to the mouth of the Haver, we hailed a gunner just paddling his little punt along the stream, who, with a caution as to the crankiness of his small craft, took us across, landing us near his habitation—a vessel stranded on the muddy shore. We were glad to accept his invitation to rest awhile in his snug little home, gladdened by wife and children; and, after a pleasant talk about birds and seals and fish, we started for the sea-bank easterwards, crossing some flats awkwardly intersected with dykes, and covered with a growth of *Salicornia* intermixed with grass, reached the commencement of the sea-bank, called Gibraltar Point, thence travelling along the beach northwards we found a welcome change from the mud of the Haver to the firm clean sand of the sea-shore.

Sand-banks covered with tall waving grasses here form a bulwark against the sea, and extend along the coast as far as the eye can reach, rising from 15 to 20 feet in height. Without the assistance given by these wonderful grasses the heaped up sand-dunes would be as unstable and uncertain as water itself—the play

of the winds and waves; but bound together by their clasping roots the bank is held together, and forms a sufficient rampart against the waves. Associated with these grasses—*Elymus arenarius* and *Psamma arenaria*—is Sea Buckthorn (*Hippophaë rhamnoides*), which appears to have found a congenial position on the sandy hillsides and hollows; its thickly clustered orange-red berries give it an ornamental character at this season. Making our way through the thick grass covers our clothes became coated with the burrs of Hound's-tongue (*Cynoglossum officinale*), which, hardly distinguishable amongst the grasses, thus fixes its seeds for distribution; but the shore affording better footing than the irregular bank, we descended, and in doing so flushed a little party of snow buntings—recent arrivals from the far North; our old Scandinavian friend, the grey crow, frequently rises from the beach: trustful in his Norwegian home, he has already learned to be wary here. Springing from little sand-heaps at the foot of the bank we found several clusters of Sea Rocket (*Cakile maritima*): the firm sand was an absolute delight to walk on, and we could not but notice the wonderful way the sea has of assorting gravels and sands and silts in their various degrees of size on different portions of the shore; then the ripple-marks, like mimic seas, record the gentle play of the waves, just as the wreckage met with occasionally proved its mighty power. A walk of five miles along this coast brought us to the rising town of Skegness, where, under good auspices, houses are rising of the best construction; a public garden has been formed, a pier subscribed for, so that the place promises to be a second Trouville: and here we were glad to find a resting-place for the night, hoping to pursue our walk along the shore on the morrow. *W. Ingram, Belvoir.*

## DOUBLE PRIMULAS.

EVER since the year 1820, when, I believe, the original type of this plant was introduced into this country, there has been a growing liking for it and the numerous and beautiful progeny which has issued through various agencies from it. The variety in the single-flowered forms is great, and there are shades of colours whose number is almost legion. An enormous quantity is annually grown and disposed of, while at the same time there is evidently an increased appreciation, and consequently a large demand for it. The plants certainly possess merits which at once make them favourites. But however useful and ornamental the single-flowered kinds are, they are surpassed by the duplex forms. As a grower, without being infatuated or over-enthusiastic, I am bound to push this point, namely, that they are one of the most valuable of decorative plants the cultivator can bestow his pains upon. Their value for the decoration of the conservatory cannot be over-estimated.

There is one thing absolutely necessary in keeping them in good floral display during the winter, which is a dry atmosphere; in such they will keep perfectly healthy and free from damping, and will flower through the whole winter. Lowness of temperature need not prevent the cultivator from growing them, for my experience this season is charged with surprises in the case of these plants. In one house, where were my finest examples of *fimbriata* (double-flowered form) it happened most unfortunately that the boiler was wrong during the most severe night we had, and the result was that the balls of the plants were frozen, and the leafstalks broke like icicles. Of course, not having before witnessed such a state of things, I thought all was over with them, but let me say that at this moment there are on those same plants some of the finest flowers of that variety I ever saw. Strong *Pelargoniums* were quite killed by the side of the same plants, but they survived the ordeal without any apparent hurt.

The house in question had a very dry atmosphere, and the plants were not surfeited with water, which is most fatal to them, during the winter season especially. Judicious watering, like judicious training, results advantageously to the operator: this particularly holds good in the case of double *Primulas*. One of the most enthusiastic growers of these things holds to these facts. Their value for bouquet making, or for any floral decorative purpose, is not to be over-estimated. Unlike their single kindred the flowers are persistent, and much more durable even in a state of beauty. The demand for these flowers is enormous. I know no reason why they are not

more generally grown; it is true they are largely cultivated, but there is still ample room for their much more extended cultivation. The results they bring are certainly beyond those furnished by many other plants grown. Flowering as they do through all the dullest portion of the year should be in itself a sufficient attraction. No amateur with anything like a greenhouse need be without double *Primulas* in flower at Christmas. They commence to flower in good earnest during the late autumn months and continue till spring is fairly in, and would flower the whole year through if allowed, but I do not allow them to do so.

## PROPAGATION.

A few words as to their propagation and after-growth will suffice. Supposing the old plants are to be cut up every season—which is a practice I heartily commend—this may be done in spring by removing all the side-shoots with as much heel as possible, carefully cleaning the cuttings from all decaying matter, and inserting them in the smallest thumb-pots, in a compost of half fibrous loam finely prepared, and half sharp silver-sand, potting each cutting firmly, so that it is fast in the soil; if there is not sufficient heel to keep it so, secure the cutting by two or three small pieces of wood. Plunge the pots in a bottom temperature of about 65° or 70°, or stand them under a handlight in a house with that temperature, keeping them well shaded during sunshine, and giving air during early morning, with the soil moderately damp.

With this treatment a good percentage of the cuttings will soon root, when they may be removed to a house with a temperature of 60° or 65°, standing if possible upon a cool bottom. If when the old plants are being cut up, some shoots are found with roots upon them, which is sure to be the case if the plants have been previously treated as they should be, in potting matters they should be potted in small pots and kept close a few days, when they will speedily establish themselves. The remaining shoot, which is left after the rest are removed, I shake out and pot in a small pot, and grow on with the rest. Some growers keep the plants more than one year, when by that time the shoots are rather lengthened, and in the summer they fill the pot well up with gritty soil, and by the following spring the shoots have become rooted, when they are simply cut through, and with the roots are potted. But I prefer the former practice as better plants are produced and finer flowers, and a larger stock may be obtained in a given space of time, which is a consideration in many instances.

## POTTING.

After the small pots are filled with roots we shift them on into "fifty-four" pots, using as soil two parts good fibrous yellow loam, one part leaf-soil, and one part well-matured cow manure, with a good supply of sharp sand; good road sand is much better than silver-sand. Pot the plants firmly and well down, quite to the base of the leaf-stalks, otherwise in a short time the plants will become very loose, when they are very liable to be broken off. Place them in the same temperature, keeping them shaded from direct sunlight, which none of the *Primula* family enjoy, and water carefully but sufficiently. To allow them to become dry is most injurious in their growing stages. By the end of June they should be removed to a cold pit, in a shady position; if that is not at hand, artificial shading must be given them during all sunshine, and they are best placed on other inverted pots, so as to place them nearer the glass, and allow a free current of air between them, which is a sure preventive of damp and a promoter of strong and healthy growth.

Always ventilate by tilting the front portion of the lights, and they may have good ventilation night and day after they have been in the pit about a fortnight, which will suffice to harden them off a bit. The 54-pots will soon be filled with roots, and they must be shifted on into larger ones, say 7 or even 8-inch pots; 32-sized pots are very convenient, and, as a rule, are large enough for convenience, and good plants may be grown in that size. In this potting, as well as all previous ones, good drainage is an absolute necessity to ensure success. The same soil may be employed, potting firmly and placing the plants well down, after which all that remains to be done is to give them careful waterings and ventilation, remov-

ing any decaying leaves when necessary, and watch them make wonderful progress. After the pots are well filled with roots and the plants in good healthy action, occasional waterings with weak manure-water will be beneficial to them. They may remain in the pit until the end of September, when they should be removed to the house intended to winter them in, which should not have a temperature of more than 55° at night. If they are stood upon a bed they are best on other inverted pots, so as to have a free circulation of air and nearness to the glass. Never syringe or sprinkle water on the foliage, or dampness will be the result. Wooden stages with spaces between the bars suit them well during the winter, as that ensures dryness.

The selection of varieties must depend upon the taste of the cultivator, and, of course, upon the means at hand. There are now so many excellent kinds to be secured that there is no difficulty to get suited. Certain of our plant producers make them a speciality, while the majority of them are possessors of some kinds.

I select some of the best kinds extant, all of which I know to be worth cultivating:—

WHITE AND BLUSH FLOWERED VARIETIES.

The old kind known as *alba plena* is well worth growing but it is far surpassed by *fimbriata*, which produces much larger flowers, very double, and finely fimbriated; this is an excellent variety for cutting purposes. *Candidissima* is a robust-growing kind, with large full flowers of the purest white, and very durable. *Water Nymph*, a new kind, belongs to the Fern-leaved section, and has large double white flowers, nicely fringed. *Empress* is also a lovely Fern-leaved variety, the trusses are large, producing numerous large very double flowers, exquisitely fringed. *Princess of Wales* is certainly unrivalled; the flowers are very full, of great substance, copiously fringed, pure white. I regard this as the best of all the white-flowered series. *Blushing Beauty* is a very strong-growing kind, marvellously floriferous; flowers immense, finely fringed, white suffused with rose, grown for bouquets. *Miss Eyre Crabbe* produces large trusses bearing large double white flowers, slightly striped or blotched with red. *Exquisite* produces white flowers sweetly flushed with rose; it is of close growth, most easily grown, and very free flowering.

RED AND CRIMSON FLOWERED VARIETIES.

The old double red known as *rubra-plena* is well worth growing; the flowers are deep rosy-red fading to purplish-rose, very free, and of good constitution. *Atro-rosea plena* is a very superior form with velvety crimson flowers, very large, and full-petalled—a charming kind for cutting. *Emperor*: this is a grand associate for *Empress* in the other class, producing rich crimson flowers, with Fern-like foliage; the flowers are very double and most lovely. *Miss Eva Fish* is a novel flower; it is very full, produced in large trusses setting well above the foliage, of a rosy-lilac colour, passing to blush, with a good white margin; a very fine variety. *Magnifica* is a strong growing kind, bearing very large and full flowers of a rich magenta colour finely fimbriated. *King of the Purples* produces enormous flowers, very full, of a rich purple colour, assuming a very deep tinge as it is passing off; a most attractive variety, of free and vigorous growth. *Rubra grandiflora* is a very useful kind; the flowers are rich crimson, very full, and of good substance combined with a strong constitution and a first-rate habit.

There are several other kinds known in our plant collections which possess equal merits in certain details, but, viewing them from all stand-points, the above are the best and the most generally useful. Before concluding I would add, an impetus to amateur friends, that seed of double-flowered varieties can now be easily procured from good seedsmen, which give a very fair percentage of good flowers, some of which have proved to be distinct and quite equal to many of the named kinds. If the seeds are treated in the way recommended for the single-flowered kinds, they will readily germinate, and their after-treatment may be similar to that described for the cuttings above, encouraging the plants to as much good growth as possible, so as to ensure good flowers in the following autumn after being sown in the spring. The merits can easily be judged when compared with the already existing forms; if they are much inferior, they must make room for other better things, by being consigned to the waste-heap. A.

Home Correspondence.

**Standard Ivies.**—To any one requiring plants of a somewhat formal character for architectural flower gardens and terraces in exposed situations or near the seacoast, I would strongly recommend standard Ivies. I consider them far preferable to Sweet Bays, Laurustinus, and plants generally used for such purposes, because they are so hardy that once in position they may be left to take care of themselves, as they defy storms of every description with impunity. Here there are between twenty and thirty planted in various positions, which appear to awake a considerable amount of interest amongst visitors. The stems are about 5 feet high and 18 inches in circumference, and are comparatively as straight as a gun-barrel. The heads average 4 feet through. Last year some of them had become too large, consequently we cut them hard in, which almost deprived them of foliage, but in six weeks they were quite green and bore no appearance of having been so recently reduced. Periodically, knife in hand, we go over them and take out all points and straggling shoots, which we generally find sufficient to keep them sizable and in good order. *A. L. H., Lancashire.*

**Free Bearing Apples.**—Bad as the season was last year for fruit generally, and thin as most kinds of Apples were in districts that are not exceptionally favoured, trees of Lord Suffield and Keswick Codlin could be seen bearing heavy crops, and it is very remarkable that these two varieties seldom or never fail, even after the worst of springs. Why they should escape frost and set their blooms when others are cut off I am unable to say, but that they generally do so is nevertheless a fact, and it is surprising that this immunity does not make them more sought after among growers, especially those who send their produce to market, as the above-named sorts are in and fit for cooking long before any others are ready. Not only are they marvellously free bearers, but they are excellent culinary kinds, and highly prized in kitchens for sauce, as they are very soft and pulpy, and can therefore be beaten up smooth. Besides being so valuable for cooking, Lord Suffield is not bad for dessert when fully ripe, and being large and handsome it makes a showy dish on the table, where it is quite an acquisition in helping to make a display at a time when other fruit is scarce. In addition to being good croppers, they are excellent doers, and will grow in almost any kind of soil, but like most Apples they succeed best in that which is of a deep loamy nature. *J. S.*

**The Champion Potato.**—At p. 52, Mr. Greaves has pointed out an error or two made by me at p. 964 in your last volume; the error as regards the distance between row and row I cannot satisfy myself was mine at all. So far as I can recollect, at the planting time Mr. Greaves asked me what distance I thought the dealer wanted to put the Potatos between row and row, and from what I remember I said perhaps 3 feet, and he replied "Nay, four." I thought no more about the distance until I went to see the Potatos taken up, and in jumping from ridge to ridge, without measuring, I fixed on the 4 feet without thinking any more about it; no doubt many of the rows were 4 feet although not intended to be so, in many places, at least I thought so. The next error is the bulk, which Mr. Greaves must have thought was going to be something wonderful, for he invited me several times as the crop progressed, but I had no opportunity of going to see them until Mr. Greaves sent to say they were being taken up. I inspected the ridges with Mr. Greaves; we next went to those that were being ploughed out, and Mr. Greaves was careful to find the last Potato, to show how many there were at a root, and as I said in my last communication they were packed as only Nature could pack them. The ridges were full of Potatos. We next inspected the heap: a third or nearly was in the heap, which was a grand sight. Here Mr. Greaves said he had weighed the Potatoes from so many roots, and had come to the conclusion that the crops weighed seven and a half tons to the acre. I made the remark that they appeared more like ten tons, to this Mr. Greaves made no demur. This conversation was repeated over and over without a word of dissent. I put more faith in his judgment than I did in my own, as he was more accustomed to see heaps of Potatos than I was. Therefore, if there was a mistake, Mr. Greaves was a consenting party

to that mistake. For my own part, I had no interest in writing a false statement. I like to see a bit of good cultivation, and this was grand in every way. The letters I have received on this subject will show that the whole has been appreciated; and to finish this, I ask your readers to believe that especial means were used, and that with a wise mixture of manure a wonderful crop was the result. *William Culverwell, Thorpe Ferron, North Yorkshire.*

**Effects of Bitter-Sweet on Animals.**—The effect of Bitter-Sweet (*Solanum Dulcamara*) on animals, when experiments have been made, is first great sickness followed by lethargic drowsiness. A dog, it is said, will swallow sixty berries without any very appreciable result. *Helen Watney.*

**What is a Measure?**—In the west of Cheshire fruit and nearly everything else is sold by the measure. Every one agrees that a measure means a particular number of pounds weight, but that number appears to be indefinite and variable. I am told that a measure of Plums or Apples means 60 lb. weight, and a measure of Potatos 90 lb. weight. As for corn, it seems to me that a measure may be defined to mean "as much as the seller will give, and as little as the buyer will take for a particular sum," for I have at different times received as a measure of Oats 40 lb., 50 lb., and 56 lb. I live halfway between Chester and Whitchurch, and have been told that a Chester measure of corn is 40 lb., and a Whitchurch measure 50 lb., and a legal measure 56 lb. But if all is done by weight, why should the term "measure" be retained in these dealings, as it only serves to puzzle strangers? *C. W. Dod, Edge Hill, Malpas.* [Some day the Weights and Measures Act will—act. Eds.]

**Cool Orchids.**—Being an ardent lover of Orchids, whether hot, warm, cool, or cold, I was much interested by accounts in some of your contemporaries of a collection in Scotland, where the East Indian-house is an agreeable lounge for gentlemen, and the other Orchids are grown in proportionately airy and frigid atmospheres. Having never tried the experiment of cultivating natives of some of the hottest places on earth in a house apparently admirably suited for the coolest "children of the mist," the very nebulous and nubigene of *Odontoglossum* and *Oncids*, I can but wonder and admire; but with regard to what must be an exceptionally cool treatment of so-called cool Orchids, my experience points in a diametrically contrary direction. For some years the coolest house here was kept at a temperature varying from 45° maximum to 35° minimum, during which time the plants were on the whole healthy indeed, but produced from year to year bulbs of the same size as the last, with a regularity truly monotonous, varied occasionally on the diminuendo, but seldom if ever on the crescendo scale. So that there seemed but small chance of any one, were he even to reach the age of old Methusaleh, ever seeing them attain to the dignity of respectable plants. Under a new régime *nous avons changé tout cela.* With the temperature ranging from 10° to 12° higher a striking improvement soon showed itself, and in this, the third year it has been tried, the *Odontoglossum*, *Alexandre* especially, with hardly any exceptions, are making bulbs at least one fourth larger than those of last year, and are producing spikes with from twelve to twenty flowers. Nor do *O. macranthum*, *O. Pescatorei* and others, *Masdevallias*, &c., resent a higher temperature, as their increasing bulbs, and, in the case of *O. macranthum*, flower-spikes 12 to 14 feet long, sufficiently attest. The writer of one of the letters referred to gives one piece of excellent advice: "Let not the grower whose treatment is succeeding well be in any hurry to change it," and he might very well have added this caution, "lest in doing so he should discover some facts, doubtless highly interesting, but not altogether satisfactory to himself, about cool Orchids and how to kill them." *Philorchis.*

**Sheep Poisoned by Nightshade Berries.**—In reply to the Rev. C. Wolly Dod's queries respecting the above, and the editorial note on the same, all I can say is that the death of the sheep referred to occurred some years ago, and as the flock were all healthy and well previous to being turned into the field, and they were found browsing on the hedgerow where they had eaten the greater portion of the plants of *Solanum Dulcamara* with which the banks abounded, and which was found in their stomachs with nothing else but the Turnips, no other conclusion could be arrived at but that they were poisoned, which was further confirmed by the immediate removal of the remainder, when no more were lost. That the berries are poisonous to animals there can be no doubt, and I find it stated in *Miller's Botanical Dictionary* that thirty killed a dog in three hours, and according to Withering, a once celebrated English botanist, the general properties of *Solanum Dulcamara* and *Atropa Belladonna* are much the same. It appears that the use of the former medicinally in large doses produces violent sickness, with headache, giddiness, drowsiness, and

other dangerous symptoms, and that it has to be administered with great caution. Turning to Paxton I find it there remarked that *S. nigrum* and some others are highly virulent poisons, and in face of such testimony it appears very imprudent to turn cattle into fields where they are. *J. S.*

**Pescatorea Klabochozum**, Rehb. f.—A glorious flower of this has just come to hand from Messrs. Backhouse. The colours are nearly as warm as in the best variety of *P. Dayana*, which are so charming. The white is as shining as in the finest dish of Devonshire cream. The purple colour begins to turn to mauve. The styliform processes and warts of the lip are of the colour of dark cherries, while the keels of the callus are almost black. Since this is the first flower the plant has developed, I entertain a certain hope, founded on what I have observed in *Pescatoreas*, that Messrs. Backhouse may by-and-by get some giant flowers from this plant, like the typical specimen in my herbarium. I should like to show it to those sneering Orchidists, who are suspicious that I praise hideous things; but if they do not see the evidence, why do they say so? Is there no individuality? Just now I have a very useful lesson to give to the great followers of Saint Thomas. My late good friend Francis Klabocho, who has joined that glorious army of martyrs for horticulture and botany, brought a very good *Pescatorea* plant to Hamburgh, which he believed to be *P. Dayana*, thinking that the single *Pescatorea Klabochozum* (whose flower is my typical herbarium flower) was in the hands of Messrs. Veitch. We were pleased to have *P. Dayana* a standard plant, both on account of its own merits as for its glorious name. Herr Ulrich Donat, our zealous and enthusiastic Orchid grower, was made very happy in a comparatively short time, by the sight of a bud, which grew, and finally expanded as a Christmas-box. It was *Pescatorea Klabochozum* itself! Now, in lieu of having the extent and the glorious colours of Messrs. Backhouse's specimen, it was much smaller, and replaced the purple, coming near mauve by a certain colour that has a frightful resemblance to that of the bricks of old English buildings. What a *lettre à cheval* should I have obtained from one of my dear English correspondents, if he had flowered such a *cretin* in lieu of the genuine *Adonis*? *H. G. Rehb. f.*

**The Thuja (Arbor-vitæ)** (see Enquiry, p. 90).—This is not considered poisonous in America. It is a very aromatic shrub, and its leaves are beneficial in rheumatism. I have heard that the American preparation called "Bay Rum," a most delicious wash for the hair, is made from their foliage. *Helen Watney.*

—I can say from experience that cattle and horses are very fond of it, and will destroy any hedge or specimens that they can get near, providing they are not kept out of reach by means of a fence. I never saw any ill effect caused by their browsing upon them. *Jack Sharp, Rochester.*

**Improved Potatos.**—I think I may claim to be entitled to speak as an "experimentalist" (see p. 81) with the Potato. If so, and in answer to "a Fav, &c.," allow me to say that when a Potato has been given sufficient time, say five years from its seed-berry, to become established in type, no after "selection" from the tubers will ever create the slightest difference. Selection *ad nauseam* must be given to every batch of new seedlings for fully the above period before an election of them can be made and a guarantee for commerce; after that their failure or success must depend upon their constitution, as no after-selection will ever alter their types one way or the other. Soil may refine or add grossness to the stock, but no human agency will alter their types unless, perchance, by sowing the seed from the natural berry, or grafting, or cross-hybridisation be resorted to. This is my experience, and it has been gained during near upon half a century. When I am tempted to give advice for furthering the progress and improvement of the Potato, I say do so by hybridisation, and aim at selecting those seedlings only which show signs of earliness and which are comparatively proof against disease. I lost quite ten years when I began beating about the bush for Potato improvements by natural selection from the tubers; but select as I would, and after all the care that I could give them, they would remain kidney and round in type, with all their other distinguishing peculiarities, to the end of the chapter. Natural seedlings from the berry added quite another cycle to my enterprise, with no result for improvement. Then cross-hybridisation and the grafting process for fully twenty-five years more, through the horticultural press and at the exhibition tables at South Kensington, &c., have given full evidence of what I could achieve in those ways; and cross-hybridisation has decidedly won, and no doubt will win more and more for those who are coming after me, though, should I be spared a few years more, I hope, even so far as I am concerned, to prove one great means of freeing the public from the fear of the Potato disease. Of course our large seed firms

have to take great precautions to keep their strains pure, and herein lies the great difficulty. What is a strain? Out of the batch of seedlings I raised between the Old Ashleaf and Turner's Union Round, were three of that strain which I sent to the Royal Horticultural Society's (Chiswick) trials of Potatos. I provisionally named them Eliza, John, and James Fenn; they were so nearly alike in type, that the committee decided to mix them up as one, and certificated and christened it Fenn's Early Market. Nevertheless, I kept them separate, with the result that Eliza and John proved to have no constitution, but James remains with me as Fenn's Early Market, vigorous of the strain. The stock was sent out to the public, however, mixed, as decided upon at Chiswick, and I believe the result has proved the same as the mixed strains would with me had I allowed them to do so—bad for reputation. Exactly so with Ashleafs, &c.; there are strains and strains, the types and constitutions of which being "set," will always remain true for the eye of judgment, and care, and commerce. *Robt. Fenn, Sulhamstead Abbots, Berks, January 20.*

**Scutellaria Mociniana.**—Of the many species of *Scutellaria*, *S. Mociniana* is by far the best and most brilliant, and when well managed is one of the showiest and most useful of stove plants, as it is just of that size and character that renders it specially adapted for general decorative purposes, and being sufficiently hardy to stand in a greenhouse or conservatory during the autumn, it is doubly valuable on that account, and deserving of being largely grown for the embellishment of those structures. Its habit of flowering is so profuse that even the smallest specimens of it in 4 or 6-inch pots carry large heads of bloom, as every shoot and lateral branch they form is crowded with rich clusters of blossoms, which, with their combination of bright scarlet and yellow colours, have a most striking effect. If kept free from insects this *Scutellaria* is of very easy culture, but unfortunately it is remarkably subject to red-spider, and unless grown in a moist atmosphere, it is a difficult matter to keep these pests under. If allowed to become established, these soon cripple and disfigure the leaves to such an extent as to cause them to drop. The best way of treating the plants in summer is to give them a small frame to themselves, as then they can receive special treatment by being heavily syringed overhead and shut up early—a mode of management that just suits soft-wooded subjects like this. If plunged near the glass, so as to get plenty of light, the shoots come very short-jointed, and stiff enough to support the numerous heads of bloom without any tying. Cuttings put in now, or any time within a month or so, will make first-class stuff, and are generally better than old plants kept over and pruned back; but if any of extra size are wanted, they may be had by growing these later on, and pinching the ends instead of cutting them in the usual manner before giving them a fresh start. Although *Scutellaria Mociniana* will do in almost any soil, it succeeds best in peat or a mixture of this and loam, or the latter and leaf-mould, to which some sand should be added to keep them open and porous. For ordinary furnishing purposes it will be found that 6-inch pots are quite large enough for the plants, which only grow about 1½ foot high, and bushy in proportion, and such as these when in flower are charming ornaments in windows or any other position. *J. S.*

**Seed Sowing.**—The remarks on seed sowing in last week's *Gardeners' Chronicle* are most opportune, and deserve special notice during this critical season, and every means should be used to diffuse this wise caution to all who expect to reap a crop from the seeds they sow. The season of 1879 having failed to ripen a great portion of the seed crops, and the small portion that was saved being very late and damaged by rain, required a long time to dry and get into condition, indeed many sorts were not safely housed until two or three months after the usual time, consequently new seeds are weaker than usual, and certainly will not thrive if sown too early, or before the land is in condition. The anxiety of gardeners generally, and especially those who provide for markets, to get the earliest produce, naturally drives them to sow before the proper season (the result is too often a failure, causing them considerable loss), yet I cannot trace during the last twenty years any advantage in sowing too early, and reports from various growers seem to prove that early Peas (for instance) sown in the middle of February are generally gathered as soon as the same sort sown in December or January, and avoid the risks to which the early sown ones are liable. Winkled Peas should not be sown till March. *Seedsman.*

**Soot on Boilers.**—One of your correspondents states at p. 55:—"On breaking up Weeks' boiler I found the tubes coated on the outside with about half an inch of soot, which, being a non-conductor, must have caused a great loss of heat." Again, another

correspondent says, also on p. 55:—"Everybody knows how much quicker a kettle with a clean bottom will boil than a foul one." Permit me to ask if these statements are consistent with sound logic? Would it not have been more correct to have said:—"Soot, a good absorber of heat, being in contact with the boiler or kettle, both good conductors, the heat, freely absorbed by the soot, was freely conducted to the water." In short, will not the water in a kettle with a foul bottom boil quicker than if the bottom be clean?—and more quickly still if the top and those parts not exposed to the fire be kept clean and bright? To some these may seem useless questions, yet in practice they often make all the difference between economy and waste. *T. Challis.*

**Rainfall at Greenlands, Henley-on-Thames, in 1879.**—The following is a monthly account of the rainfall here last year:—Jan., 3.48 inches; Feb., 3.56 inches; March, 0.71 inch; April, 3.31 inches; May, 2.92 inches; June, 4.27 inches; July, 4.15 inches; Aug., 7.43 inches; Sept., 2.54 inches; Oct., 1.17 inch; Nov., 0.11 inch; Dec., 0.79 inch. Total, 34.44 inches. From the foregoing it will be seen that August was our wettest month, no less than nearly 7½ inches having fallen; and the greatest fall in twenty-four hours, 2½ inches, was registered on the morning of the 3d of that month. In 1877, the total fall was 30.77 inches; and in 1878, 26.51 inches. *W. H. G., Greenlands, Henley-on-Thames, Oxon.*

**Brussels Sprouts.**—It may interest Mr. Fish to know that there are some of these good in the country; ours, although not up to their usual standard of excellence, which is doubtless owing to the past wet cold season, are nevertheless good. The plants, unlike your correspondent's, are dwarfer than we have previously had them, but carry with few exceptions such well developed sprouts that we find no difficulty in keeping up the usual full supply for the dining-room table. The seed was sown in a similar manner to that described by Mr. Fish, viz., in a gentle hotbed early in February, and the plants were pricked out in a cold frame, and carefully hardened previous to planting them out into well prepared quarters. The varieties, the Imported and Scrymgeour's Giant, have done equally well, and were obtained from the Messrs. Veitch of Chelsea. With the exception of Savoys and Snow's Broccoli—the latter were planted in a rather unfavourable situation, especially as the weather proved so adverse to their well-doing—all the Brassica family have done fairly well with us, indeed more than one horticultural traveller has told me that, taken as a whole, they are the best crops of the kind they have seen this season, yet they are not so good as usual. When in Surrey a short time since I noticed crops of Broccoli totally destroyed by frost, and I hear complaints from other districts. So far this winter we have been fortunate enough to escape without injury, but we are threatened at the present time, having had 19° of frost this morning, which is more than we have hitherto registered this winter. *Thos. Coomber, Hendre Gardens, January 20.*

**Poinsettia pulcherrima plenissima.**—A short time since I noticed some remarks in your columns respecting heads of bloom of these beautiful winter-flowering plants, measuring 13 inches in diameter. This morning I saw at Rouge Bouillon House, the residence of Charles Godfray, Esq., heads of both the double and single varieties, which measured nearly 15 inches in diameter, and of the most brilliant colour. I thought them so beautiful, especially the double variety (the centre of which was fairly filled up with its crimson leaflets, the central ones being erect, and forming a splendid head of bloom), as to be worthy of being placed on record. *C. B. S., Jersey.*

**Pinks.**—Since the advent of perpetual Carnations they appear to have risen in such favour for pot culture as to have quite taken the place of Pinks; but, useful as they are for winter flowering, the latter are far more beautiful, the markings of some of the best of them being simply exquisite, and the blooms of that perfect form and character as to leave nothing to be desired. Besides the richly faced varieties, there are several selfs, one of the best of which is Lee's coccinea, a remarkably bright floriferous-habited variety, and one that is very valuable for cutting. Another equally desirable kind is Lady Blanche, which is equally free, and, being of a pure white colour, is of great use for working up in bouquets. Among the marked varieties, Clark's Derby Day is the most perfect, the flowers being large and full, with heavy lacing of bright red. Lord Lyons, too, by the same raiser, is a very beautiful kind, but rather too late in blooming for pot culture, and yet it is one that expands well without bursting, and a variety that no one can fail to admire. For forcing purposes, the old Anne Boleyn is yet unsurpassed, and to have these good the cuttings should be put in early, and the plants got well established in pots

before winter sets in. "Grass," or young shoots from Pinks, always strike best after having made a little growth in gentle heat, when, taken off clean close to a joint, and inserted in sandy soil under a bell or in a propagating-box, scarcely one in a hundred will fail. Managed in this way, and grown, they will be found to succeed the perpetual Carnations, and when they have done flowering they come in admirably for filling gaps in borders, where during the summer they form fine tufts that make a grand display the year after. *J. S.*

**Fielder's White Azalea** (see Enquiry, p. 59).—This old variety is still the best white Azalea we have for early work, but it is in danger of getting into disuse, from what cause is not easily seen, except that it is old-fashioned. When I used to visit the Luxembourg Gardens at Paris some years ago, M. Rivière, the late *jardinier-en-chef* there, pointed out to me some hundreds of this white Azalea (I think he told me had nearly a thousand), that he brought on to flower early for the decoration of the Hôtel de Ville de Paris—so much was it valued on festive or great occasions at this once famous municipal building. They were grown *au naturel*, like the hardy Ghent varieties; crooked and straight and tall and slim, were all alike used and grouped in the decoration of this place and at the Luxembourg Palace; in this way they were subjected to little or no culture, but simply potted biennially or triennially as was thought desirable, and as may be supposed gave little trouble in summer beyond watering occasionally, for they were plunged out-of-doors in beds of decomposed leaves or dung, after a little recovery from the effects of decoration. Apart from its purity as a white flowering plant, it is moreover a free flowering plant, easily grown and giving little or no trouble. The flowers when cut last a long time in beauty, but to send to a distance they are better cut just before opening. I mention the Luxembourg Gardens specially, where it was extensively used, but in all gardens of note in France it was equally prized. *Henry Knight, Floors.*

**Select Vegetables.**—Out of a number of excellent kinds of vegetables we grow here annually, there are a few which I look upon as special favourites—standard first-class varieties. Viek's Criterion Tomato is one which outstrips all other sorts hitherto grown here, both in quality and quantity of produce. Dickson, Brown & Tait's Eclipse Cauliflower is another of superior merit, having all the superior characteristics of Veitch's, but dwarfer and harder than that popular variety. Stuart, Mein & Allan's No 1 Cabbage, which in reality is a high selection of Enfield Market, is the earliest Cabbage, as in some seasons it has been cut in February, and is by far the best for general purposes—in fact, I grow no other. I have formed a very high opinion also of the old Lemon Kidney Potato. The few I grew of it last year determines me to grow it extensively this year; compared with the old Ashleaf and Gloucestershire Kidney, it was much less diseased: it is a heavy cropper, and superior in flavour. Hammersmith Hardy Lettuce cannot be too highly recommended for standing the winter, and coming in early at this season. William the First Pea is decidedly the best early Pea grown, and is moreover a good cropper, and the right medium size for the cook. Leicester Red Celery maintains its superiority both for general excellence and its characteristic hardiness. *K., Trocside.*

**Adiantum fulvum.**—I wish to call the attention of Fern cultivators to the fact that the plant invariably, so far as my own observations have gone, grown as *Adiantum fulvum*, and figured as such by Lowe, is not *A. fulvum* of Raoul, and consequently of Hooker's *Sp. Filicum*, the *Synopsis Filicum*, &c. It had long struck me as singular that a plant so closely resembling *A. hispidulum*, especially in its pedate habit, should (supposing it to be correctly named) be placed, not in the "pedatum" group of the *Synopsis*, but in a quite remote section of the genus. I therefore took the opportunity of a visit to Kew herbarium to consult Mr. J. G. Baker and to compare fronds of the so-called *fulvum* with the specimens in the herbarium. The result was to satisfy both Mr. Baker and myself that *A. fulvum* of Lowe and gardeners generally is only a variety of *A. hispidulum*, from which it differs mainly in having shorter and rounder pinnules, a somewhat stiffer habit, and the young fronds of a tawny colour, from which latter character no doubt the specific name has been erroneously given to it. The true *A. fulvum* (Raoul), on the other hand, so closely resembles *A. affine* (Willd.) = Cunninghami (Hooker), that in the opinion of Sir Joseph Hooker (*Flora of New Zealand*) it cannot be satisfactorily separated from it. Mr. Baker, in a letter he was good enough to write me on the subject, defines *fulvum* "as differing from *hispidulum* by showing no tendency to a pedate mode of branching, by its less hairy pinnules, larger, less closely placed segments, and larger involucre." He adds that it is desirable that

cultivators should look at their specimens, to see if any of the *fulvum* in the country is the right thing, and that he will be glad to compare any specimens sent in with the type. If I may venture to express an opinion on the subject, having made a special study of the genus *Adiantum*, I would suggest that *A. fulvum* (Raoul) be merged as a mere variety in *A. affine* (Willd.), and that the species now so generally known to gardeners as *fulvum* retain that name as a variety of *hispidulum*. *Alfred O. Walker.*

**The Bees Again.**—Early Peach-house in full general blossom, and many advanced sets of nearly the size of Peas. The blossom is exceptionally strong, notwithstanding the sunless spring, summer, and autumn of last year. Bees for the fifth year steadily and joyously at work. It may be interesting to some of your readers to know that the hive which made the campaign of the Peach-houses last winter, and spring was though rather late, the first hive in our apiary to swarm. *Wm. Miller, Combe Abbey Gardens, Jan. 17.*

**The "Acme" Labels.**—Messrs. Stevens & Pinches, 48, Leicester Square, and 27, Oxendon Street, have registered and introduced a new label, which they call the "Acme," and for which they

FIG. 23.—THE "ACME" ROSE LABEL.

claim the advantages of durability, distinctness, lightness, and neatness. A sample before us enables us to say that they have not overrated the merits of the "Acme" labels, which are made of stoutish zinc, with the name embossed, and they appear to be practically everlasting. Fig. 23 is a fac-simile in size and style of the Rose label; and fig. 24 of the one designed for fruit trees; while another in the T form is manufactured for Orchids and all plants grown in pots and

FIG. 24.—THE "ACME" FRUIT TREE LABEL.

borders. They are very cheap—the Rose label, for instance, costing 1s. 3d. per dozen; and we should add that a large selection are kept in stock.

**Clover and Rib-grass.**—A customer of mine maintains that the Rib-grass found in samples of red Clover are not grown with the crop. I have seldom seen a sample of red Clover seed without some Rib seed in it. I find it in American, German, and French reds, and I have seen samples grown by farmers in Herefordshire containing nearly a fourth of Rib-grass. My customer maintains that Rib-grass comes into seed much earlier than Clover, consequently the Rib found in red Clover samples is put into the bulk by the dealers. The latter assertion I strongly deny, as we have been to a large expense in getting sieves and machines to try and take the Rib-grass out of red Clover samples. Would you kindly give us your opinion? *W. C.* [Unless the percentage of Rib-grass is very large, we should not think it likely that any seed-man would adulterate his Clover with it. *Eds.*]

**Poor Soil** (see Enquiry, p. 87).—I notice in your issue of the 17th "Working Sands" enquiry as to "the best way of treating a neglected estate with gardens and grass lands of peaty sandy soil with subsoil of clay, and running sand full of water; also as to the cheapest way of draining, &c." There can be no doubt as to what requires to be done to make such an estate as this productive in the highest degree, viz., to get rid

of the surplus water in the subsoil, and so to manipulate the surface soil that it may be composed of a suitable mixture of the three substances which abound so largely—peat, sand, and clay—excellent constituents for a good soil, and only requiring, in case the clay is not of a calcareous nature, the addition of a small quantity of chalk or lime to make it approach to something near perfection. The best means for carrying out these desirable improvements depends much on the conformation of the country and other local circumstances, such as the distribution of the underlying strata and the position or proximity of the natural watercourses. The water in the subsoil, passing through a pervious stratum of sand overlying an impervious stratum of clay, on its way from a higher to a lower level, requires to be intercepted by a drain of sufficient size and depth, cut at right angles to the general slant of the surface of the estate and at its highest level, and then led off in an open or covered drain by the shortest or easiest route to the nearest watercourse. This would clear the subsoil of all water except that which would fall in rain from above its own surface, and which, seeing that the surface soil is of such a porous and dry nature, would not be more than sufficient. No one can doubt but that applications of clay to soil composed of sand and peat materially increase its productiveness; the extent to which such applications are likely to be profitable, however, depends entirely on the cost of carrying the work out. In this instance, if, as I imagine, the clay underlies the whole or a great portion of the estate at no great depth from the surface, this is not likely to prove a very expensive matter. The clay may be obtained by opening pits at convenient spots and carting it over the surface, or it may be obtained from wells or drains opened at intervals, dug out, and spread over the surface. An analysis of the soil in its present condition as well as of the clay should be obtained in order to enable a correct judgment to be formed as to whether an application of chalk or lime would be necessary or advisable, and as to what manures would be most useful. It is probable, I think, that in a soil composed of peat, sand, and clay in suitable proportions, comparatively small quantities only of manure would be requisite. *J. E. Ewing, Norwich, January 19.*

**Horticultural Boilers.**—While bowing to the decision of the Editors, that this discussion should now cease, we, in justice to ourselves, feel compelled to ask to be allowed to correct the impression likely to be conveyed by Mr. Baines' last remarks. True, they do not alter the fact that the first three saddles failed, and that the second three failed also, but for which circumstance our tubulars would not have been called into requisition. How to remove these boilers was the difficulty, for it was practically impossible for Mr. Bull to do without heat, and therefore they could only be removed one at a time. The first and second were taken out forthwith, but when two of the tubulars had got to work, an agreeable change took place in the aspect of affairs, for they were found to consume a great deal less fuel and to create a greater heat than the three saddles combined. In fact, for the first time the amount of temperature was all that was required, and a feeling of profound anxiety gave place to a sense of great relief. This is vouched for by all concerned, and especially by Mr. Bull's excellent foreman, and also by the stoker. The third saddle boiler is now only awaiting removal (for Mr. Bull has resolved to replace it by a third tubular) until the weather is sufficiently favourable to admit of some slight alterations to the apparatus being made, and a fire has been lighted in it solely upon the ground that—as everybody knows—it is better to work three boilers moderately than to push two. The third tubular will be fixed as an auxiliary for severe winter work and as a reserve power—an arrangement for which should always be made in large establishments, especially when, like Mr. Bull's, they contain a very valuable collection of plants. As we stated several weeks back, our desire is that the public should do us the favour of inspecting these boilers. *J. Weeks & Co.* [In justice to Messrs. Weeks we insert their explanation, but no further discussion on the subject can be permitted. *Eds.*]

**Houses & Pits.**—Common brick pits are very useful, and perhaps better adapted for certain purposes than any other class of structure; but to my thinking they are not the most suitable for many uses for which they are in some places still built, and in others the only convenience yet employed—I refer to the growing of Pines, early Melons, and Cucumbers, and forcing Beans in winter. That these under skilful management are sometimes successfully grown in them I am well aware, but to accomplish this considerable more time and care has to be rendered by the grower than would be necessary if he had suitable houses at his command. Pits, when compared with convenient houses for such purposes, have many disadvantages, and not the least of these is their liability to drip, which alone sometimes causes the failure of a crop. There is also discomfort and inconvenience in

cold, windy, and wet weather in attending to anything which they may contain. It not unfrequently happens in the early spring months, when, day after day, we have piercingly cold winds, that the tender occupants of these pits are subjected to a check, either from exposure when the lights are opened that their wants may be attended to, or from want of attention, because it is unsafe to open them. I have a recollection of once living under an energetic, severe gardener, where we had a long range of pits entirely devoted in the winter months to growing Beans, which were planted in rows over beds of leaves, and did remarkably well but for the constant nightly visits of slugs. Every mild night these depredators were hand-picked by the unfortunate who was unluckily "on duty." Many and many a half-hour have I been thus employed, murmuring during the time about the pits, and wishing for houses with a walking-way through them in their place, to mitigate in some degree the disagreeableness of the unthankful office. I would recommend to all who have a number of pits, and are deficient of low, useful houses, and have a difficulty in getting new ones erected, to do as we have done here, *i.e.*, convert the former into the latter. It requires but little ingenuity to make of pits servicable lean-to's, span, or half-span houses; the best way of doing this will readily suggest itself to all. It need not be an expensive undertaking, and the improved and more certain crops which should follow will soon repay the outlay. We altered two ranges, as follows: of one which had lights 10 feet long we made half-spans; of the other, which had 7 feet sashes, spans were made. Of course this necessitated some alteration in the brickwork, and extra piping to keep up the required temperature. This was done for us by the Messrs. Weeks, of Chelsea; and may I mention, at a time when there is so much controversy respecting the merits of boilers, that their duplex tubulars are doing their work for us in every way satisfactory. *T. Coomber, Hendre, Monmouth.*

**Sternbergia lutea.**—Sutherland, and Hemsley in his Handbook based on the French work of Decaisne and Naudin, give *Sternbergia lutea* as flowering in September and October; so does Vilmorin, who adds that its French synonym is "Narcisse d'automne." I was surprised, therefore, yesterday to see its leaves appearing, but your correspondent "J. S." speaks of it as a spring flowerer, ying with the Christmas Rose as to which shall peep out of its prison-house first. Will some kind reader explain this apparent anomaly? *A.*

**Unseasonable Leafage.**—The peculiar tenacity with which leaves that should under ordinary conditions have long since fallen, still remain attached to the trees, is not confined to Peach trees, but may be seen abundantly evidenced on Apple trees, especially on young robust trees where the season's growth was strong and luxuriant. Most common are tufts of leaves, blackened by frost and cold, but still hanging on, and seeming to defy the force of all the elements to remove them. The old fable of the traveller and his cloak is recalled to mind by this unusual incident. All the force of the wind and the sterner elements combined only caused him to wrap his covering closer and more firmly round his body; but the moment the genial sun with its delicious warmth burst upon him the cloak was removed. Had the sun shed the persuasive influence of his power a little more freely last autumn, there would have been no leaves clinging firmly amidst the frost and storm to the Apple tree tops; but what the sun failed to do the winter cannot accomplish. Curious and interesting as is the unseasonable spectacle of deciduous trees carrying leafage through the winter months, it is not one that brings any pleasing associations. The clusters of leaves mean much green unripe wood, such as cannot prove fruitful next summer, and the hope of a crop of fruit is made more dim. Of course Apple trees rarely fruit upon the preceding year's wood; but the lack of maturity found there may most probably be also found in the actual fruiting wood and in the fruit-buds. If a good season for hardy fruits should come, it will, to some extent, confound our generally received opinions as to the connection that exists between cause and effect—between well matured ripe wood and a fruit crop. The subject is an interesting one, and no doubt the effects of one of the wettest and coldest summers of the century upon our probable fruit crop of next summer will be watched eagerly by all gardeners and fruitists. *A. D.*

**Winter and Spring Vegetables.**—Looking round gardens it is quite lamentable to witness the destruction the hard winter has wrought among vegetables, of which there must be a great dearth in the spring, as plantations of Broccoli and even old Cabbage stumps, so much depended on for furnishing pickings of greens, are nearly all killed, and no wonder, for everything was growing away freely when frost set in, and being caught in such an unprepared condition to meet excess of cold, all except the most

hardy were bound to succumb. Fortunately, Brussels Sprouts have escaped, which shows, if further proof were needed, what a trustworthy crop they are, and yet for all this they are not cultivated to anything like the extent their merits deserve, as not only are they to be depended on in all weathers, but they are unapproachable for delicacy of flavour. This latter good quality, however, only applies to them when the buttons are large and firm—a state they are rarely in except under the best management, as witness the rubbish one often sees in our markets, where stems are sold at from 3/4 each, which is not only a dear way of buying what little they have on them, but cutting them in that manner entails much waste, as were they left to grow on and the Sprouts gathered when fit, if they ever reached that desirable stage, the yield would be considerably greater. To get them to a fine state of perfection the seed is very rarely sown early enough, for to produce and develop the side shoots the plants must have great size and strength, which takes a long season for them to attain. In a general way the sowing is deferred till the middle of March, a period that is quite a month too late, and it will be found that the gatherings from such as are raised then bear no comparison to such as are obtained from plants got up in February, as with care and proper nursing these latter in good soils grow at least a yard high and have stems proportionate to their stature. To think of raising seed on unprotected borders at the season named is of course quite out of the question, as to get it to germinate the shelter of glass is necessary, together with a little bottom-heat, on which, if sown thinly in rows about 6 inches apart, the plants can stand till ready for pricking off later on in any cold frame, where they can stand and be hardened for their final removal in April or May. In order to give them every chance, the ground to receive them at that time should have been previously trenched and heavily manured, as they require great depth of tilth during the summer, otherwise their roots cannot get down, and any check has a tendency to bring on the blues, a malady to which the Brassica tribe are all subject in dry weather. It will be found a great help if before planting drills are drawn, like those made for Potatoes, the use of these being that liquid manure can be poured into them, and during the hoeing for the purpose of keeping down weeds these depressions gradually fill in, when the soil forms a great stay to the stems by assisting in keeping them erect. In ordinary winters nothing can be more useful up to Christmas than Couve Tronchuda, which in my opinion takes as high rank among Cabbage as the best Marrows do among Peas, the flavour being mild and delicious, and yet with all its good qualities it is seldom met with in gardens. Being a native of Portugal it is unfortunately rather tender, and although not actually killed by frost its quality is greatly deteriorated by its action, as has been the case this year. Like Brussels Sprouts it cannot well be sown too soon, and is quite deserving of all the attention advised for them, as when got in early and liberally treated, the heads come very large and heavy, a good one being sufficient for a moderate sized family. The several varieties of Scotch Kale are all valuable for winter and spring, the tops and sprouts being remarkably tender and good. The same may be said of the purple sprouting Broccoli, which is so useful and productive that it should be much more largely grown than it is. The thing with these is to sow early and thin, and to plant out before they become drawn, as it is surprising what a difference this makes in their favour. Those who have good breadths of young Cabbage this year will be fortunate, as they will be at a premium by-and-by, coming in as they always do when they are very acceptable, and assuredly they will be doubly so this season, for from present appearances there will not be much else to fall back on. To start them on and expedite their growth, it is a great help to run the hoe amongst them occasionally, so as to break the crust and let in the warm air, and the same with Spinach, which will be greatly quickened and benefited by a sprinkling of soot. *J. S.* [The best of all the hardy greens is the Cottager's Kale. *Eds.*]

**The Weather in Sutherland in 1879.**—The weather in the North during the past year has, as in other parts of the kingdom, been wet and cold, while the season of growth was mostly wet and unfavourable for the growth of crops. From what I can learn, however, we were on the whole better off in regard to the weather than our more southern neighbours. Should that have been the case, a few notes by way of comparison may be interesting. To begin with the winter 1878-79, it was in the North one of the most severe and protracted winters on record. The total snowfall here, close to the sea, amounted to 3½ feet. The thermometer went down to freezing point, or below it, on 103 nights. The lowest point reached was on December 28, when the protected thermometer registered 18° or 14° of frost. The ground was covered with snow fully three months. Hill farmers had in most cases to send their stock to within reach of rail, and immense quantities of forage

had to be brought into the North by rail to tide the stock over the winter. Had it not been for railway communication, the winter would probably have been as disastrous to stock as that of 1614, which is thus described by Sir Robert Gordon in his *History of Sutherland*:—"During the winter season the year of God 1614, ther fell out great abundance of snow, more than ordinarie, throughout all Scotland, which storms continued all the spring, evin until the moneth of May nixt ensuing, whereby the most part of all the hors, nolt, and sheip of the Kingdome did perish, bot chieflie in the north." There was wonderfully little damage done to plants and shrubs last winter by frost. Roses suffered most. A good few of the weakly growers appeared to be hard hit in the spring, but lingered on a few weeks between death and life, and in most cases ultimately died. Most of the Roses bought in last winter to make up vacancies very speedily followed those they replaced, leaving nothing but the labels to look at for the outlay. The spring months were fairly good after the beginning of April to the end of May—some heavy rains occurring about the middle and end of the latter month; however, June, July, and August were excessively wet, with dull cloudy weather and a generally low temperature; and to the prevalence of this state of things during these three growing and ripening months is due the lateness of the crops, and probably most of the failures in outdoor fruit and vegetables. The rainfall for these three months is 11½ inches, with 53 wet days—July alone contributing 5½ inches with seventeen wet days. Compare this with 1878—a fairly good year: during the same period we had 7½ inches for the three months with thirty-eight wet days, while July of that year shows 1½ inch with ten wet days. By the end of August things began to mend; a spell of fine breezy ripening weather set in, which long-looked-for change for the better lasted all through September and October, and came just in time to ripen and to harvest grain crops, and to materially improve the Potato and Turnip fields. For some garden crops the change came too late, the chief failure in the way of fruit being Strawberries. There was an appearance of a great crop, but the greater part of the fruit either did not swell up or rotted before ripening, a very small proportion only arriving at maturity. Apples were a good crop, but did not get properly matured, and were consequently more fitted for kitchen use than dessert. Plums ripened fairly well, notably Coe's Golden Drop and Victoria, though somewhat deficient in flavour. Small fruit was plentiful and good. Gooseberries were an extraordinary crop, and of good flavour considering the season. Among flowers Mignonette was a total failure; some of the more tender half-hardy annuals did badly, but the bedded-out plants, on which we depended for a display in the flower gardens and principal flower borders, did splendidly. It was generally remarked that the flower gardens here last September looked quite as well as in any former year. The rainfall during September and October was 3½ inches, while for the same two months in 1878 it was 7½ inches. The rainfall for the year 1879 was 29½ inches, with 187 days on which 0.01 or more of rain fell, being fully 2 inches under the average of the last ten years. The rainfall for 1878 was 33½ inches, with 180 wet days; while in 1877 (the worst year we have had here for many years) the rainfall was 40½ inches, with 244 wet days, being about 9 inches over the average. *D. McVie, Dunrobin Castle Gardens.*

**Early Strawberries.**—I made a small gathering yesterday, and a few fruits were gathered off the same plants in December. This batch was taken inside in the early part of November: they are old plants that had been forced last year, then shaken out and repotted. The variety is President, but had it been Vicomtesse Héricart de Thury I should have had a better return. I must mention that some of the fruits were set before they were brought in. President we know is not by any means the best to choose as an early forcer, although I have gathered it first-class in March, and they must be in ere this to do it. From off a batch of thirty-eight plants of President last year I gathered 17 lb.; these gatherings extended three weeks in April. *W. Ravenhill, Southgate, Jan. 19.*

**Hardiness of Maurandya.**—I have now (January 21) a Maurandya Barclayana green, untouched by frost, on the south side of the house, on the north of which I have just registered 12° of frost under a pent-house porch. The plant was self-sown in the cleft of some stonework, through drainage. *W. S. M.*

**Chinese Primroses.**—An extraordinary and beautiful collection of the above are growing and flowering, in the vigour of health and variety of colour, at Rouge Bouillon House, at the present time, some of the plants being more than a foot in diameter, with large heads of bloom raised 6 and 8 inches above the foliage—the individual florets being more than 2 inches in diameter, single, semi-double, and double,

and of the prettiest hues of rose, lavender, and white, sometimes striped. What further progress can be made in the cultivation of these winter-flowering favourites is a puzzle, as some of these are as much larger than the varieties in general cultivation as large-flowering Dahlias are than the Pompon varieties. *C. B. S., Jersey.*

PLANT PORTRAITS.

ANTHURIUM COLOCAS.FOLIUM, *Revue Horticole*, 1879, p. 452.

ARISEMA GALEATUM, N. E. BROWN, *Bot. Mag.*, t. 6457.—Native of Sikkim, flowered at Chiswick. Described by Mr. N. E. Brown in our columns, vol. xii., 1879, p. 102.

CHIONODOXA NANA, Boiss. et Heldr., *Bot. Mag.*, t. 6453.—Sometimes, but erroneously, called Puschkinia scilloides. It is far inferior for horticultural purposes to *C. Luciliae*.

CŒLOGYNE MASSANGIANA, *Floral Magazine*, t. 373.—See *Gardeners' Chronicle*, 1878, vol. x, p. 684.

EURYCLES AMBOINENSIS, *Revue Horticole*, p. 457, 1879.

GERANIUM ATLANTICUM, Boiss., *Bot. Mag.*, t. 6452.—A native of Algiers, whence it was introduced by Mr. Thistelton Dyer. It is like *G. sylvaticum*, but has more deeply divided silky leaves.

HEMANTHUS KALBREYERI, Baker, *Illustr. Horticole*, t. 354 (see *Gard. Chron.* 1878, p. 202).

ODONTOGLOSSUM CORDATUM, Lindl., *Illustr. Hort.*, t. 355.—Sepals yellow with transverse bars of brown petals yellow, with brown dots; lip cordate, white with a lilac blotch near the base, and spotted brown near the apex. Mexico.

ODONTOGLOSSUM MACULATUM, Llave, *Bot. Mag.*, t. 6455.—The plant figured under this name in 1855 is, it appears, the *O. cordatum* of Lindley. In the present plant the sepals are brown, the petals and lip yellow, with brown spots.

PAVONIA WIOTI, Ed. Mn., *Revue d'Horticulture Belge*, October 1, 1879.—A Brazilian Malvaceous plant, remarkable for the involucres surrounding each flower, and which consist of numerous narrow bracts of a rose-pink colour.

PEAR BERGAMOTTE HERTRICH, *Revue Horticole*, October 1, 1879.—Raised by M. Hertrich, of Colmar, about 1856, from seeds of Bergamotte Fortunei. The fruit ripens in March and April, and is of excellent quality.

PEAR RIVAL DUMONT, *Bulletin d'Arboriculture*, November.—Fruit large, pyriform; stalk short, thick; eye shallow; skin yellowish-brown, spotted with red; flesh melting, juicy, fragrant.

POTHOS GLAUCA, *Revue Horticole*, p. 453, 1879.

PRIMULA CAPITATA, Hook., *Gartenflora*, t. 985; see *Bot. Mag.*, t. 4550; *Garden*, Dec. 13.—Leaves oblong, tapering at the base; flowers lilac, in dense globose heads.

PSYCHOTRIA JASMINIFLORA, Hook. f., *Bot. Mag.*, t. 6454.—This is the *Gloneria jasminiflora* of Lind. and André. A figure was given in our columns, 1879, vol. xii., p. 201.

RHODODENDRON KATE WATERER, *Garden*, October 4, 1879.—One of Mr. John Waterer's (Bag-shot) raising. It is of good habit, hardy, with a fine bold truss of flowers. The latter are rose-coloured, with a yellowish tinge on the uppermost petal, which is moreover studded with brownish spots.

ROSE BARONNE PREVOST, *Journal des Roses*, October 1, 1879.—Raised by Desprez in 1841. Of this Alphonse Karr writes, "This is one of the beautiful flowers which has survived the revolutions of fashion."

ROSE JULES CHRÉTIEN, W. Paul's *Rose Annual*, 1879.—H.P.; habit robust; flowers large, finely shaped, deep bright red shaded with purple. J. Schwarz.

ROSE LITTLE GEM, W. Paul's *Rose Annual*, 1879.—A lovely little Moss Rose like the old Moss de Meaux, but the flowers are deeper and fresher in colour. W. Paul & Son.

ROSE MASTERPIECE, W. Paul's *Rose Annual*, 1879.—A seedling from Beauty of Waltham, with rich bright rosy-crimson flowers; growth vigorous, habit good. W. Paul & Son.

ROSE PRIDE OF WALTHAM, W. Paul's *Rose Annual*, 1879.—Habit of Countess of Oxford; flowers large, full, flesh-coloured, shaded with bright rose. W. Paul & Son.

ROSES SOUVENIR D'ELISE VARDEN, MARIE VAN HOUTTE; *Garden*, October 11, 1879.

SCUTELLARIA PURPURASCENS, Swartz, *Bot. Mag.*, t. 6464.—Herbaceous pulverulous with long-stalked cordate, ovate acute, remotely dentate leaves, and terminal racemes of flowers; the calyx has the curious form peculiar to the genus; the corolla tube is much longer than the calyx, slender, the central lobe of the lip deep violet. Brazil, Hort. Kew.

SYMPHYTUM PEREGRINUM, Ledebour, *Bot. Mag.*, t. 6466.—A tall-growing rough-skinned hardy perennial, with coarse ovate lanceolate stalked leaves, the upper ones sessile, narrower, and decurrent; flowers pink or bluish, in curved racemes; the five sepals are free nearly to the base and half the length of the corolla. Some interest attaches to this plant, as it is the Prickly Comfrey lately introduced as a forage plant. It is, however, not the true *Symphytum aspernum*. Sir J. Hooker considers that it may be merely a variety of *S. officinale*.

TRITONIA MACOWANI, *Revue Horticole*, Oct. 16, 1879.—A dwarf-growing species, with brilliant red flowers. T. marocana is given as a synonym for it.

VERONICA LYALLII, Hook. f., *Bot. Mag.*, t. 6456.—A creeping New Zealand species, with small ovate serrate, sessile leaves, and racemes of pale blue flowers. Introduced by Mr. Anderson-Henry.

WOODSIA, SPECIES OF, *European Ferns*, part ii.—The species figured are *M. glabella*, *ilvensis*, and *hyperborea*.

THE KURAM AND HARIAB VALLEYS.

In a practical point of view, says Dr. Aitchison, who has recently returned from Afghanistan, the great value to be attached to a botanical examination of the Kuram and Hariab valleys is its vegetable products, and the value they may possess for any export trade. The first of these is timber. The Deodar, our finest Indian Himalayan timber tree, forms dense forests, many of which it will be found can be easily worked. There is at present no limit to the amount and quality of this timber that can be obtained: means of exportation and forest conservancy are the subjects that now require to be studied.

Deodar timber used to be exported from near the Kuram river in Mongul territory by floating down the Kuram *viâ* Thull to near Banu, but this has for some years been given up.

In grain these valleys have heretofore had no export trade, producing no more grain than was absolutely required for local consumption. I may say the same of their fruits, except perhaps Walnuts and Amlak (*Diospyros*). The cause of this is simply oppression. There is land enough to double or treble the produce.

With a very little more than ordinary care of the water as it is expended, one-third more ground could be brought into cultivation; by appliances of a cheap nature, as wooden troughs, one-third more; and more expensive plant would enable it to be doubled.

The very first effects of our rule in this valley will show itself even this season in there being grain enough for our troops locally produced, and next year exportation will begin to take place towards the Punjab for exchange for cotton goods, which are at present expensive.

I cannot come to any opinion as to whether the nuts of Gerard's Pine were exported as a real trade article from the Hariab. I know that it is so from Khost.

The natives use no oil, splinters of the roots of Gerard's Pine, or of the stems of *Pinus excelsa*, being used in place of lights. A crude tar is made from the roots of the above Pines for local use. This is their nearest approach to oil. It is employed for local application to wounds and sores.

A little silk is produced at Shaluzan and some other villages; but in this there is no trade.

Probably the substance in which most trade is done, both on a large scale and barter, is honey. This is extensively exported by through-carriers to Kabul and the Khost country. Nearly every house in a village has its bees, from Kuram to Ali Khel.

In a scientific point of view, the great value of a thorough and careful research in the vegetation of this altogether new to science district is the material assistance it will give to the better knowledge of the geographical distribution of plants, and the meeting of the several floras of Europe, Persia, Afghanistan, Tibetan, Himalayan, and Punjab tropical, which I already see radiate round the Safed Koh range as a

focus, besides enabling one to obtain a more detailed and extensive knowledge of the peculiarities in the distribution of plants dependent on climatic zones, more or less influenced by a moist or dry atmosphere.

From the 600 species I have already collected, I can see already the immense value likely to accrue to scientific botanists by the collections I am now making, and consider that the Government should permit of the subject being thoroughly worked out.

The Weather.

STATE OF THE WEATHER AT BLACKHEATH, LONDON, FOR THE WEEK ENDING WEDNESDAY, JANUARY 21, 1880.

MONTH AND DAY.	BAROMETER		TEMPERATURE OF THE AIR.				Hygrometrical Deductions from Glaisher's Tables 6th Edition.	WIND.	RAINFALL.

- Jan. 15.—Dull till 11 A.M., fine and bright after till evening, then overcast. Snow fell between 7 and 9 P.M.
- 16.—A cold miserable day. Thin rain throughout. Damp.
- 17.—A fine pleasant day. Sunshine. Very cold.
- 18.—A fine morning. Hoar frost. Dull in afternoon and foggy. Very dark from 1 to 2 P.M. Clearer at night.
- 19.—A fine bright day. Raw cold. Cutting wind. Hoar frost. Very dry.
- 20.—A dull, bitterly cold day. Fine at night. Hoar frost. The coldest day since December 24, 1878, when the mean temperature of the day was 22°.
- 21.—A dull, overcast day. Very cold. Hoar frost. The maximum temperature occurred at midnight, viz., 32°.8.

LONDON: *Barometer*.—During the week ending Saturday, January 17, in the vicinity of London the reading of the barometer at the level of the sea increased from 30.56 inches at the beginning of the week to 30.61 inches by the morning of the 12th; decreased to 30.08 inches by the evening of the 16th, increased to 30.08 inches by the morning of the 17th, and decreased to 30.01 inches by the end of the week. The mean reading for the week at sea level was 30.33 inches, being 0.23 inch below that of the preceding week, and 0.42 inch above the average. The mean daily readings were above their averages on every day; the greatest departures in excess were 0.68 inch and 0.69 inch on the 11th and 12th.

*Temperature*.—The highest temperatures of the air observed by day varied from 38½° on the 16th, to 35° on the 11th, 13th, and 14th; the mean value for the week being 36¼°. The lowest temperatures of the air observed by night varied from 25¼° on the 13th, and 28° on the 12th and 14th, to 31¼° on the 16th; the mean value for the week was 29°. The mean daily range of temperature in the week was 7¼°; the greatest range in the day being 9¼°, on the 12th and 13th, and the least 5°, on the 11th and 15th.

The mean daily temperatures of the air and the departures from their respective averages were as follows:—Jan. 11, 32°.8, — 3°.5; 12th, 32°.6, — 3°.8; 13th, 30°.5, — 5°.9; 14th, 31°.4, — 5°.1; 15th, 33°.2, — 3°.3; 16th, 35°.4, — 1°.3; 17th, 33°, — 3°.8. The mean temperature of the air for the week was 32°.7, being 3°.8 below the average of sixty years' observations.

The highest readings of a thermometer with blackened bulb in vacuo, placed in the sun's rays, were 78¼° on the 12th, and 78° on the 17th; on the 14th and 16th the reading did not rise above 40°. The lowest readings of a thermometer on grass, with its bulb exposed to the sky, were 22¼° on the 13th, and 23¼° on the 12th. The mean of the seven lowest readings was 26°.

*Wind*.—The direction of the wind was variable, and its strength almost calm, except on the 11th, when it was moderately strong.

The weather during the week was cold, fine at times, but frequently very dull.

Snow fell on the 13th and 15th.

Rain or snow fell on three days during the week ; the amount collected was 0.21 inch.

ENGLAND : Temperature.—During the week ending Saturday, January 17, the highest temperatures of the air observed by day were above 42½° at Truro, Plymouth, and Liverpool, and below 39½° at Brighton, Blackheath (London), and Hull ; the mean value for the week from all stations was 41°. The lowest temperatures of the air observed by night were below 26½° at Truro, Bristol, Blackheath, Cambridge, Wolverhampton, Hull, and Bradford, and above 29° at Plymouth and Liverpool ; the mean from all places was 27°. The extreme range of temperature in the week was above 20½° at Truro, and below 11° at Brighton ; the mean range of temperature from all stations was 14°.

The mean of the seven high day temperatures was above 41½° at both Truro and Plymouth, and below 37° at Bristol, Blackheath, Wolverhampton, Nottingham, and Bradford ; the mean value from all places was 37¼°. The mean of the seven low night temperatures was below 30° at Blackheath, Wolverhampton, and Hull, and above 34° at both Truro and Plymouth ; the general mean from all stations was 30¾°. The mean daily range of temperature in the week was above 9° at Truro, and below 6° at Bristol, Norwich, and Sunderland ; the mean daily range from all places was 7°.

The mean temperature of the air for the week from all stations was 34½°, being 1½° lower than the value for the corresponding week in 1879. The mean temperature was above 36½° at both Truro and Plymouth, and below 33° at both Blackheath and Wolverhampton.

Rain or snow fell on two or three days in the week at most places. The heaviest falls were at Liverpool, 0.64 inch, Truro, 0.58 inch, Brighton, 0.51 inch, Wolverhampton, 0.50 inch, and Plymouth, 0.49 inch ; and the least falls were at Norwich, 0.02 inch, Bradford, 0.04 inch, and Sheffield, Hull, and Leeds, all 0.06 inch ; the average fall over the country was 0.29 inch.

The weather during the week was dull and cold, with slight fogs and occasional falls of snow and sleet.

SCOTLAND : Temperature.—During the week ending Saturday, January 17, the highest temperatures of the air observed by day varied from 49° at Perth to 39° at Edinburgh ; the mean value from all places was 43½°. The lowest temperatures of the air observed by night varied from 22° at Perth to 28° at Glasgow, Greenock, and Paisley ; the general mean from all stations was 26°. The mean range of temperature in the week from all places was 17½°.

The mean temperature of the air for the week from all stations was 33½°, being ½° lower than the value for the corresponding week in 1879. The highest was at Greenock, 35°, and the lowest at Edinburgh, 31½°.

Rain or snow was measured at Aberdeen to the amount of 0.47 inch, and at Edinburgh to the amount of 0.44 inch, at Paisley only 0.07 inch was recorded ; the average fall over the country was 0.25 inch.

DUBLIN.—The highest temperature of the air observed by day was 42½°, the lowest observed by night was 27½°, the extreme range was 15°, the mean temperature for the week was 35¾° ; and the amount of rain and snow was 0.34 inch.

JAMES GLAISHER, F.R.S.

Variorum.

FIORIN GRASS: AGROSTIS STOLONIFERA.—Fiorin is a long, creeping Grass, with a joint in each 6 or 8 inches of its length. From each joint it buds or shoots. In one county in the North it is grown extensively on "spent" or run-out bog. I have seen the most wonderful crops of hay from this Grass I ever saw growing. One farmer told me he often had 7 tons per Irish acre on spent bog which would, for other crops, be almost useless. I saw how it was planted by the same man. There was a large flat of cut-out bog, one half of which was under meadow of Fiorin planted the year before ; the other half had been in Potatos, which were just raised. This was in November. After the Potatos were cleared off, the harrow was run over the land to level and collect weeds, &c. Two men were started at one side of the plot, one at each end, to meet each other. Their work was to shovel about 2 inches off the surface of a breadth of about 3 to 4 feet. This they cast back over the ground unplanted. Two women followed, one after each man, strewing or spreading this Grass in its full length, being just fresh mown off a little patch on the adjoining meadow left for the purpose. After the Grass had been strewn on the space opened by the men, they then turned, and the surface of the next breadth was spread over the strewn Grass. This was the usual way of planting this crop in the part of the country I refer to ; but I believe a better plan is

to have the Grass cut up into short lengths, thus admitting of its being more regularly distributed. I think the value of this Grass is not generally known in this country, as I have travelled and lived in many parts of Ireland and never saw it grown only in the one district. The quality of the hay from Fiorin Grass surpasses, I believe, any other for sweetness and nutrition. It is a pity to see such large tracts of black land in this country in a state of waste comparatively, when it might be returning its owner a large crop of hay. I hope this may be in season just at present, when there is so much being done in improvement by landowners. I should mention that this Grass suits well for irrigation. The meadows I refer to were irrigated from an open drain at the head of the ground. This plan is worth trying. I speak from what I saw of the crop and mode of planting. A. M'Elwaine, Gilford, co. Down, in "Irish Farmers' Gazette."

TITHES COMMUTATION—SEPTENNIAL AVERAGES.—Mr. Montague Marriott, Editor of Wallich's Tithe Commutation Tables, writes:—As the result of the corn averages for the seven years to Christmas, 1879, published in the London Gazette, viz:—

Table with 2 columns: Crop (Wheat, Barley, Oats) and Average (per imperial bushel).

I beg to state that each £100 of tithe rent-charge will for the year 1880 amount to £109 17s. 9½d., or £117s. 4½d. per cent. less than last year. The following shows the worth of £100 tithe rent-charge for the last seven years:—

Table with 2 columns: Year (1874-1877) and Value (£100 tithe rent-charge).

The average value of £100 tithe rent-charge for the forty-four years elapsed since the passing of the Tithe Commutation Act is £103 2s. 1½d. Jan. 6.

Enquiries.

He that questioneth much shall learn much.—BACON.

NUMBER OF MEN REQUIRED TO WORK A GARDEN.—Will some of your correspondents kindly give their opinion of the number of men that it will take to efficiently work the following extent of ground:—2 acres of walled-in kitchen garden ; 2 acres of ground planted half with bush-fruits, the remainder used for kitchen crops ; and 11 acres of lawn and shrubberies, including flower-garden in proportion. W. A. C.

Answers to Correspondents.

CAMELLIA: Camellia. If the plant (or plants) is in a healthy state, and has got into a straggling condition of growth, it may be cut back with advantage to any extent, and if placed in gentle warmth will produce young shoots which will permit of its being fashioned into a handsome plant again. Of course this will take time. Perhaps, if you have several plants in this condition, it would be advisable to cut down a portion of them, leaving the rest till these are again furnished.

HOLLIES: W. D. & Sons. As Hollies cross readily enough, no doubt the suggested explanation of the origin of the several varieties is correct. We have seen a pinkish-fruited form before ; but whether this, or the yellow-fruited, are the same as those already in cultivation can only be ascertained by growing on young plants in the open. The growth in the woods from the seedling plants is lax and rank, which makes it impracticable to say what it would be under ordinary culture. They are worth trial. The fruit of the scarlet variety is distinctly obovate.

NAMES OF PLANTS: M. J. Dasylyrin acrotrichum ; 2, Adiantum trapeziforme ; 3, A. concinnum ; 4, Scelopendrium vulgare marginatum ; 5, Asplenium fragrans ; 6, crushed.—A. B. C. 1, Myrsiphyllum asparagoides ; 2, Eranthemum pulchellum.—A. Paul. Apparently Oncidium crispum.

NOTICE TO LEAVE: Enquirer. Under the circumstances described, we should consider a three months' notice the most fair arrangement for both parties.

SCALE ON PINE: G. Clark. It is the white scale, a very troublesome insect to remove, because it cannot be thoroughly got at. It has been destroyed by inverting the plants or suckers over hot fermenting dung in a close frame. Your best plan, perhaps, would be to syringe well with a mixture of a wine-glass of paraffin to 4 gallons of water, and immediately rinse them in pure water, and invert them till the liquid has drained away, so that it may not settle in the heart or in the axils of the leaves.

SEAKALE: J. Garland. If you will send a sample of the grubs we will have them examined to see if it is likely they are the cause of the mischief. We should be rather inclined to think the gravelly soil is at fault. Try a dressing of salt, and work in some fibry soil and leaf-mould.

SMUT: Old Forester. The smut on your leaves indicates a dirty condition of the plants, from the presence of insects. Give the plants a good cutting-in now, and clean them thoroughly ; then, by fumigating and other

means, including plentiful syringings, keep them clear of such pests in future.

SEWAGE FARM: G. Randall. By the aid of the sewage the land should produce in fair condition any of the ordinary garden crops, and we should grow those which would be most readily disposed of in your locality—Cabbages, Celery, Onions, Broccoli or Cauliflowers, Rhubarb, &c.

TUBEROSES: W. H. E. The difference between American and Italian Tuberoses consists only in the difference in size between the roots imported from the two countries ; those coming from America being the largest and best. Pearl is the American name of a variety which is recommended as being of dwarf habit than the typical plant. We understand, however, that the difference in height is only seen when the plants are grown in cool houses ; though we have no actual experience on this point.

VINES INFESTED WITH PHYLLOXERA: F. Yes ; certainly.

Markets.

COVENT GARDEN, January 22.

The return of frost is again seriously affecting the supplies of outdoor goods to the market, causing a rise in the value of all sorts of vegetables. Our Apple market is dormant, there being but few inquiries. Cucumbers are in demand, supply being short, and fancy prices made. James Webber, Wholesale Apple Market.

Table with 2 columns: Fruit (Apples, Lemons, Cob Nuts, Grapes) and Price (s. d. s. d.).

Table with 2 columns: Vegetables (Artichokes, Asparagus, Beet, Brussels Sprouts, Cabbages, Carrots, Cauliflowers, Celery, Chilis, Cucumbers, Endive, Garlic, Herbs) and Price (s. d. s. d.).

Potatos:—Regents, 100s. to 140s. ; Flukes, 120s. to 150s. ; and Champions, 130s. to 150s. per ton. German produce is making from 4s. to 7s. per bag. The supply is stopped now in consequence of the frost.

Table with 2 columns: Plants in Pots (Arum Lilies, Azaleas, Begonias, Bouvardias, Cinerarias, Cyclamen, Cyperus, Dracena terminalis, Erica gracilis, Euonymus, Ferus) and Price (s. d. s. d.).

SEEDS.

LONDON: Jan. 21. — There is now more enquiry generally for farm seeds. Red Clover keeps steady. The high prices which have been obtainable on Mark Lane for choice yearling English red have brought forward a good number of samples, the majority, however, of which show very poor quality. French seed is dull. Some fair arrivals here of American and Canadian Clover may shortly be expected. Alsike, white, and Trefoil meet a quiet demand. In Italian Rye-grass the late advance is well maintained; no seed appears to be now left in the hands of French growers. Perennials find buyers on former terms. For Lucerne and Sainfoin the enquiry is small. Timothy seed continues exceedingly scarce. Tares, both spring and winter, are in brisk request at hardening currencies; stocks of either variety are light. With regard to Canary seed values are drooping, but Hemp and Millet are firm. Owing to the colder weather, there is more enquiry for boiling Peas. Haricots and Lentils are neglected. For Linseed the sale is slow. *John Shaw & Sons, Seed Merchants, 37, Mark Lane, London, E.C.*

CORN.

At Mark Lane on Monday there was very little life in the trade. As regards Wheat, prices were 1s. per quarter lower. Holders were firm at this reduction, but millers operated very slowly. Fine malting Barley was scarce and pretty steady in price; but there was a dull sale for all feeding qualities. Malt was quiet at about late rates. Oats were in good supply, but the demand was very poor. Maize was perhaps rather better held; but no positive improvement could be reported. Beans and Peas were dull, but without material change. Flour was in limited request, and rates moved somewhat in favour of buyers.—On Wednesday holders of Wheat were firm, but no decided rise in prices could be reported. Barley was slow of sale, and all feeding qualities were easy in price. Oats were steady. Maize was rather more sought after, and quotations were better supported. Beans and Peas changed hands on former terms. Flour was neglected, and quotations were nominally without change.—Average prices of corn for the week ending Jan. 17:—Wheat, 45s. 11d.; Barley, 37s. 2d.; Oats, 21s. 1d. For the corresponding period last year:—Wheat, 38s. 11d.; Barley, 36s. 11d.; Oats, 19s. 8d.

HAY.

The Whitechapel Market report for Tuesday states that there was a fair supply of fodder, the demand for which remained dull at about late rates. Prime Clover, 100s. to 120s.; inferior, 70s. to 95s.; prime meadow hay, 80s. to 95s.; inferior, 30s. to 70s.; and straw, 30s. to 37s. per load. On Thursday there was a fair supply. Trade was dull for inferior qualities, but the prices were unchanged for best stuffs.—Cumberland Market quotations:—Superior meadow hay, 98s. to 105s.; inferior, 40s. to 72s.; superior Clover, 118s. to 130s.; inferior, 80s. to 95s.; and straw, 35s. to 40s. per load of 36 trusses.

POTATOS.

At the Borough and Spitalfields Markets there has been a pretty fair demand for Potatoes, and all good descriptions remain firm in price. The supplies are moderate. Scotch Regents, 140s. to 160s.; do. Champions, 140s. to 150s.; Lincoln Regents, 140s. to 150s.; Victorias, 160s. to 180s.; French whites, 85s. to 95s. per ton. Belgian kidneys, 5s. 3d. per hundredweight.—The imports into London last week comprised 17,557 barrels from Hamburg, 1000 from Bremen, 1000 Harlingen, 490 Ghent, and 50 tons from Antwerp.

COALS.

The prices current at market during the week have been as follows:—East Wylam, 16s.; West Hartley, 14s. 6d.; Walls End—Hetton, 16s. 6d.; Hetton Lyons, 15s.; Lambton, 16s.; Original Hartlepool, 16s. 6d.; Wear, 15s.; South Hetton, 16s. 6d.; Chilton Tees, 15s. 6d.; East Hetton, 16s.; Tees, 16s. 3d.; Hawthorns, 15s. 3d.; Tunstall, 15s.; East Hartlepool, 16s.; South Hartlepool, 15s. 6d.; Radford Navigation, 16s.

**Government Stock.**—The closing price for Consols on Monday was 97½ to 98, for both delivery and the account. The same figures were registered at the close of Tuesday's transactions. Wednesday's closing price was 98 to 98½ for both delivery and the account. The final quotation on Thursday was, for both delivery and account, 98½ to 98½.

# GYDE'S IMPERIAL FERTILISER

FOR  
Flowers, Fruit, & Vegetables.

Established 1839.

40  
YEARS  
of

INCREASING SUCCESS.

Perfection in Artificial Manures for all Plants on British Soil and Conservatories.

Numerous Testimonials from all parts of the Kingdom justify us in stating that our different Manures and Plant Foods are perfect.

## THE IMPERIAL FERTILISER

Is a highly-concentrated Manure, and is admitted by all practical Men who have tried it to be the very best ever offered to the public. Some Manures give beauty of bloom at the expense of the plant's vitality, causing a consumption of the plant's stamina and roots, in order to produce, as it were, a hectic flush of short duration; whereas in every case the bloom on a plant nourished on our Imperial Fertiliser is a proof of sound health.

It also gives abundant growth to Vegetables, and fertility to all.

### RESPONSIBLE AGENTS WANTED.

1 cwt., 16s.; ½ cwt., 9s. 6d.; ¼ cwt., 7s.;  
14 lb., 5s.; Tin, 1s.

To be obtained of principal Florists and Seedsmen.

## GYDE'S AMAZONAS SANA COPIA POTATO MANURE

(REGISTERED)

Is a high-class Fertiliser. It is also a great Preventive of Disease, and by using a fair quantity will increase the size and yield twofold.

We wish to call attention to the extract below, from *Farm Journal*, Jan. 17, 1880:—

### EXTRACT.

"One step in the right direction has been taken by the proprietors of Gyde's Chemical Manure Works, Stroud, Gloucester, in that, confident of the success of their Amazonas Sana Copia Potato Manure, they have established a register of those who use their manure, so that growers in distant parts may exchange sound seedlings. This is manifestly a great advantage. We do not, of course, profess any practical knowledge of the Sana Copia Manure; but we have seen letters of perfect satisfaction concerning it, speaking in such terms as have led us to hope the evil days for the Potato may soon leave us. These letters, or testimonials, would not of themselves justify us in calling the attention of our readers to a comparatively unknown article; but we have every confidence in the firm, that they conscientiously believe what they say concerning it. One paragraph in their circular particularly took our notice. They profess that their Sana Copia Manure so strengthens the plant that it can defy unfavourable atmospheric influences; and we cannot see that it can do this without also enabling it to resist disease through the soil."

Supplied in 1 cwt. Bags.

Price, £12 per ton; 12s. 6d. per cwt.

Carriage paid on orders of 5 cwt. and upwards within 100 miles of the Works.

Post-office Orders to W. TRINDER,  
STROUD CHEMICAL MANURE WORKS,  
STROUD, GLOUCESTERSHIRE.

Cheques crossed County of Gloucester Bank.

SPECIAL QUOTATIONS TO LARGE CONSUMERS.

COCOA-NUT FIBRE WASTE,  
1s. per bag, 30 bags for 20s. No charge for bags. Truck-load (loose), free to rail, 25s.—BULBECK AND SON, Suffolk Place, Snow's Fields, Bermondsey, S.E.

AMIES' CHEMICAL MANURE COMPANY, LIMITED,  
79, MARK LANE, LONDON, E.C.

GISHURST COMPOUND.—  
Used by many of the leading Gardeners since 1859, against Red Spider, Mildew, Thrips, Greenfly, and other Blight, in solutions of from 1 to 2 ounces to the gallon of soft water, and of from 4 to 16 ounces as a winter dressing for Vines and Fruit Trees. Has outlived many preparations intended to supersede it. Sold Retail by Seedsmen in Boxes, 1s., 3s., and 10s. 6d. Wholesale by PRICE'S PATENT CANDLE COMPANY (Limited).

### An Important Discovery.

SOLUBLE FIR TREE OIL INSECTICIDE.—The cheapest and best of all insecticides for small and large nurseries, plantations, &c. Once tried always used. Full directions with each Bottle, price 1s. 6d., 2s. 6d., and 12s. 6d. each. Special quotations for large quantities.

London Agents: HOOPER AND SONS, Covent Garden and from all Seedsmen. Manufactured by E. GRIFFITHS HUGHES, Operative Chemist, Victoria Street, Manchester.

GAWITH'S FIREFLY CIGARETTE, for destroying Thrip, Greenfly, and other greenhouse Pests. The advantages of fumigation over all other methods of destroying these enemies must be apparent to all horticulturists. However skilfully applied, insect-destroying powders cannot reach every one, whereas by rendering the atmosphere of a house destructive, all are reached. These Cigarettes are clean and effective; one trial is enough to convince the most sceptical that a long-looked-for handy and clean destroyer has at last been found. The Cigarette merely requires suspending by the wire attached, lighting at each end as in ordinary fireworks, and does its own work without further attention.

Price 1s. 6d. each. To be had from Seedsmen, and from JOHN E. GAWITH, Sole Manufacturer, Lowther Street Tobacco Manufactory, Kendal.

One Fume effectually destroys the whole family of  
APHIDES.

Two Fumes in quick succession will annihilate the  
THRIP.

IN IRON,

IMPROVED FUMIGATING PAN,  
ALSO THE IMPROVED AND ONLY GENUINE  
MEDICATED TOBACCO PAPER,  
"Ready Cut Up," "Self Consuming,"  
"Most Effective," "Perfectly Safe."

This "Special" Article has now been extensively used by Horticulturists for some years, and hundreds can bear testimony to the fact that it is the cheapest, safest, and most efficacious Asphyxiate in the market.

TO BE OBTAINED ONLY FROM

JAMES DICKSON & SONS,  
108, EASTGATE ST., CHESTER.

Who will be pleased to send, post-free, on application, Circular containing Testimonials and all particulars.

Price, 1s. 8d. per pound.

Carriage Paid on Orders of 28 lb. and upwards.

ORCHID BASKETS (great reduction in).—Teakwood Rods, rounded edges, made with strong copper or galvanised wire. Every kind made for growing Orchids, at 50 per cent. less than usually charged. Sample sent carriage free on receipt of twelve stamps. TEAK RODS supplied, prepared and drilled, ready for making up.

ALFRED GRANT AND CO., Steam Works, 39½, Leather Lane, London, E.C.

Under the Patronage of the Queen.  
**J. SMITH'S IMPERISHABLE STRATFORD LABELS.**

The above Labels are made of a White Metal, with RAISED BLACK-FACED LETTERS.  
 The *Gardeners' Magazine* says:—"We must give these the palm before all other plant labels, as the very first in merit."  
 Samples and Price Lists free.  
 J. SMITH, The Royal Label Factory, Stratford-on-Avon.

**CUPISS'S CONSTITUTION BALLS.**

This justly celebrated Medicine for more than 30 years has proved to be the best and cheapest for **HORSES AND NEAT CATTLE**, Cheaper because required to be given only once a week, and not every second or third day.  
**PRESERVING HEALTH, VIGOUR AND CONDITION.**  
 Their cost, too, is saved by the food turning to a better account, for it is a fact that Horses will keep up their condition better upon three feeds of Oats daily when a Ball is occasionally given than with four feeds without the Balls.  
**REARERS OF NEAT CATTLE**  
 Will find the Balls most valuable, not only in case of disease, but in Rearing Young Stock, they will Grow to a Larger Size, come to Perfection Sooner, and to a Greater Weight with the same quantity of food if a Dose (see directions) of the Balls is given occasionally.

Prepared by the Proprietor,  
**FRANCIS CUISS, M.R.V.C.S., DISS, NORFOLK.**  
 Author of the PRIZE ESSAY on the "Diseases of the Liver of the Horse."  
 Sold by all Chemists, in Packets at 1s. 9d. and 3s. 6d. each; or 7 large Packets for 21s., or 7 small for 10s. 6d.  
 Gentlemen using the Balls may consult the Proprietor gratuitously.

**ANDERSON'S RUSSIA MATS**  
 For COVERING, TYING, and PACKING.

**WOOD AND CO.'S**

**STAR ANTHRACITE SMOKELESS STEAM COAL**

is now being extensively used by many of the principal Growers, and is found to be preferable to any other kind of fuel in respect to cheapness and durability, and particularly on account of its being perfectly free from sulphur, and that it does not clinker the fire-lights.

WOOD AND CO. deliver in truckloads to any Railway Station, prices for which can be had on application, or can be delivered by Wood & Co.'s Vans (in the Metropolis).

WOOD AND CO. append a testimonial given to them by Messrs. Beckwith & Sons, a firm of great experience, and who have kindly allowed them to make whatever use of it they may think fit.

Tottenham Nurseries, London, N., Dec. 28, 1877.

To Messrs. Wood & Co.

Dear Sirs,—With reference to your enquiry respecting the "Star" Anthracite Coal with which you supplied us—as to how it suited, its economy or otherwise—we have much pleasure in informing you that in every respect it is the best Anthracite we have ever used. We find there is no smoke from it, which is very essential, and there is no trace of sulphur. It requires very little stoking, and leaves very little ash, and certainly does not clinker. Our consumption of coal is about 500 tons a year, and we have no hesitation in saying that, by using your "Star" Coal in the place of ordinary fuel, we shall effect a saving of at least £100 this year. We attribute this to the powerful and lasting properties of your Coal.—Yours faithfully,

(Signed) G. BECKWITH & SONS.

WOOD AND CO. supply all kinds of Coal for House and Manufacturing purposes, in single truckloads, to any Railway Station, at Wholesale rates, prices for which will be sent on application.

**JONES'S PATENT "DOUBLE L" SADDLE BOILER.**

These Boilers possess all the advantages of the old Saddle Boiler, with the following improvements—viz., the water-space at back and over top of saddle increase the heating surface to such an extent that a "PATENT DOUBLE L SADDLE BOILER" will do about twice the amount of work with the same quantity of fuel; the cost of setting is also considerably reduced, and likewise the space occupied; at the same time these Boilers are simple in construction, and being made of wrought-iron are not liable to crack. They are made of the following sizes:—

Sizes.			To heat of 4-in. Pipe.	Price.
High.	Wide.	Long.	Feet.	£ s. d.
20 in.	18 in.	18 in.	300	7 0 0
20 "	18 "	24 "	400	8 0 0
20 "	18 "	30 "	500	9 0 0
24 "	24 "	24 "	700	12 0 0
24 "	24 "	30 "	850	14 0 0
24 "	24 "	36 "	1000	16 0 0
24 "	24 "	48 "	1400	20 0 0
28 "	28 "	60 "	1800	25 0 0

Larger sizes if required.

From Mr. CHARLES YOUNG, Nurseries, Batham Hill, S.W., May 29, 1873.

"Having given your Patent 'Double L' Boilers a fair trial at my Nurseries, I beg to say that they are most satisfactory. I consider them the best in use, and without doubt the most economical of all boilers; they will burn the refuse of other tubular boilers I have in work."

PRICE LISTS of HOT-WATER PIPES and CONNECTIONS, with Boilers, of all sizes and shapes; or ESTIMATES for HOT-WATER APPARATUS, erected complete, will be sent on application.

J. JONES AND SONS, Iron Merchants, 6, Bankside, Southwark, London, S.E.  
 When ordering Boilers please refer to the above advertisement.

Farms, Estates, Residences.

Any one desirous of Renting a Farm or Residence, or Purchasing an Estate, can have copies of the MIDLAND COUNTIES HERALD supplied free for six weeks on stating the purpose for which the paper is required, forwarding name and address, and six halfpenny stamps for postage, addressed “Midland Counties Herald Office, Birmingham.” The Midland Counties Herald always contains large numbers of advertisements relating to Farms, Estates, and Residences for Sale and to be Let.

PARTNERSHIP.—Wanted in an old-established Seed and Nursery Business in the Eastern Counties, a Partner with £700 to £800 capital, to take the place of one who is unable to take an active part in the management. Thorough investigation granted to any suitable applicant.—Apply by letter only, to OMEGA, Reform Club, Liverpool.

Head Working Gardener, Married, Without Family WANTED, on February 1, at Chislehurst. Very little glass. Assistant kept. Wages 25s. per week, with free house and gas. Apply, by letter, to S., care of Housekeeper, 2, Gresham Buildings, Basinghall Street, E.C.

WANTED, a HEAD WORKING GARDENER, married, without encumbrances, for a responsible situation.—Apply, in first instance, to Rev. G. TUGWELL, Bathwick Rectory, Bath.

WANTED, a GARDENER (WORKING).—Must possess a practical knowledge in all branches. Character for ability and sobriety from former employer indispensable.—Apply to A. B., Bradford & Sons, Yeovil.

WANTED, two respectable Young GARDENERS, for a large Garden in Ireland—one for the Houses, the other for Outdoor Department under the Foreman. Both must give full particulars as to experience, in own handwriting. A good knowledge of Indoor Plants in the one case, and of Hardy Plants in the other, is necessary. The successful applicants will have excellent facilities for self-improvement. Preference will be given to Irishmen who have had experience in a London nursery, in addition to practice in good private gardens.—A. BARD, “Publisher,” 37, Southampton Street, Covent Garden, London, W.C.

WANTED, a WORKING FOREMAN, to take the entire Management of a Market Garden, to Grow for Sale Fruit, Flowers and Vegetables; 8 acres of Fruit, in all about 15 acres, with Vineries, Conservatory, Cucumber-houses, Pits, &c. None need apply who are not well accustomed to the trade. Wages £1 1s. per week, with a good cottage.—W. O. WARD, Market Gardener, Ramsey, Harwich, Essex.

WANTED, a GROUND FOREMAN, principally for Roses, with a fair knowledge of Fruit and other Trees and Shrubs, and a good Salesman. None but experienced Trade Growers need apply.—THOMAS S. WARE, Hale Farm Nursery, Tottenham, London.

WANTED, an ASSISTANT PROPAGATOR and GROWER of Indoor Plants, chiefly for Market.—Apply, stating wages expected, with reference, to JAMES ANDERSON, Nurseryman and Valuator, Meadowbank, Uddingston, Glasgow.

WANTED, a MAN and WIFE—former as Gardener, and attend to Cow. Wife must be good Cook. Ages about 35, no family. Good personal characters required.—Apply by letter or personally to J. R., 77, Farringdon Street, City, E.C.

WANTED, a Young MAN, to make himself generally useful, having a knowledge of Gardening, and able to write.—Letters, stating age and wages required, to W., 8, Great St. Helens, Bishopgate, E.C.

WANTED, one or two Young MEN to take charge of divisions of the Herbaceous Department under the manager.—THOMAS WARE, Hale Farm Nursery Tottenham, London.

WANTED, in a Small Nursery, an active and steady Young MAN, with some knowledge of Stove and Greenhouse Plants.—Apply to C. FAIRNINGTON, 16, Maida Vale, Edgware Road, London, N.W.

**WANTED**, an active, steady Man, of good address, as Indoor PROPAGATOR and GROWER—one who thoroughly understands Foliage and Flowering Plants for Table and Sale generally. A good character indispensable.—State age and wages required, to JOSEPH GREEN AND SON, Garforth Nurseries, near Leeds.

**WANTED**, a steady industrious MAN, for General Work; Bulbous Plants and Ferns principally grown.—Address, with particulars, wages required, &c., to T. H. HARE, Bulb and Fern Grower, Sittingbourne, Kent.

**WANTED**, for the Counting-house, a good WRITER, accustomed to Invoicing. Salary at the rate of £70 per annum.—Address application with particulars of experience, B. S., Barr & Sugden, 12, King Street, Covent Garden, W.C.

**WANTED**, a CARPENTER, for a Gentleman's place—one willing to make himself useful.—State wages required to WM. TROY, Gardener, Ankerwycke, Staines.

**WANTED**, respectable Young WOMEN, for Light Work. Good Writing indispensable.—Address, stating age, &c., to M., *Gardeners' Chronicle* Office, W.C.

**WANT PLACES.**

**TO GENTLEMEN and MARKET GROWERS**.—Advertiser would undertake to Manage a Business for a Gentleman, with a large amount of Glass, or intending to Build, to grow on an extensive scale entirely for Market, Grapes, Peaches, Strawberries, Mushrooms, Cucumbers, &c. Also choice Flowers, best adapted to supply a first-class Cut Flower Trade demand. First-class references.—J. READ, 5, Duffield Street, Battersea, S.W.

**To the Trade.**

**MANAGER**, in a First-class Business, where Hard and Soft-wooded Plants, Cut Flowers, Cucumbers, &c., are in great demand.—Age 35; accustomed to the supervision of a large staff of men. State salary and particulars.—REX, Mr. Hudson, 6, Commercial Terrace, Clapham Junction, London, S.W.

**To Market Gardeners.**

**MANAGER**.—Good practical man; good Grape, Cucumber, Strawberry, Rhubarb, and Seakale Grower. Several years' experience. Good Packer. State wages.—Mr. SML. TYSON, London Road, Lindal-in-Furness, Lancashire.

**GARDENER (HEAD)**.—Age 29, unmarried; respectable and intelligent (Austrian). Seventeen years' best experience in every section. Twelve first-class testimonials. Three years in England, and speaks English, French, German and Slavish.—O. K., 12, New Street, Covent Garden, W.C.

**GARDENER (HEAD)**.—J. F. CHATER, Nurseryman, 204, Camberwell Road, S.E., can highly recommend a practical Head Gardener to any Lady or Gentleman. Well up in Forcing both Fruit and Flowers.—For particulars address B., as above.

**GARDENER (HEAD)**, where another is kept.—Age 37, married, no children; understands Vines, Melons, Cucumbers, Greenhouse Plants, Fruit, Flower, and Kitchen Gardening. Good references.—J. WEBB, 1, Park Place, Spital, Windsor, Berks.

**GARDENER (HEAD)**.—Age 38; married, small family; understands Vines, Pines, good Cucumber, Melon, and Mushroom Grower. Good character and references. Leaving through death.—W. E., 55, New Street, Horsham, Sussex.

**GARDENER (HEAD)**; age 26, married, no incumbrance.—Advertiser is open to an engagement with any Nobleman or Gentleman requiring the services of a thorough practical Man, understanding all branches of the profession, and good Orchard Grower. First-rate testimonials.—C. M., 46, Norwich Street, Cambridge.

**GARDENER (HEAD)**, to any Nobleman or Gentleman requiring the services of a thorough practical man.—Age 32, married, no family; well experienced in all branches of the profession, Land and Stock. Wife can Manage Poultry if required. Good character.—ALPHA, Hide's, Stationer, New Malden, Surrey.

**GARDENER (HEAD)**, first-class; age 34, married, one child; Protestant.—THOMAS WOODFIELD, for four years Head Gardener at Watcombe Park, Torquay, will be happy to engage with any Nobleman or Gentleman in the above capacity. Well up in all kinds of Ground-work, Superintending Labour, &c. Present employer will give good character. Late principal Foreman at Burghley, under Mr. R. Gilbert, who will be happy to answer any enquiries.—T. WOODFIELD, Watcombe Park, Torquay.

**GARDENER (HEAD)**; age 45, married, one child (age 16).—Mr. BAINES, Southgate, London, N., can recommend to any Nobleman or Gentleman, in want of a Gardener, a thoroughly intelligent and trustworthy man, who has not adopted the calling simply for a living, but has from boyhood been heart and soul in the pursuit. Is one of the best Fruit, Plant, and Vegetable Growers in the country. Fully capable to plan and carry out new work or alterations, including Horticultural Buildings. Can be highly recommended by the gentleman he has served as Head Gardener for nine years.—Address as above.

**GARDENER (HEAD, WORKING)**.—Age 28, married, no family; fifteen years' practical experience in all branches of the profession. Good character.—GARDENER, Well Vale, Alford, Lincolnshire.

**GARDENER (HEAD, WORKING)**.—Age 31, single; first-class Grower of Fruit, Flowers, and Vegetables. From the North. Highest character.—H., 30, Furley Street, Peckham, S.E.

**GARDENER (HEAD, WORKING)**.—Age 32, married, one child; understands Vines, Peaches, Melons, &c., also Flower and Kitchen Gardening, or the Laying-out and Planting of a New Place.—HORTUS, Railway Bookstall, Harrogate.

**GARDENER (HEAD, WORKING)**.—Thoroughly understands Early Forcing of Vines, Strawberries, Peaches, Melons, Cucumbers; also Flower and Kitchen Gardening in all branches; Pasture and Arable Land. Wife Dairy and Poultry if required. Long good character.—E. H., Post-office, Chorleywood, Rickmansworth, Herts.

**GARDENER (HEAD, WORKING)**.—Age 34, single; sixteen years' experience. Foreman for twelve years in last situation; left through establishment breaking up. Understands the Cultivation of Orchids, &c., and the General Management of a Gentleman's Garden. First-class references.—C. B., 42, Norman Road, St. Leonards-on-Sea.

**GARDENER (HEAD, WORKING)**.—Middle-aged, married, no family; practical knowledge in all branches of Forcing Hothouse or Greenhouse Plants; also Kitchen Garden and Pleasure Grounds. Can be highly recommended. Fourteen years' character.—E. C., Carter, Butcher, 39, Mare Street, Hackney, London, E.

**GARDENER (HEAD, WORKING)**.—Age 36; well up in Vines, Melons, Peaches, Stove Plants, &c., and Flower and Kitchen Gardening. Fifteen months with Sir Sydney Waterlow. Eight years in previous situation. Good character.—H. N., Fairseat Cottage, Dartmouth Park Hill, Highgate, N.

**GARDENER (HEAD, WORKING)**, where another man, or men, are kept.—Middle-aged, married; understands Greenhouse, Vines, Peaches, Melons, Cucumbers, Flower and Kitchen Gardening. Will take Charge of Meadow Land if required. Fourteen years' good character.—Address, stating wages, particulars, &c., to T. F., Mr. Rattee, Postman, Enfield, N.

**GARDENER (HEAD, WORKING)**, where two or more are kept.—Age 26; over twelve years' thorough practical experience in all branches; well up in all kinds of Plants, Fruit, and Flowers, and general routine of Gardening. Can be highly recommended. Four years' excellent character from present employer.—W. E., Messrs. Sutton, Fareham, Hants.

**GARDENER (HEAD, WORKING)**.—Age 29, single until suited; twelve years' experience in good places. Understands Growing Pines, Vines, Peaches, Cucumbers, Melons, Vegetables, Stove and Greenhouse Plants, and good Kitchen Gardener; also understands Orchids and all kinds of Gardening. Can be highly recommended by present employer. Seven years' character as a Foreman in the house and outdoor work.—S. KICK, Pontypool Park Gardens, Pontypool, Monmouthshire, South Wales.

**GARDENER (HEAD, or good SINGLE-HANDED)**.—Age 34, single; thoroughly practical. Eighteen years' experience. Can be highly recommended. Good character.—A. F., Whitelift, Princes Risborough, Bucks.

**GARDENER (HEAD, or SECOND)**, in a first-class establishment.—Age 27, single; experienced in all branches. Good references.—HORTUS, 58, Park Street, Maidenhead, Berkshire.

**GARDENER (FIRST-CLASS)**; age 28, married, no family.—A GENTLEMAN wishes to recommend the above to any place of trust.—ALEX. DONALD, Esq., Royal Terrace Gardens, Edinburgh.

**GARDENER**, where one or more are kept, or SINGLE-HANDED.—Age 24; eight years' good reference.—Apply, stating wages, to W. H. S., 3, Albert Street, Dawlish, Devon.

**GARDENER**.—Thorough; twenty years' experience in all branches, Land and Stock. Wife Dairy if required. Good personal character.—E. J., 17, Londesborough Road, Stoke Newington, N.

**GARDENER**.—Age 33, married; thoroughly understands Plant Growing, Forcing, Fruit, Flower and Kitchen Gardening. First-class character and testimonials.—W. M., 3, Sydney Road, South Norwood, S.E.

**GARDENER**, where one or more are kept, or SECOND, in a large establishment.—A steady man; thoroughly understands Greenhouse and Stove Plants, &c. Good recommendation from last place.—S. CLARKE, Kidlington Rectory, Woodstock, Oxon.

**GARDENER (SINGLE-HANDED)**.—Age 28; thoroughly understands all branches. Good character from present employer.—W. L., Woburn Chase, Addlestone, Surrey.

**GARDENER (SINGLE-HANDED)**.—Age 22; understands Flower and Kitchen Gardening, Greenhouse, Cucumbers, Melons, &c. Five years' experience.—J. SEAR, Steeple Claydon, Bucks.

**GARDENER (WORKING)**, to any Lady or Gentleman requiring the services of a thorough practical Gardener. Fourteen years' experience in the general routine of Gardening. Good testimonials and three years' character.—L. W. P., 31, Gaskell Street, Larkhall Lane, Clapham, S.W.

**GARDENER (SECOND)**, in a good place; age 23.—G. BECKETT, Gardener to J. P. Currie, Esq., can confidently recommend a young man, who has lived under him as above for three years. Thoroughly trustworthy, sober, and very industrious.—J. WORSFOLD, Church View Villas, Park Road, Esher, Surrey.

**GARDENER (SECOND)**, or JOURNEYMAN (FIRST), in the Houses.—Age 23; good references. Nine years' experience.—ALPHA, 494, King's Road, Chelsea, London, S.W.

**GARDENER (UNDER)**.—Age 22. Indoor and Out preferred. Seven years' experience.—H. KING, 18, Grant Street, Halifax, Yorkshire.

**GARDENER (UNDER)**, or otherwise.—Age 23, single; has had eight years' experience in Fruit and Plant Houses, Flower and Kitchen Gardening. Can be well recommended from last and previous employers.—J. B., 49, Richmond Place, Beacon Hill, Bath.

**FOREMAN, or UNDER GARDENER** in a large place.—A GARDENER wishes to recommend a respectable young man (age 24) as above. Good character for upwards of eight years.—GARDENER, The Shrubbery, Fulham, London, S.W.

**FOREMAN**.—Age 26; eleven years' general experience in first-class places. Good references.—FOREMAN, 42, Faulkner Street, Bishop Fields, Chester.

**FOREMAN**, in a good establishment.—W. M. STICKLAND, Hopwood Hall Gardens, Middleton, Manchester, will be pleased to recommend his present Foreman to any Gardener requiring a thoroughly steady, industrious, energetic young man.

**FOREMAN**.—A young Man wishes for a situation as above in a good establishment, under a good Gardener. He has been at the Marquis of Drogheda's, Moore Abbey, for the last two and a half years, and has a fair knowledge of the profession. Is English, and a Protestant.—G. H., The Gardens, Moore Abbey, Monasterivan, Co. Kildare, Ireland

**To Noblemen's and Gentlemen's Gardeners**, FOREMAN in the Houses, in a private establishment.—Mr. W. STIMPSON, Norman Court, Salisbury, will be pleased to recommend to any Gardener a young man as above.

**FOREMAN PROPAGATOR**.—Age 35; twenty-three years' experience in Stove, Hard and Soft-wooded Stuff, Cut Flower Trade, Roses, and Winter Heaths. Abstainer. Good references.—EARL, Cotton Hill, Withington, Manchester.

**To Nurserymen**

**FOREMAN and PROPAGATOR (INDOOR)**.—Has a sound knowledge of the Propagation of Rhododendrons, Roses, Conifers, Clematis, Hard and Soft-wooded Greenhouse and Bedding Stuff.—H. M., Mr. Portman, Prospect Road, Sheepbridge, Old Whittington, near Chesterfield.

**FOREMAN or MANAGER of an Estate**.—Is practically acquainted with all Trades connected with Building; also understands Farming, having served twenty years on one Estate. Can Plan and Design, and Estimate Value of Work and Timber.—GEO. BUCK, Greyhound Lane, Streatham, S.W.

**To Nurserymen and Florists.**

**FOREMAN and PROPAGATOR**.—Age 28; fourteen years' good practical experience in all kinds of Hard and Soft-wooded Plants, well versed in all kinds of Growing and Forcing for the Cut Flower Trade for Market or otherwise. Can be highly recommended. Two years' excellent character. Please state terms.—E. B., Leigh Road, Eastleigh, Southampton.

**JOURNEYMAN**, in a good establishment; age 20.—The Advertiser will be glad to recommend a thoroughly respectable trustworthy young man as above. Four years' varied experience.—C. SANFORD, The Gardens, Chalcot, Westbury, Wilts.

**JOURNEYMAN**, in a first-class establishment.—Age 20; five years' unexceptionable character. Well up in Hothouse Work. Strong, active, and obliging. Premium offered.—H. REKKS, Stoodleigh Moor, Tiverton.

**MANAGER, PROPAGATOR, and GROWER**.—First-class at Ericas, Camellias, Azaleas, and all Hard-wooded Plants, Stove Plants, Pelargoniums, &c.—A. E., Mr. Bridge, Landor Road, Stockwell, London, S.W.

**To the Trade.**

**GROWER, or ASSISTANT in the Houses**.—Twelve years' experience in Soft-wooded Plants in the Market Trade.—J. S., 22, North Kent Terrace, Woolwich, Kent.

**TO NURSERYMEN**.—Wanted by a Man, age 28, a situation in a Nursery. Fourteen years' experience in Plant Growing. Good references.—W. F., Hayden Cottages, Sunninghill.

**SHOPMAN, or SECOND**.—Age 22; five years' experience in the Retail Seed Trade. Good references.—J. P., 8, Dergate, Northampton.

**MANAGER, or BOOK-KEEPER**, in a Nursery, Seed, or Florist's Business.—Age 35, married; first-class references.—Y. Z., 14, All Saints' Road, Westbourne Park, London, W.

**KINAHAN'S LL WHISKY**.  
KINAHAN'S LL WHISKY.  
Pure, Mild and Mellow, Delicious and Most Wholesome. Universally recommended by the Profession. The Cream of Old Irish Whiskies.  
KINAHAN'S LL WHISKY.  
Dr. Hassall says—"Soft and Mellow, Pure, well Matured, and of very excellent quality."  
KINAHAN'S LL WHISKY.  
Gold Medal, Paris Exhibition, 1878; Dublin Exhibition, 1865, the Gold Medal.—20, Great Titchfield Street, London, W.

**DINNEFORD'S MAGNESIA**.  
The Medical Profession for over Forty Years have approved of this pure solution as the Best Remedy for  
**ACIDITY OF THE STOMACH, HEARTBURN, HEADACHE, GOUT, AND INDIGESTION,**  
and as the safest Aperient for Delicate Constitutions, Ladies, Children, and Infants.

**DINNEFORD'S MAGNESIA.**

**HOLLOWAY'S PILLS**.—For Indigestion, Stomach and Liver Complaints.—Persons suffering from any Derangement of the Liver, Stomach, or the Organs of Digestion, should have recourse to Holloway's Pills, as there is no medicine known that acts on these particular complaints with such certain success. They strengthen the tone of the stomach, increase the appetite, purify the blood, and correct depraved secretions. In bowel complaints they remove all morbid humours, and soon restore the patient to sound health; nervous or sick headaches and depression of spirits may be speedily removed by these Pills. They are composed of rare balsams, without the admixture of a grain of mercury or any noxious substance, and are as safe as they are efficacious.

# NOTE THESE BOILER REPORTS.

## BOILERS AT MR. BULL'S. FUEL CONSUMED.

Three Saddle Boilers (*which failed to do the work*) burnt  $21\frac{1}{2}$  Chaldrons of Coke per week.  
1879-80. Two of Weeks's Patent Duplex Boilers, now in use, burn  $9\frac{1}{2}$  Chaldrons of Coke per week.

Clear Gain in Fuel by use of Weeks's Boilers, 12 Chaldrons per week.

### BOILERS at WILTON HOUSE. FUEL CONSUMED.

1876.—COALS (culm), 64 tons 18 cwt., at 22s. per ton	...	£71	7	9
CHALK (the getting), 10 tons, at 1s. 6d. per ton	...	0	15	0
1877.—COALS (culm), 55 tons 17 cwt., at 20s. per ton	...	55	17	0
CHALK (the getting), 18 tons, at 1s. 6d. per ton	...	1	7	0
1878.—COALS (culm), 61 tons 14 cwt., at 19s. per ton	...	58	12	3
CHALK (the getting), 20 tons, at 1s. 6d. per ton	...	1	10	0
Total Cost for 3 years	...	£189	9	0
Deduct value of Lime burned and used in the Garden, 168 quarters at 4s. per quarter	...	33	12	0
Cost of Fuel for 3 years	...	£155	17	0

Or for 1 year, £51 19s. There being 18 compartments, about 33 feet by 12 feet, it costs £2 17s. 8½d. per year, or 1¼d. per day to heat each.

### BOILER at LOWER EATON, HEREFORD, the Seat of JAMES PULLEY, Esq.

At these gardens two so-called "improved forms of Boilers" were tried for two years, and failed. We were requested to remove both, but we suggested the removal of one only, leaving the other for a comparative test by the side of our Duplex of the same size. This was agreed to, with the following result, as given by Mr. Williams, after three years' trial:—"Your patent Duplex will heat the houses much better and with less fuel than the other Boiler. We have therefore discontinued using the latter, and now use your Boiler only."

### BOILERS at Messrs. WOOD & INGRAM'S, HUNTINGDON.

Messrs. WOOD & INGRAM, of The Nurseries, Huntingdon, write as follows:—

"Your Upright Tubular Boilers have been in use at our establishment for many years with perfect success. At the present time we have two, viz., one fitted on the high level in a shallow stokehole, with the top of Boiler 6 feet above its work, the other in an ordinary stokehole, with the apparatus attached in the usual way. Either of these will work with the greatest ease our entire apparatus, consisting of about One Mile of Piping. We use them alternately. The Duplex Boiler on the high level has always and is now doing its work in first-rate style. Many of our clients and visitors have expressed their astonishment at its efficiency when they are informed of the great extent of piping it works so easily, with so small a cost in fuel and labour compared with other Boilers we have before used."

*We are of opinion that no other Boiler can show such a List of Achievements as our Duplex Tubular has accomplished; and having proved the superiority of our Duplex Boiler, we are prepared to challenge any other form of Boiler (not made in imitation of ours) to do so large an amount of work with the same amount of fuel. We are further prepared, for security, to give, when requested, a written guarantee for 10 years with every Duplex Boiler fixed by us.*

Our New BOOK of DESIGNS (15th Edition), considerably enlarged, will be ready for issue in about a fortnight, and will be forwarded post-free on application.

**J. WEEKS & CO.,**  
HORTICULTURAL BUILDERS AND HOT-WATER APPARATUS MANUFACTURERS,  
KING'S ROAD, CHELSEA, LONDON, S.W.

Editorial Communications should be addressed to "The Editors;" Advertisements and Business Letters to "The Publisher," at the Office, 41, Wellington Street, Covent Garden, London, W.C.  
Printed by WILLIAM RICHARDS, at the Office of Messrs. FRADBURG, AGNEW & Co., Lombard Street, Precinct of Whitefriars, City of London, in the County of Middlesex, and Published by the said WILLIAM RICHARDS, at the Office, 41, Wellington Street, Parish of St. Paul's, Covent Garden, in the said County.—SATURDAY, January 24, 1880.  
Agent for Manchester—JOHN HEYWOOD. Agents for Scotland—Messrs. J. MENZIES & Co., Edinburgh and Glasgow.

### BOILER at GIBSON'S HILL, NORWOOD. FUEL CONSUMED.

Mr. ANDERSON, *the Gardener*, writes:—"When I came here seven years ago we had three Saddle Boilers, and the Fuel Account was hard upon ... .. £50 per year.  
—rather over than under—for Steam Coal, now the fuel for your Tubular costs about ... .. 20 per year.

Clear Saving in Fuel ... .. £30 per year.  
And this tubular heats about 3000 feet of piping. I have worked Tubulars now for 12 or 14 years, and have never had a breakdown yet, so I stick to my friends."

### BOILER at the PINE-APPLE NURSERY.

Messrs. E. G. HENDERSON & SON say:—"After the enlargement and additions to our establishment we put down two large improved Saddle-shaped Boilers. Imagine our great disappointment when in the unusually mild winter of 1877-78 we found ourselves with deficient boiler power to work our Heating System. True, the circumstances were somewhat exceptional, the number of the houses to be heated being unusually large, at some distance apart, at different levels, containing nearly two miles of piping, and divided into ninety-five compartments. Still, as the season was so mild, no difficulty should have been experienced in obtaining sufficient heat. However, as the Boilers failed to supply this, it became apparent that we must have additional boiler power, either by fixing a third Boiler of the same type, or by the substitution of another and more powerful one of another pattern. We decided upon the latter course, and having seen some very favourable instances of Weeks' Patent Duplex Upright Tubular Boilers we had one of their large ones, with all the recent improvements, put down and attached to the piping. The result we are glad to say is a complete success, so much so that we have not only been enabled to entirely dispense with the two large Saddle Boilers, but to discontinue the use of mats."

### BOILER at CHALK FARM NURSERY, NORWICH.

Another instance where our Boiler has superseded others.

Number of Houses, 4, each 120 feet long = total length 480 feet.  
Number of Houses, 6, each 100 feet long = total length 600 feet.

Total length of Houses ... 1080 feet.

Total length of piping, upwards of One Mile.

Size of Boiler, No. 5.

Mr. Hannent says:—"I beg to assure you that the Boiler answers every purpose, and I am perfectly satisfied."

Rose 124.

MANGEL SEED.

JOHN SHARPE can offer to the Trade well harvested SEED, and of full growth—Crop 7/8. Samples and Prices of ORANGE GLOBE, YELLOW GLOBE, INTERMEDIATE and LONG RED on application. Bardney Manor, Lincoln.

TREE PLANTING: AN INVESTMENT.

That Timber Growing will be found to be a profitable application of the soil, and a sound investment to Capitalists in the future, is being made obvious by the increasing demand for Wood, and its anticipated scarcity in places abroad.

Nurseries have long been noted in Scotland for successfully and cheaply raising FOREST and other TREES, and the Subscribers devote every attention to conducting efficiently one of the largest establishments in the country.

In connection with their business arrangements Correspondents are respectfully reminded that their Priced CATALOGUES are sent, post-free, on application. The prices are quoted as reasonable as any. Plants are fibrous-rooted, robust, and grown unsheltered. Inspection of Nurseries invited, but if inconvenient, Samples of Trees will be furnished. Planting contracted for, Carriage Rates lessened, and Packages saved by using "Through Trucks." Export Orders carefully supplied, and Correspondence solicited.

BENJAMIN REID & CO.,

**POPULUS CANADENSIS NOVA,** 12 to 14 feet, girding  
 6 inches.  
**MAPLES,** Norway, 12 to 16 feet.  
**BEECH,** Purple, 10 to 12 feet.  
**OAKS,** Scarlet, 10 to 12 feet.  
**CHESTNUTS,** Spanish, 10 to 12 feet.  
**SYCAMORE,** 12 to 15 feet.  
 They have straight stout clean stems, and handsomely  
 furnished well balanced heads, and from frequently transplanting  
 are splendidly rooten. They are without doubt the finest stock  
 of Avenue Trees to be met with in any Nursery in Europe.  
 The girth of the stems is taken at 4 feet from the ground, and  
 not at the base, which is often deceptive.  
**ANTHONY WATERER,** Knap Hill Nursery, Woking  
 Surrey.

**Potato Disease—Potato Disease.**  
**THE FAMOUS SCOTCH CHAMPION,**  
 ACKNOWLEDGED BY EVERYBODY TO BE  
 the best Disease Resisting variety grown.  
*Price List free on application.*  
**QUANTITY OF OTHER VARIETIES.**  
 Applicants will please state quantity and kind required.  
**PUBLIC INSTITUTIONS, HOTELS and FAMILIES,**  
 supplied with Table Potatos.

A Large Quantity of Carrots, Mangels and Swedes,  
 for Horses and Cattle, for Sale.

Westwood Park Late White Broccoli.

RICHARD SMITH AND CO.  
have pleasure in again offering this  
excellent BROCCOLI, and respectfully  
solicit early Orders, as the stock this season  
is limited. Price 1s. 6d. per packet, the  
usual discount to the Trade.

From *The Gardener*, July, 1876 :—"The  
most valuable Broccoli we have seen this  
year is a kind coming into use in June; it is very white, and of  
large size before the leaves expand, and though yet in a private  
garden, we hope to see it comestable by the public. It is growing  
in Westwood Gardens, near Droitwich, and Mr Gough,  
the gardener, has been saving seed from the finest heads for  
some years, and has been rewarded with great success."

## PRICES OF FARM SEEDS.

We beg to remind our Patrons, to whom we had the pleasure to post, early in the month of January, our "Preliminary Farm Seed List," that the low prices there quoted are binding only up to February 20, as therein stated. The exceptional severity of the weather has so injured the Crops standing for Seed that the market values of all sorts of Root Seeds are much enhanced, and it will be necessary to considerably raise the prices of several varieties.

Reading, Jan. 31, 1880.

Now Ready, a Revised Edition of the

## COTTAGER'S CALENDAR OF GARDEN OPERATIONS.

ORIGINALLY COMPILED BY THE LATE SIR JOSEPH PANTON, M.P.

Price 3d., Post Free 3½d.

W. RICHARDS, 41, WELLINGTON STREET, STRAND, LONDON, W.C.

BOILERS AT HUTTON HALL, GUISBOROUGH, YORKS,  
The Seat of J. W. PEASE, Esq., M.P.

Five years ago we received commands to remove a series of Improved Saddle Boilers, which, after repeated trials, during a period of twelve months, were found incapable of doing the work. At the same time we made an addition of 3600 feet of piping, and put down five of our Patent Duplex Upright Tubular Boilers to do the whole of the work, which now consists of 14,000 feet of piping, in two distinct systems. After a five years' trial Mr. McIndoe, the Head Gardener, writes as follows:—

"Respecting the five Tubular Boilers you fixed here five years ago, I have, indeed, great pleasure in saying nothing can be more satisfactory than the manner in which they do their work, and this, too, with an amount of fuel and labour that bears a very favourable comparison with any Boilers I have ever had to do with. As you are aware, there is upwards of 14,000 feet of piping attached to the Boilers, and this heats twenty-seven houses or compartments. They do this most efficiently, and without any pressure. Severe as the last and this winter has been, we have not lost one moment's sleep on account of our Boilers, or falling temperature in the houses. I regret the principle of your Tubular Boilers is not better understood by practical Gardeners and would-be Hot-water Engineers. Were it so there would be a great deal less misery and up-hill work in early forcing."

*New and Enlarged Book of Designs (15th Edition) and full particulars of Boilers sent, post-free, on application.*

THE QUEEN'S SEEDSMEN,

**WORDSLEY, STOURBRIDGE**

THE BEST OF THE SEASON.

**SUTTON'S FLORAL NOVELTIES,**

FREE BY POST.

**SUTTON'S NEW PRIMULA, "RUBY KING."**

Raised by us, and received a First-class Certificate at a meeting of the Royal Horticultural Society on January 14, 1879. Colour quite distinct from that of any other Primula, being of the deepest blood-red, with a well-defined yellow eye; of dwarf habit, with dark green foliage.

*Price 5s. per Packet, post-free.*

**SUTTON'S NEW WHITE PRIMULA, "PEARL."**

A charming novelty, now introduced for the first time; selected from a great number of seedlings raised by ourselves. The flowers are larger than those of our superb white Primula, and even more beautifully fringed; habit, the most perfect of any white Primula yet introduced.

*Price 5s. per Packet, post-free.*

**BEGONIA MONTE ROSA.**

A single variety of the most delicate rose colour. The flowers are immense in size, with all the petals of one uniform shape; habit, very compact.

*Price 2s. 6d. per Packet, post-free.*

**SUTTON'S LARGE-FLOWERED STRIPED PETUNIA.**

Quite a new strain. The flowers are double the size of the ordinary Petunia, and beautifully striped.

*Price 2s. 6d. and 5s. per Packet, post-free.*

**SUTTON'S NEW DWARF STRIPED PETUNIA.**

One of the finest novelties yet introduced in Petunias. Each plant forms a compact and densely-branched bush from 5 inches to 8 inches high, and the same in diameter, covered with brilliant cherry-red blossoms, each of which is marked with a white star.

*Price 2s. 6d. and 5s. per Packet, post-free.*

**PHLOX DRUMMONDI (nana compacta). Chamois Rose.**

By far the most beautiful of all the dwarf Phloxes. The flowers are a pale salmon-rose; the plant grows from 4 inches to 6 inches high, and is covered with a dense mass of flowers.

*Price 2s. 6d. per Packet, post-free.*

**SUTTON'S CYCLAMEN GIGANTEUM ROSEUM superbum.**

This very large and beautiful variety of Cyclamen was awarded a First-class Certificate by the Royal Horticultural Society. The colour is quite unique, a bright rosy-pink.

*Price 2s. 6d. and 5s. per Packet, post-free.*

**ESCHSCHOLTZIA CROCEA, fl.-pl.**

The flowers of this variety are a bright orange-scarlet shading off to salmon-red. Very double and of great substance. It is perfectly hardy and very free flowering.

*Price 2s. 6d. per Packet, post-free.*

**GODETIA WHITNEYI "BRILLIANT."**

A fine variety, with handsome flowers of a rich carmine, shading off to tender rose at the points of the petals. The dwarf and compact habit of growth, combined with its brilliant colouring, makes it very valuable for the formation of showy and effective masses.

*Price 1s. 6d. per Packet, post-free.*

SATURDAY, JANUARY 31, 1880.

ROSES IN POTS.

PERHAPS there is no flower so universally cultivated as the Rose. Living, as I do, in the neighbourhood of London, and coming into frequent contact with the owners of villa and suburban residences, I am constantly asked to give advice as to the best flowers to plant. After advice is given, the soil and site of the garden considered in all its bearings, if the circumstances do not admit of the Rose being mentioned, depend upon it the owner of the garden will anxiously ask the question, whether or not it would be desirable to plant a few Roses. Every lover of beautiful and sweet-scented flowers longs to grow Roses in his garden; he would like Roses such as he has seen at the flower shows, and one scarcely has the heart to tell him that this is impossible. In the first place the soil of many such gardens is unsuitable; next the atmosphere is not sufficiently pure; buildings interfere, and neighbours have shrubs or trees that aggravate other evils. In our own garden the soil is very light, shallow, and resting on a gravel subsoil—the worst for Roses. Under such conditions one is almost driven to the culture of Roses in pots.

During the last twenty-five years very rapid strides have been made in this method of cultivating the Rose. Plants grown in pots are much more under the control of the cultivator, and as regards the potting material, neither Mr. Turner, of Slough, nor Messrs. Paul, of Cheshunt, have any greater advantages than the rest of us. They may have one advantage, but to most growers it is a doubtful one, and that is, the possession of the largest plants in the world. These immense veterans, when in full flower, are worthy of the highest encomiums that can be bestowed upon them, and show what can be done with the Rose under skilful management. They may be magnificent, but they are certainly not more beautiful than a bank of Roses grown to perfection in 8-inch pots, with from six to a dozen well developed flowers on each; and when the flowers are set-off with the varied beauties of healthy rich green foliage, the picture is complete, the mind is satisfied.

Well, says some ardent admirer of the Rose, anybody can grow these small specimens. Not so fast, my friend: anybody cannot grow them. The same skill that produced the large specimens has been lavished on the smaller ones; they have received the same attention, and it is only those who are willing to give their flowers and plants unremitting care who can hope to be successful. There are few more beautiful objects in floriculture than a well grown Rose bush in an 8-inch pot; and those who are willing to give their plants that attention they need will be amply rewarded. To ensure success a good start must be made, and those who have no plants could not do

better than purchase a collection established in 8-inch pots. At the same time a sufficient number of small plants in 5-inch pots should be obtained to succeed them. The plants may be worked on the Manetti stock, the Brier, or on their own roots. The last method of propagating Roses is not often resorted to now, but many varieties give grand results on their own roots. Perhaps the largest proportion of those obtained through the trade are worked upon the Manetti, and such Roses are well adapted for early forcing.

One point gained in pot culture is the advantage of obtaining early flowers. The last Rose of summer is interesting enough, but it is often a poor mouldy thing, whereas the first Rose of spring inspires us with redoubled ardour as it slowly unfolds its beauties in a warm greenhouse. For early forcing I like the plants to be established in their pots by the end of September; indeed they ought to be potted into their flowering pots early in August. The compost should have been prepared, say, two months previously to potting, and it should neither be too rich nor too dry at the time. The reason for mixing the compost so long before potting is to allow of its being well incorporated together. Take of rotted turfy moderately clayey loam four parts, one part of decayed manure (I like to use cow and horse-manure in equal portions), add to this a 9-inch potful of  $\frac{1}{4}$ -inch bones to each barrowload of compost, and probably some sand should the loam be too adhesive.

In repotting it may be necessary to carefully remove some of the old soil with a pointed stick. If there is a good ball of healthy roots less will need to be removed. If a plant has not made many roots it may be repotted in the same sized pot; a healthy plant well furnished with roots must be placed in one at least 2 inches wider. At the time of potting the plants will be in full leaf; they should be placed out-of-doors as they were, but made quite secure from winds, and be syringed twice daily to prevent flagging at first. Tea and other tender Roses should be placed under glass after repotting. While the Roses are making their growth they must be kept quite healthy; no greenfly must suck the juices—the very life of the plants; the breathing pores must not be choked by the orange fungus or the insidious mildew; red-spider must also be watched for. The best way to destroy the above is to lay the pots on their sides, and well syringe the leaves underneath with soft-soapy water, to every two gallons of which has been added a quarter of a pound of flowers of sulphur.

Careful watering is another prime agent in successful culture. When the plants are exposed out-of-doors it is necessary to look over them twice a day in hot, dry weather. The leaves must be kept bright and clean until they drop naturally. When the leaves fall off the plants must be placed under cover, and those intended to be placed first in the forcing-house should be pruned as soon as they are rather dry at the roots. The wounds speedily heal when the stems are not charged with sap. The cut portions may be painted with styptic, to prevent bleeding. Give a good watering at the roots when the wounds are healed; the Rose should never be dried up at the roots—these organs are always active unless they are dried up or frozen. The first week of the new year would be a good time to place the first selection in the forcing-house. This should be a light, airy structure, and the plants must be placed near the glass. If the pots can be placed over a bed of fermenting material, not plunged in it, so much the better. The heat from the fermenting material causes the roots to act with the tops, and the moisture from it is conducive to vigorous development.

In a temperature of 45° at first, or even 50° when it is mild out-of-doors, the buds will soon

start, and as growth progresses let it be raised to 55° and 60°. I certainly do not like a higher temperature than 60° as a minimum for the Rose, and even at that it is better to have a "notch" of air on all night. In very severe frosts it would be most undesirable to over-heat the pipes to obtain 60°: better to let the temperature fall below 55°. Some varieties produce too many shoots, others not more than enough. It will be necessary to thin out the weak ones when there are too many. This may be done when they are 6 inches long, else the growths will be drawn up weakly, and the flowers are certain to be inferior. When the growths are fairly started and numerous young roots are being formed, manure-water should be applied once or twice a week. Half a bushel of cow-manure soaked in 20 gallons of water is excellent for the purpose. The manure should be well stirred up in the water, and it should be allowed twelve hours to settle before using it. Paul's Rose manure is easily applied, and I have proved it to be very efficient in promoting strong healthy growth, always the precursor of well-formed full-sized flowers. A small portion of the manure is spread on the surface of the soil, and repeated waterings with clean rain-water speedily wash it out of sight. Gently dew the plants overhead daily, as well as moistening the paths and walls of the house.

The Rose also delights in pure air, and the ventilators must be opened whenever it is possible to do so without reducing the temperature. Many of the plants will require no sticks to be placed to the flowers; others require that each flower be supported with a neat stick. If they have to be removed any distance to an exhibition, or for any other purpose, a stick must be placed to each flower. Osiers with the bark left on are as good as any other. They are cheap, easily cut, strong enough to support the flowers, and last for one season. More expensive sticks often do no more than this.

Many persons would doubtless like to have a list of the best varieties for pot culture. The following are the best for growing into large specimens:—

Charles Lawson  
Juno  
Miss Ingram

Paul Perras  
Paul Verdier

The above are hybrid China or Bourbon: the following are hybrid perpetuals:—

Annie Alexieff  
Alfred Colomb  
Annie Laxton  
Avocat Duvivier  
Beauty of Waltham  
Camille Bernardin  
Charles Lefebvre  
Comtesse de Serenye  
Duchesse de Vallombrosa  
Dupuy Jamin  
Dr. Andry  
Duchesse de Caylus  
Duke of Edinburgh  
François Fontaine  
Général Jacqueminot  
Horace Vernet

John Hopper  
La France  
Madame Clémence Joigneaux  
Madame Lacharme  
Madame Laurent  
Madame Thérèse Levet  
Madame Victor Verdier  
Marie Baumann  
Marie Rady  
Marquise de Castellane  
Princess Mary of Cambridge  
Victor Verdier  
Noisette Céline Forestier

The Teas also form handsome specimens; the best of them are:—

Adam  
Madame de St. Joseph  
Madame Lambert  
Madame Margotin

Madame Maurin  
Madame Villermoz  
President  
Souvenir d'un Ami

The following varieties have been grown and exhibited in small pots by Messrs. Paul & Son, of Cheshunt, and Mr. Charles Turner, of Slough, and are all well adapted for this purpose:—

Abel Grand  
Annie Laxton  
A. K. Williams  
Annie Wood  
Baronne Hausman  
Baroness Rothschild  
Captain Christy  
Centifolia rosea  
Charles Baltet  
Duc de Montpensier  
Duc de Rohan  
Elie Morel  
Elizabeth Vignerot  
Emily Laxton

Fisher Holmes  
François Michelon  
John Stuart Mill  
Julie Touvais  
Madame Gabriel Suizet  
Madame Laboulaye  
Marchioness of Exeter  
Marguerite de St. Amand  
Marquise de Mortemart  
Monsieur Noman  
Princess Beatrice  
Sénateur Vaisse  
Star of Waltham  
Thomas Mills

‡ The above are 'hybrid' perpetuals. Caroline Kuster Noisette suits admirably small pots; and amongst Teas the following are singled out as the best:—Anna Olivier, alba rosea, Catherine Mermet, Jean Ducher, Le Mont Blanc, Marie Van Houtte, Niphotos, and Perfection de Monplaisir. J. Douglas, Loxford Hall, Gardens, Ilford.

## New Garden Plants.

*LÆLIA ANCEPS VESTALIS*, n. var.

*Lælia anceps* is inexhaustible in her surprises. I have at hand a glorious flower, with an emarginate middle lacinia of the lip and very broad petals, the last feature doing very much to increase the reputation of the species, whose varieties with narrow petals give me a rather unfavourable impression. With very few exceptions the colour is the finest white. The median nerves of the sepals are keeled and greenish outside, the tips of the sepals green. The lip has not the purple apex of *Lælia anceps Dawsoni*. The callus, disk, and bases of the side lacinia are of a rather deep sulphur colour, very shining, and the basilar parts of the side lacinia of the nerves have a rather dark violet-purple tint. Column white, with light green at the base and some very light nearly vanishing mauve lines under the stigmatic hollow. The texture is as firm as possible, far more so than I have ever seen it in any of the purple varieties. This glorious novelty has just flowered (January 15) at Burford Lodge, Box Hill, Dorking, in Sir Trevor Lawrence's celebrated collection. H. G. Rehb. f.

*CYMBIDIUM MASTERSII*, Lindl.

There is great pleasure felt in England now about that lovely *Cymbidium Mastersii*, with purple, or violet, or mauve spots and blotches on the anterior lacinia of the lip. The most enthusiastic lover of this plant compared it to *Lælia anceps Dawsoniana*. That is a question of taste. I have several correspondents who grumbled (in the bad month of November) that the "variety" had no especial name.

I am sorry I cannot follow that order, as, *candido lector*, very many names are prescribed. A glance at the two oldest representations (Lindley, *Bot. Reg.* 1846, 50, and Lindl., *Paxton's Flower Garden*) gives evidence that those were blotched with purple, or mauve, or violet. Hence the second variety, now regarded the "old one," because the oldest is forgotten, with white flowers, and only yellow on the middle lacinia of lip and keels, might be distinguished as the *C. Mastersii album*.

Those two representations well show the keels with notches towards their bases. This I regard the characteristic feature of *Cymbidium Mastersii*. How far *Cymbidium affine*, Lindl., may be kept as a good distinct species, owing to the want of those notches, the straight upright raceme, &c., we have to learn as yet. I have addressed many of my English correspondents for elucidation, but the question is not settled, and in various cases I have expressed my doubts. At all events, violet anterior spots occur in both.

I have also had a nice flower of *Cymbidium Mastersii* from Mr. E. S. Williams, sent on November 29, 1879, quite *Mastersii*, but with a rather narrow middle lacinia. I understand from my excellent correspondent that there was an inclination expressed by several Orchidists to regard it as distinct. We have before to learn whether it is a single distinct break, whether it will be constant and appear in more numerous specimens. There is a certain danger in describing individuals as varieties, and many a variety described in our books and journals may be merely an individual aberration. Just there is the difficult point in garden botany, that one has to decide immediately for practical reasons well known to our readers, especially to those who are in the trade. H. G. Rehb. f.

## CLASSIFICATION IN GARDENS.

I FIND that a suggestion which I made some time ago in the *American (Albany, N.Y.) Country Gentleman* has called forth some remarks from the Editor of the *Garden*, and as my excellent friend the Editor of the *American Gardeners' Monthly* has previously favoured me with very similar views, I propose to endeavour very briefly to explain exactly what I mean, and for that purpose I enclose a rough sketch (see fig. 25) of a private garden with the collection grouped in classes and alliances, mainly after the system adopted in the *Genera Plantarum* of Bentham and Hooker.

The groups are apportioned, as to size, &c., to the possibilities of the climate of the Northern United States. For instance, Monocotyledons would be almost entirely destitute of arborescent representatives

FIG. 25.—PLAN OF A PRIVATE GARDEN DESIGNED TO CONTAIN A SELECT CLASSIFIED COLLECTION OF PLANTS.

The five main plots are intended for (I.) Polypetalous, (II.) Monopetalous, (III.) Apetalous, (IV.) Monocotyledonous, and (V.) Coniferous plants respectively, the separate families having each its special position in the appropriate plot. The other references are—A, Mansion; B, Conservatory; C, Flower garden; D, Offices; E, Winter flowers, planted out during summer; F, Propagating houses; G, Sheds; H, Grass; I, Gardener's house; J, Kitchen garden; K, Small fruits; L, Orchard for dwarf trees; M, Grass drying ground; N, Stables; O, Fowls; P, Compost. Scale, 12 feet to  $\frac{1}{2}$  of an inch.

in this climate; the plan therefore assumes the grouping of Palms, arborescent Ferns, Aroids, &c., among the Conifers during the summer; so also with Euphorbiales, Rubiales, Ficoidales, Geraniales, &c. These would be supplied either in whole or in part from the glass department for summer embellishment.

I may mention in illustration that Polygalales are supposed to be represented by plants of Pittosporum

Tobira, planted out during summer. Caryophyllales are represented by a group of Tamarix (Tamariscinæ), and beds of Portulaca (Portulacæ). In Malvales, the three orders, Malvaæ, Sterculiaceæ, and Tiliaceæ, afford plenty of material of all kinds, and if a "position" cannot be found to suit a particular plant, why then a plant must be found to suit a particular position; and I would suggest that this latter is the

"practical" method in nearly all the climates I have lived in.

I feel sure that it will very readily be seen that there is quite a possibility of finish and taste and "gardenesque" perfection, coupled with quite a good deal of instructive classification, in this idea; and I am sure that the Editor of the *Garden* ought to hail with delight any suggestion of this kind, seeing how he

deploring the yards upon yards of ribbon beds which, in spite of all his efforts, are still the prevailing fashion.

The garden plan is suited to the requirements of a retired American gentleman of horticultural tastes, small family, and ample income. The kitchen garden, &c., is small, the main features being a classed arrangement and abundance of glass for the production of flowers in the winter. *James Matherson, Rochester, N. Y., U.S.A.*

## WATER CRESSES FOR WINTER USE.

THE twelve pans of Water Cresses shown by me at South Kensington on the 13th inst. were regarded by the practical men present as usefully illustrating the value of this culture for the supply of the table during winter. The tremendous frost that broke up at Christmas made an end of Cresses in all the brooks and beds that were not specially protected, and in many that were aided by flooding, for the frost went deep into the water, and when the thaw came it was found that the crop was gone, and there could be no more gathering until returning spring should bring new growth. A very slight touch of frost destroys the crop, and, this accomplished, there is no more production until the spring returns, and a vigorous new growth accompanies the rise of temperature. At Bridge House we never obtained outdoor Cresses even from the brook in the sheltered garden before the middle of April, at which time we used to turn out into the brook the pans of Erfurt Cress that had been grown under glass, so as to naturalise the variety without losing its distinctive qualities. When the Erfurt Cress becomes established its character is pretty well washed out of it in the second season, but by raising a fresh stock every year from seed for pan culture, and turning the pans out when their winter work is done, the Erfurt is maintained in its integrity for use during the summer and autumn; and this is the best way to ensure supplies of this elegant and delicate variety all the year round.

The pan system is the best for the supply of winter Cresses for home use, but is altogether unsuitable for commercial purposes. For the supply of the market larger plans are required, and of many that are possible there are two that demand special attention. One of these consists in arranging the levels of the water-flow, so that in expectation of frost a flush of 2 or 3 inches of water may be run over the bed to bury the crop and keep the frost at a safe distance. Where there is a sufficient head of water the main business is to employ it judiciously, and to be always in good time. Thus a crop may be carried through a severe winter, and when not actually frozen over may be gathered from for the market.

Another effectual plan is to have the winter beds flanked by banks, on which large lights may be laid, and such things as old doors and shutters and hurdles and mats may be employed, for loss of light is of little consequence to plants that have ceased growing, and are but standing still to be ready for gathering. That the two systems may be combined will be evident to the practical man who is in any way interested about the supply of Cresses during the winter. The crop of course should be grown for the purpose by the insertion of cuttings, in August or early in September.

The Cresses shown at South Kensington on January 13 were six weeks old from the cuttings. They were sufficiently grown to be cut from for the table at four weeks from the cuttings; but it is a bad practice to cut until the plant is quite strong and able to bear it, and a small quantity only should be taken from one pan at a time; hence half a dozen pans at least should be grown, and much better a dozen; and better than all pans are large troughs and boxes that afford abundant root-room, for we cannot have too much vigour of growth; as a matter of fact, we always have too little. Mere protection from frost is quite enough in the way of house accommodation, for while the plant is soon killed down by frost, it fares almost as badly under artificial heat. Hence a good brick pit, with a slight service of hot-water piping, answers admirably as a winter Watercress garden. Those exhibited on the 13th were grown in a light airy house occupied with bedding plants. The pans were all placed in "stands" or water pans, to keep the Cresses well fed with water, and they were all as near the glass as we could conveniently place them. In the first instance the pans were filled

with strong loam, mixed with a small allowance of Clay's Fertiliser, and the cuttings consisted of the smallest tops of strong Cresses of outdoor growth. As for after-management, it may be said there was none, because none was wanted. They were treated to an occasional shower from the syringe, but would probably have done as well without it, for the truth is Watercress culture is about the easiest business in the world, and when I hear of failures I always conclude that there was a radical mistake in the first start. I have never seen aphid or thrips on the plants even when kept too dry, and although many cruciferous plants are subject to mildew, as witness the Shepherd's Purse and the Kerguelen Cabbage, I have never seen the slightest trace of mildew on Water Cresses.

Although a strong heat is never needed in the ordinary way in the cultivation of this elegant vegetable, it is nevertheless possible to force Water Cresses advantageously, as a case in point will show. There was a sudden demand here for a large lot of home-grown Cresses for a particular purpose, and our stock was by no means up to the mark. This happened when the frost was raging, and Nature was dead against any magic in plant growing. But we were equal to the emergency. We managed to secure a peck or so of cuttings from our neglected pans, and these were inserted in pans newly prepared with good fresh loam and Clay's Fertiliser, and there were a score of pans thus prepared to begin with. As we had but three days for the entire business, you may imagine that if old Death had put his head in at the door we should probably have made a cheap bargain with him to be out of the difficulty. But he did not appear, and we had to go on. The pans were put into a moist heat of 70°, and within three days there was a rich growth of about 4 inches, and we cut a bushel of the loveliest home-grown Cresses ever seen or tasted. After this the plants sprouted weakly, and we made another cut at about eight days from the first, and then threw them away as worn out. The forcing soon ruins the plant, but in the event of an emergency a temperature of 70° will do wonders. *S. H., in the "Gardener's Magazine."*

## LILIUM PARRYI.

HAVING had the honour of introducing, as well as the good fortune of first growing and blooming, this beautiful and rare Lily, both in pots and in the open border, a few brief memoranda, giving the results of my experiments on this subject, may perhaps be of some interest to your readers.

In the fall of 1877 my kind and generous friend, Dr. C. C. Parry, divided the only four bulbs he had between Professor C. S. Sargent, of the Harvard Botanic Gardens, and myself. In this way I became the fortunate recipient of two medium-sized bulbs. As the season was already too far advanced, and the weather wet and cold, I found myself compelled to abandon the idea of outdoor planting, and to limit my experiments for that year to pot culture. The two bulbs were each planted in a 5-inch pot, in a compost of one part leaf-mould, two of good friable turfy loam, one of well rotted cow-manure, and one of sand. After planting the pots were plunged in a well protected cold pit.

One of the bulbs never made its appearance above-ground, and finally rotted away; the other, however, showed signs of growth towards the end of February, 1878. The plant grew very slowly at first. When the stalk was about 5 inches above-ground the plant was carefully shifted into a large 6-inch pot, with most of the fresh soil on the top. Towards the middle of May it was plunged, together with about seventy other Lilies of various kinds, in a warm and well-protected border. Here the plant grew to a most remarkable perfection, having two distinct whorls of leaves at the base of the stalk, which latter stood 3 feet 2 inches above the top of the pot, and produced four perfect buds. When these buds were just beginning to colour up, the top of the plants, and with it all the buds, was broken off by a severe tornado, thus destroying all hopes of blossom for that season.

In the fall of 1878, through the kindness of Mr. F. M. King, of Banning Station, Cal., I obtained several hundred bulbs of this Lily. They were all distributed among many botanic gardens, correspondents and friends, except one dozen which I retained for experimental purposes. Four of these were planted in pots, the remaining eight in the open border. The four selected for pot culture were planted singly in 4-inch pots. After planting, the pots were

plunged into a sand-bed in my cellar, where they were left until they showed the young shoots above-ground. When about 6 inches above-ground all were shifted into 6-inch pots, with most of the fresh soil on the top. They were grown and bloomed in a temperate conservatory facing the east.

The eight bulbs chosen for outdoor culture were planted the latter part of October, 1878, in a bed devoted exclusively to the culture of Lilies. All were planted from 9 inches to 10 inches below the surface. During winter a good covering, 6 inches thick, of dry Oak leaves was brought on to the bed. (Lowest temperature during winter 1878-79 was from 20° to 25° below zero for about a week and a half.)

The following are the results of my observations, all carefully noted down at the respective times of making them:—

I. IN POTS: *Bulb No. 1.*—This was the finest bulb of the twelve. It was planted in a compost of two parts good turfy loam, one of leaf-mould, one of old rotten cow-manure, and one of sand. The stalk stood when in full bloom 2½ feet above the pot, and produced four perfect flowers. The first opened on May 11, 1879, the second on May 18, on which day I had a visit from its distinguished discoverer. The four flowers were all open on May 25, each lasting about ten days. This plant ripened one seed-pod. After the seeds were taken off I examined the bulb, and found it in excellent condition, having increased to three times its original size, being very firm and of good colour.

*Bulb No. 2.*—Planted in a compost of two parts peat, one of leaf-mould, one of turfy loam, and one of sand. The stalk grew finely to a height of 20 inches, making two perfect flowers. Both were artificially fertilised, but failed to develop pods. After flowering I found the bulbs entirely gone, leaving a nest of four small bulletts behind of the size of a Pea.

*Bulb No. 3.*—Compost same as No. 2. The stalk grew 2½ feet high, making one very perfect flower. After flowering I found the bulb gone, as No. 2, leaving no trace whatever.

*Bulb No. 4.*—Planted in a compost of two parts peat, two of turfy loam, and one of sand; the stalk grew 2 feet high, with three flowers. After flowering I examined the bulb, and found it in a very fair condition, having slightly increased in size and improved in structure.

II. IN OPEN BORDER: *Bulb No. 5.*—This bulb was planted in an open space, exposed to the full sun, in a good open turfy loam, which had been the previous year well intermixed with very old rotten cow-manure. A good mulching was placed over the ground around this plant to keep the ground cool. The thermometer stood for several weeks from 95°—100° in the shade. The stalk grew to a height of fully 3 feet, having one perfect whorl of leaves at the base, and produced nine perfect flowers, lasting in all twenty-four days. This bulb I took up shortly after blooming, about the middle of September, and found it had increased to about four times its original size. It was sent to Mr. Max Leichtlin, who afterwards reported its arrival in excellent condition.

*Bulbs Nos. 6, 7, and 8.*—These were all three bulbs of medium size. They were planted in a peaty soil in an exposure of partial shade during the hottest part of the day. All three produced healthy stalks, from 16 inches to 20 inches high, making respectively one, two, and two flowers. In lifting the bulbs in the fall, I found them to be almost as weak and fragile as when originally planted.

*Bulbs No. 9 and No. 10.*—These were the smallest of the lot; they were planted in a sunny exposure in three parts of turfy loam, one of very old cow-manure, and half of sand. These two bulbs threw up their shoots fully two weeks later than the previous ones. Both, however, made good growth as to size and colour of stalk and leaves, with four and five flowers respectively. In the autumn I examined the bulbs and found both in remarkably good condition, weighty and solid, and increased to at least three times their original weights.

*Bulb No. 11.*—Planted in a peaty soil in a deep shade, receiving only a few stray rays of the sun. The plant came up late, and opened its two flowers a month later than Nos. 9 and 10. In the fall the bulb could not be found.

*Bulb No. 12.*—This bulb was planted in close proximity to a *L. Brownii* in a much sheltered and shady part of the bed, in the common soil (good turfy loam). It

made its appearance above-ground more than a week later than No. 11, and developed its stalk to a height of fully 4 feet, making five perfect flowers. The contrast of this graceful plant, with its delicate pure yellow fragrant bells, and the stately Brownii, in company with two auratum, two Hansoni, and several of the speciosum group, all blooming at the same time, was indescribably beautiful; and the memory of the Sabbath morning, when the last of the comers, the Brownii, opened, the Parryi having then four perfect flowers open, will never be forgotten.

In summing up the above results I have arrived at the following conclusions:— The soil best suited for a healthy growth and perfect development of flowers and bulbs is a good friable turfy loam, with perhaps some well rotted cow-manure and sand sparingly worked in. They will do well in a sunny exposure if the surface of the soil is protected from the sun's rays and kept cool. In an exposure of partial shade the flowers will last from two to four days longer than in the full sun.

The advice given by Dr. Alex. Wallace, recommending deep planting for all Lilies, I have followed in all the above experiments with excellent results. *W. Otto Gronen, C.E., Rock Island Arsenal, Illinois, U.S.A., January, 1880.*

[To this letter, for which we express our thanks to Mr. Gronen, we append the following account of this little-known Lily from Mr. Elwes' monograph. EDS.]

"Parry's Lily was described by Professor Watson from specimens collected by Dr. Parry early in July, 1876, in a marsh in San Geronio Pass, San Bernardino County, South California. It appears to belong to the type of *L. Washingtonianum* more than to any other Lily, though I am not sure whether either of these plants can properly be included with *L. longiflorum*, &c., in the Eulirion section. The bulbs, as far as I can judge from the excellent drawing [of Mr. Gronen], seem to be of a type intermediate between *L. Washingtonianum* and *L. pardalinum*, though the affinity of the plant is certainly with the former species. It may be that its bulbs, from growing in a marshy situation, have become somewhat modified in form. I am not aware that any variety of *L. Washingtonianum* has been found so far south as the San Bernardino Mountains, which lie in about lat. 34° N., on the borders of the desert country which lies between Arizona and the sea. I am indebted to Mr. Duncan Putnam for the following extract from Dr. Parry's account of the plant:—

"In one of my last botanical excursions in the vicinity of San Bernardino, in July, 1876, I accepted an oft-repeated invitation to visit the intelligent brothers, J. F. and F. M. Ring, in their retreat near San Geronio Pass. Leaving the broad and picturesque basin of the Santa Anna Valley near the emergence of the stream from the rugged mountain wall of the San Bernardino range, our route, after crossing Mill Creek, hugged the foothills bordering the Upper Yucaipa Valley; thence, by a more rapid ascent in a nearly direct easterly course, we reached an elevated bench scattered with Pine and Oak groves, overlooking the broad sweep of the San Geronio Pass, now traversed by the eastern extension of the South Pacific Railroad. In one of these mountain nooks, the Messrs. Ring have located a Potato ranch, the elevation of over 4000 feet giving a sufficiently cool moist climate, while the adjoining mountain slopes afford an extensive summer cattle range long after the herbage of the lowlands has dried up.

"In scattered groves of *Pinus Coulteri* the ground was strewn with the massive cones of this peculiar species, its dense scales armed with formidable hooked spines. Many of the cones were fully 6 inches in diameter, with a length of 9 inches.

"The few perennial watercourses here met with are mostly confined within deep and inaccessible ravines, but more frequently scanty springs ooze out from beneath deep layers of porous strata, and spread out into boggy marshes, generally choked up with rank Willow and Alder growths, and occasionally expand into small meadows of coarse grass and sedges. On all the steep gravelly slopes adjoining these was the usual display of Californian evergreen shrubbery, including the heath-like *Adenostema*, which, under the name of "chamisal," is largely used for fuel; the Holly-leaved Cherry (*Prunus ilicifolia*), exhaling a strong odour of bitter Almonds; the *Heteromeles arbutifolia* with glossy varnished leaves, and a prevalent form of California Lilac (*Ceanothus crassifolius*), with thick leathery foliage. The dull green hue which everywhere characterises the moorish growth, is at this time of year partly relieved by brilliant scarlet festoons of *Pentstemon cordifolius* trailing over adjoining bushes, or the less showy blossoms of *Pentstemon ternatus*.

"But what soon attracted more exclusive attention was a conspicuous yellow Lily growing abundantly on the boggy ground adjoining Messrs. Ring's house, and sharing with the Potato patch the care and attention of the undisputed possessors of the soil. Though not so showy as some other members of the Lily family in this region, there is a grace displayed in its large drooping flowers surmounting a slender stem beset with narrow scattered leaves, which are occasionally crowded at the base into a distinct whorl."

"The Lily in question has not yet been introduced into Europe, but is in cultivation in the Botanic Garden of Harvard University." *Elwes, Mon. Lil., part vi.*

## ART IN THE CONSERVATORY AND GREENHOUSE.\*

(Concluded from p. 106.)

### FORCING-HOUSE.

THE forcing-house is used, as its name implies, for forcing on plants, &c., before they are placed in the conservatory or other plant-houses. It is usually fitted with beds having pipes below them to heat the soil with what is called bottom-heat, and fig. 1, p. 140, gives a section showing how the arrangements may be advantageously carried out. The beds are made with iron pillars supporting slates which form the bottom of the bed, the same material being used for the sides and ends. The air-flues are formed in the wall of the building, and are so arranged in conjunction with the slate trough, so to speak, which carries the bed, that the heated air may pass up in the front as well as the back, fresh air being admitted below in a flue, or air-drain running from end to end, and which can be regulated at will. By this means the house can be supplied with fresh heated air when it is not desirable to open the front ventilators. And here it may be said that the most usual way of ventilating buildings of this kind is by allowing fresh air in at the lower portion of the building, either by an air-drain or by front ventilators, as shown in fig. 1, which, in some cases, are also repeated below the lights in the brickwork in the form of wooden doors or flaps. The heated and vitiated air is then allowed to pass off at the apex of the roof by lifting lights worked from below. Any system which admits fresh cold air over the whole surface of the roof equally does not practically do the work so well, simply because no draught is set up, as is the case in buildings such as I have described; and in very windy weather, much cold air which is not wanted must find its way into the building, when so many small ventilators exist all over the roof, a good number of which must necessarily soon fail to fit exactly as they may do when first fixed. With regard to the pipes being carried on bearers above the ground instead of their being buried in the soil, as is sometimes done, it is worthy of note that by this means they are less subject to moisture, and less liable to corrode. For forcing-houses, about 1 foot of 4-inch pipe to from 15 to 16 cubic feet of air will be found a good proportion.

PROPAGATING-HOUSES are very similar to those last described, but are fitted with striking boxes in addition to the beds; and this class of house is also suitable to Cucumber and Melon growing when provided with wires and frames, as shown by fig. 1, on which the plants may grow.

### PEACH-HOUSE.

My diagram, No. 2, p. 140, gives a good section for Peach-houses, which are frequently narrow lean-to structures, from 8 feet to 14 feet wide, devoted to growing this beautiful fruit. A curved-wire trellis (fixed on a pivot to lift up and down, bringing the fruit near or not to the glass) is provided in the front, as will be seen, on which to train the trees, and the back wall may be wired for other fruit. It will be observed in our section that the front is constructed with iron uprights or muntins, let into rough blocks of stone at the foot. Pockets cast on these uprights receive slates about 3/4 inch thick and about 6 inches deep. The rafters are secured to a bracket-head at the top, and provision is also made for the plate which carries the gutter. Thus a building is erected without brickwork, except for the back wall, and I am told that there are many competitors for the credit of having introduced slates into the construction of houses of this kind. The trussed rafter is used for the purposes of lightness, and the tension-rods are useful for creepers to grow over, and for fixing other wires, for the same reason.

### ORCHARD-HOUSES.

Orchard-houses may be like the last, but are generally span-roof structures of about 30 feet wide, the height being in proportion. The trees are planted out in the soil, as they would be out-of-doors, care being taken to leave openings in the external walls under the surface, as in the Peach-house, fig. 2, p. 140, where blocks of stone are used, or by means of arched bricked walls, so as to allow the natural moisture of the earth from rains to permeate the soil-beds inside the building. Orchard-houses are often unheated, but sufficient pipes to keep out the frost should be provided.

### VINERIES.

Vineries are the most usual form of fruit-houses, and are made of various forms. Three houses are necessary if Grapes are wanted all the year round, and if it be intended to grow the fruit in the greatest perfection. One house for the earliest crop, one for the summer crop, and another for the autumn and winter crop. In large establishments this division is still further carried out, various kinds of Grape being grown in different houses, and under varied treatment. The best form for a vinery is the span-roof, provided it be properly ventilated at the apex, to let out the superabundant heat that accumulates there. If early Grapes are intended, then the border must be entirely inside; but for a general crop, in order to give the Vine a large pasture, the walls are built on arches as already described, additional borders being provided outside, or in some cases the Vine may be brought through the wall, its root being planted entirely outside. The best aspect of such a vinery should be east and west. It will then have the benefit of the sunlight from the morning to the evening. Frequently circumstances allow but little choice in the aspect of glass buildings; but for the most part, and especially for lean-to houses, the south-eastern aspect is decidedly preferable to any other, whether they are intended for growing fruits or flowering plants. The sun's rays in the morning are more strengthening and exhilarating to plants than at any other period of the day, and the rays of the evening sun, which may be lost if the building face the south-east, are of very little importance compared with the cheering beams of early morning, and it has been found, generally speaking, that plants are more prostrated by the influence of the afternoon's sun, when it is most powerful and oppressive, than at any other time. Vineries are frequently built against a wall either as lean-to or half-span buildings; they are generally built so for early vineries, as they are warmer than span roof houses. For early vineries the proper amount of pipes is about 1 foot of 4-inch pipe to 20 cubic feet of air, the proportion for late vineries being 1 foot to from 25 to 30 cubic feet.

### PINE PITS.

Vineries are similar to forcing-houses, but the beds are deeper in soil, and the lower part of the roof lights is made to slide so that the plants may be lifted out at pleasure, which is often a great convenience when the house is full. The hot-water pipes are of course in all the foregoing strictly speaking working houses, heated by boilers over furnaces fed with coke or small coal fires, but in ornamental buildings or those connected with the dwelling-house, the heating may be advantageously effected by the use of gas and air, provided, of course, that the furnace be entirely external to the conservatory. Mineral oil stoves are sometimes used for small glasshouses, but not, I think, with much success. Half measures generally are little better than failures.

The sections which I have given in my diagrams, Nos. 1 and 2, p. 140, are simply and entirely devoid of all attempt at anything beyond practical utility; they only present the necessary elements of such buildings. My other pen-and-ink perspective drawings, with plans, show how they may be made more in keeping with a simple artistic idea. Other architects have not failed to grasp the necessity of rendering their designs for similar structures with appropriate architectural treatment; but the instances are by no means numerous, though I should be sorry to ignore anything which has already been done in that way.

### THE PALM STOVE AT KEW.

One of the earliest large buildings which still remains among the most important yet erected in England, is the celebrated and well-known Palm-stove in the Royal Botanic Gardens at Kew. It was built some thirty years ago, from the designs and under

the direction of Mr. Decimus Burton, F.R.S. Mr. Burton, the architect, has most kindly lent me a copy of all the working drawings of this building, and I am thus enabled to show a general plan by fig. 3, p. 141, with a general cross section through the centre of the building by fig. 4, and some details of the construction by figs. 5 and 6. [We are indebted to the courtesy of the *Building News* for permission to use these blocks. Eds.] It will be seen that the entire length of the structure is 362 feet; the centre is 100 feet wide, and 66 feet in height; the wings 50 feet wide and 30 feet high; wrought-iron was used for the ribs of the roof, in lengths of about 12 feet, which were welded together to form the required lengths, and then bent to the proper curve of the rib. Cast-iron sockets receive the ribs; these sockets are sunk into granite blocks, upon a foundation of concrete. The cast-iron columns and the standards over them are hollow, and conduct the water from the gutter cornice of the upper roof into ran-water tanks, under the stone tables all round the entire interior, and these troughs are arranged here so that the water may be warmed by the temperature of the building before it is used for watering the plants—a necessity I have already pointed out. Fig. 5, p. 141, shows a section of the main gutter cornice, and it illustrates the provision intended to carry off the condensed water of the interior, which, owing to the great quantity of iron surface, in cold weather is very considerable. I last visited this building during one of the sharp frosts of the very severe weather which prevailed during the early part of last December, when a perfect rush of water was falling from the continuous gallery which runs round the central area of the house. The Board of Works had, at that time, not completed the intended alteration by which provision was to be made for the carrying off of this condensed water by means of a pipe from the above-mentioned gallery, where it collects in great quantities. An opening had merely been pierced in the gallery floors to receive the pipe, which was not then fixed, and hence, probably, the rush of water to which I refer. The building is heated, it seems to me, in the most perfect manner; no less than 19,510 feet of hot-water 4-inch piping being carried over the entire ground area of the building. This work was designed about three years since by Mr. E. G. Rivers, C.E., and executed by Messrs. Simpson & Co., of Pimlico.\* Six large nearly horizontal tubular boilers are arranged in the basement, three at either end; two boilers being simply provided as a reserve in case of repairs in the others being necessary, and each boiler heats 4877 feet of piping. Originally the architect arranged a series of underground flues, communicating with a smoke-tower, which was 96 feet high, at a distance of 500 feet, but these arrangements have now been superseded by the flues from the furnaces being carried up within the wings of the building. The water supply is derived from tanks in Richmond Park, filled by engines near the Temperate-house in the Kew Gardens pleasure-grounds.

GREEN GLASS.

The glazing of Kew Palm-house is in every way a success, as I am informed by Mr. J. Smith, the able Curator of the gardens, to whom I am indebted for many hints. Plants growing in stove and other houses often, as is well known, suffer from the scorching influence of the solar rays, and great expense is frequently incurred in fixing blinds to cut off this destructive calorific influence. From the great size of a large building such as the Palm-house at Kew, it would be almost impracticable to adopt any system of shades or blinds which would be effective, and it was therefore thought possible that, by the use of tinted glass, which should not itself be objectionable in appearance, the most scorching of the heat rays might be arrested. Mr. R. Hunt made the suggestion, associated with Sir William Hooker and Dr. Lindley. The glass eventually used, after a long series of experiments, is that which we now see employed in the Palm-stove, and several other buildings at Kew. I have brought some specimens to show you. The glass, as you will observe, is of a light green colour, which is obtained by oxide of copper, and the glass is made so transparent that scarcely any light is intercepted. This glass is manufactured entirely free from the oxide of manganese, which is commonly used in making all ordinary sheet glass. The absence of manganese must be insisted on, and for this reason: that glass, into the composition of

which manganese enters, will lose its green shade, and be certain to assume a pink tint after long exposure to much sunlight, and any tint of a pink colour would completely destroy the peculiar properties for which this glass is chosen. Messrs. Chance, of Birmingham, are the manufacturers, and I cannot do better than recommend it for more general use for

Fern-houses, Palm stoves, and other similar buildings. It will be seen, however, by a visit to Kew Gardens, that where the glass has not been carefully manufactured, or by other makers, that the green has entirely left the glass, the pink tint which I have described having taken its place. The cost, at present, of this tinted glass is, I believe, about twice as much as

ordinary 21 oz. British sheet. The appearance of the green glass is very effective, especially when seen from the interior of large buildings. In ordinary conservatories I am inclined to think it might be adopted with much advantage, although some horticulturists object to its use, and especially I would introduce it in the lower panes of vertical lights, say

on the south side, or anywhere where the glass is near the roots and pots. Much damage is often done by the burning up of roots by radiation from the side-lights, and, therefore, it may be remarked vertical lights generally should be lessened as much as possible. Stippling is now resorted to to avoid this scorching, but the method is a troublesome and by no

means good-looking procedure. The whitewash with which the glass is clouded soon becomes begrimed with dirt and soot. Clouded glass, I believe, is sold, but, like the Kew green glass, it cannot be used entirely in general conservatories with advantage, because in early spring most people want flowering plants, for which as much light as possible is required. I think, however, that a combined use of both plain and Kew glass might, even in ordinary circumstances, be made with increased success, and more extensively than at present, and so avoid stippling.

With regard to the glass-houses of the French, we have little or nothing to learn beyond the fine propagating-house at La Muette. The appearance of most French conservatories is spoiled by the method employed for shading, which is bad, expensive, and awkward. Laths painted dark green and connected together by means of a string and hooks, are adjusted as blinds on the top of the houses, reached by gangways running along the top of the roofs.

GLAZING.

The French, however, have one mode of glazing which seems worthy of adoption, as it presents a neater and rather more satisfactory effect than laps as we use them. The sheets of glass, instead of being allowed to lap, are made with a butt joint, a small quantity of putty being rubbed into the joints when the glass does not exactly meet evenly. Strips of lead-paper, about half an inch wide, are then fastened on to the outside over each joint by the use of a solution of indiarubber or marine glue. A good effect is produced by this silvery strip of lead-paper, and repairs are easily effected, while the glazing is almost hermetical. It has, however, one objection for stoves and other houses where the temperature is a high one, and much moisture is given off, on account of the condensed water having no means of escape, excepting by drips, and at the bottom. By curving the upper and lower edges of each sheet of glass in the top glazing (see fig. 10) the water is brought from the sides of the pane into the centre, and, if properly fixed, much of the condensation water inside will find its way from the under-side of one sheet on to the outside of the next sheet of glass below it; and this is the method I have adopted in my own conservatory with success. In houses where a high temperature is kept up, such as in stoves, forcing-houses, &c., a good method to carry off the condensation water, which in these cases during cold weather is considerable, is to cut the roofing-glass in panes, like this (fig. 7), and provide grooves in the sash-bars, thus (figs. 8, 9), the object being to drain the water to the edge of the pane, when it runs off into the groove of the sash-bars to be caught in a gutter below. Several patent systems of glazing have been largely used with much advantage, chiefly Helliwell's and Kendle's; but for houses where architectural considerations are of any importance, the want of constructional lines on the exterior can but be an objection to the use of these methods; that is to say, if the two systems are used as shown by their patentees. There can, however, be no doubt that both modes are practically admirable, more particularly for large iron roofs, such as the Victoria Station shed, or at the Westminster Aquarium, where they have been successfully employed. When ordinary or curved laps, such as I have described, are used, the lap should be as small as possible, say 3-16ths of an inch, just sufficient to keep out the wet, and not allow dirt or water to collect, lest the latter should freeze, and result in cracked or broken glass.

CURVILINEAR HOUSES.

Curvilinear houses have many advantages, and may either be constructed with iron or bent wood, and glazed with either straight or curved glass. For ordinary purposes wood is preferable to my mind, and if used with care a very good effect may be produced by the use of straight glass. Some of the designs exhibited on the walls illustrate the style of thing both in domes and curved roofs which one would recommend. For opening ventilating lights there are several methods. One of the best that I have seen is that used by Messrs. Messenger, the well-known horticultural builders of Loughborough. Their mode of opening the lights, which are all hung on hinge butts, is based on the principle of the old quadrant, and nothing is more simple and effective after all. A sunflower enrichment decorates the enclosing shields of the lever with good effect. Mr.

\* An illustration of the new boilers was given in the *Gardeners' Chronicle*, November 17, 1877.

Elsley, of Great Portland Street, has an admirable lever for opening vertical lights, and I speak from experience when I say they are light in construction and work well.

It is to be feared with all these constructional particulars that I have wearied you and laid myself open to the charge of having said but little about the more direct bearing of art upon conservatory building. My aim, however, has been to furnish a few of the leading practical details, and it is only upon such data that a true artistic treatment of any structure can be effected. Pugin once said, with reference to the

THE QUEEN ANNE STYLE.

The "Free Classic," or if you like to call it so, the "Queen Anne" style, cannot claim to be a pure style, neither is it of a high monumental order; but, as I said in starting, it lends itself better than any other style yet chosen for interior domestic finishings. The internal treatment of conservatories, like our houses, will tax the skill of the designer far more than the exteriors. Much may be done with curved ribs in the roof, either of wood or iron; but in glass-houses, treated chiefly as ornamental buildings, in which decorative plants are grown, the foliage of creepers

up the green foliage, and it also retains the heat better than a light-surfaced wall. This is an important point when the temperature of the conservatory during the cooler hours of the night is taken into consideration. For the finishing of the woodwork I think nothing looks better than a light pea-green made with white, light Brunswick-green, and a little celestial-blue. In conclusion, I have only to remark that, with this class of building, like most others, a little thought and taste will often enable much to be made out of but very little material. Take, for instance, a lean-to adjoining a dining or drawing-room; it may be small, but small as it is, it will frequently give double value and interest to the room; or a floral porch to the chief or garden entrance will add greatly to the importance and comfort of the house; while in towns and limited areas a first-rate conservatory can often be managed on the top, either of the entrance portico, or over the slip-room flat in the rear. Several of these suggestions I have practically shown in the collection of drawings on the walls, to which I will refer you, if you have not already had more than enough of my text, "Art in the Conservatory and Greenhouse;" and I hope that my paper will tend to bring horticulturists as well as architects to consider glasshouses, of whatever kind, as worthy of more thought from an artistic point of view than that hitherto devoted to the subject. *Maurice B. Adams, A.R.I.B.A.*

GENERAL PLAN OF THE PALM-HOUSE AT KEW. (SEE P. 140.)

Crystal Palace, "Let Sir Joseph Paxton build his conservatories, and I will build my churches." Since then, however, if work has not decreased the profession has certainly multiplied, and few architects now could afford to decline work because it is not monumental in its character. Had Pugin lived now, I feel sure he would have been among the first to recommend his professional friends not to neglect so increasingly important a class of building as conservatories and glass-houses. There is this fact also certain, that he would have urged his true principles into the subject, and one has only to look at the

will soon hide any elaborate architectural detail, so that what are primarily wanted are good leading lines, such as elliptical or half oval curves, upon which creeping plants may be trained, thus forming natural bowers which will be satisfactory and complete. The architecture must always have but one purpose, evident at once to all, viz., the setting-off of the plants and flowers; and these should be arranged in borders as much as possible where ornamental suitability is studied, and much may be done with hanging baskets and pots for trailing foliage. Leaded lights in tinted quarries may be used with good effect for the upper

Florists' Flowers.

**AURICULAS.**—If the weather should be mild about the first week in February, the plants may be top-dressed. In doing this remove a considerable portion of the old soil which has become exhausted, and replace it with a compost consisting of two parts good loam to one of rotted manure, to which a little sand and a fourth part of leaf-mould may be added. I generally use cow-manure, but some very successful growers prefer to use stable manure. The compost must be pressed down rather firmly, and the pots must not be filled so full that water cannot be applied in sufficient quantity. At present the plants are quite hard frozen; a frosty wind with 16° of frost, which we experienced, had quite as much effect on the plants as 26° on a calm still night. We had a good opportunity when the thaw came, to look over all the plants and thoroughly clean them, removing nearly half the leaves which had decayed, leaving the centres quite sound. Some species of *Primula* in the same frames as the Auriculas have not wintered quite so well; of these may be named *P. sikkimensis*, *P. purpurea*, *P. cashmiriana*, and *P. capitata*. The newly introduced *P. rosca* lost all the old leaves, but the crowns are sound. *P. Parryi*, a rare species, also lost all the old leaves, but it has a sound centre to start from.

CARNATIONS AND PICOTEEES.

Where the plants were established before the first frost set in, they have stood over the winter so far very well. In cases where scarcely any roots were formed the plants had suffered, and were considerably shrunk. The old stools containing many layers that had not formed roots, were placed into a house where there was no artificial heat, and for most of the time since they were placed there the soil in the pots has been frozen, so that roots could not be formed. They will be again looked over early in February, and all the rooted layers will be removed. The layers that were potted off, and are now in cold frames, should have been looked over to remove the withered leaves, but we had not time to do so; now we must wait until there is a general thaw. Should the weather become mild, the frames containing these and Auriculas must be freely aired, and the plants must be potted into their flowering-pots about the end of February.

CHRYSANTHEMUMS.

Still continue to take off cuttings, if the required number were not put in early in January. Some varieties are shy in producing suckers, and it is necessary to wait until March sometimes before they are ready. Slugs have been very troublesome this year, and have eaten over a considerable number, but we must blame ourselves for not being more diligent at night in searching for them with a good lamp. It has been advised to place the pots containing the cuttings over a gentle hotbed. So soon as they are rooted the young plants must be removed to a frame or cool greenhouse, where air can be admitted more freely than it can be to a frame where cuttings have not

CROSS SECTION OF THE PALM-HOUSE AT KEW. (SEE P. 140.)

small lean-to conservatory at the Grange, at Ramsgate, the residence Pugin built for himself, to see how thoroughly he knew how to bring his art to bear upon anything which he designed.\* It is more than thirty years ago since that building was designed, a fact which at once causes the modern critic to look over many points which would be, perhaps, differently treated now. Pugin's was, of course, a florid Gothic style of building; now men's tastes have changed, and a more congenial domestic style has taken the place of the 14th century acutely-pointed arch and angular forms for our dwellings.

vertical lights and in gables, and an almost endless variety of effect may be obtained by introducing birds and fish, as well as fountains, for internal fittings. The colouring of the woodwork of the interiors of glass buildings is a point in which much taste may be displayed. For my own part, I prefer a light colour rather than a dark one for the roof and woodwork generally, always finishing the exterior simply with plain white. It is preferable, to my mind, to leave the red brickwork, both inside and out, neatly pointed with a struck joint of white mortar, and not washed with colour of any kind. Shelves and hanging boxes can also be more easily fixed than when the walls are plastered; besides which, the red brick helps to throw

\* See *Building News*, November 7, 1879.

formed roots. Some cuttings are so stubborn that it may be necessary to renew the heat for them.

#### DAHLIAS.

Merely see that damp does not go down the old stems to the crown of the tubers, and thus destroy the incipient buds. Any of the roots that are showing decay should have the part taken off, and the tubers may be started in a gentle heat. At the same time any scarce varieties, of which a good stock is wanted, should also be placed in heat. I find they do well either in boxes or pots. If these are placed over the hot-water pipes in an early vinery or Peach-house, they should be raised from the pipes sufficiently to prevent the roots from becoming over-heated.

#### GLADIOLUS.

There is no difficulty in keeping the bulbs (corms) over the winter if they are placed in a room from which frost is just excluded. I keep ours in a room that has no fireplace, in which but a small charcoal stove, when the frost is intense, is sufficient to keep the temperature above the freezing point. I have seen them destroyed by too much heat—in that case the bulbs were placed in pots over a boiler; there was a considerable thickness of bricks, and they did not get very hot, but it was enough to quite shrivel up and destroy a whole collection. I like to keep them dark and as cool as possible, and would rather have a degree or two of frost than too much heat. If any bulbs have been potted and placed in a greenhouse, they must be seen to with water when it is required. If any more start into growth, let them be potted and treated as previously advised.

#### HOLLYHOCKS.

Instructions were given last month for taking off the growths and potting or root-grafting them; these may still be followed out. Should a spell of mild weather set in, the young plants propagated by cuttings in the autumn, and now in small pots, will start into growth; if so, it will be necessary to repot them into pots one or two sizes larger; nothing is more injurious to such plants than allowing them to become root-bound. I like to leave one good growth on the old stool; and it may also be necessary to repot such plants as those a little later in the season. See that all are kept clean, and that red-spider is destroyed by washing the leaves with soapy water.

#### PANSIES, PINKS, &c.

Those planted out in beds will be all right if the surface of the soil amongst them had been stirred and the plants gently pressed into the ground during the thaw. They do not suffer from such dry clear frosts as we have now. A slight mulching of rotten manure is very beneficial. Pansies in pots will require some attention during mild weather; they will make some growth, and plenty of ventilation must be secured for them. Remove the lights in fine weather, as the plants become drawn and insects crowd upon them when they are not freely exposed to the air. If the small pots are well filled with roots, let the plants be potted into their flowering pots, if this has not been already done.

#### PHLOXES IN POTS.

Our plants were potted into their flowering pots in the autumn, but those who are growing them in pots and did not repot them should do it at once. If the pots can be placed in a warm greenhouse or any other house from which frost is excluded, the young shoots will start into growth, and cuttings may be obtained by the end of February. These if placed singly in small pots and forced to root quickly in a gentle hot-bed will make excellent flowering plants for next autumn.

#### POLYANTHUS.

Beds of the old favourite laced varieties out-of-doors have stood through the winter as well as those cultivated in pots under glass. As soon as the frost goes, and the ground is in good condition, we shall surface-dress with a compost similar to that recommended for Auriculas in pots, with less sand and leaf-mould. The Polyanthus likes a stiffer loam than that used for Auriculas. Plants in pots are treated very much in the same way as Auriculas, and as they start into growth earlier should be surface-dressed first.

#### PLANTS IN COLD FRAMES.

There are many interesting plants besides the above now cultivated in frames to be removed to the greenhouse or other structure when they are in flower. Many of the choicer species of *Aquilegia* are now in

pots, because of their tendency to degenerate or die out in our borders. The different species of *Primula amena* now show good healthy crowns, and require water as often as the Auriculas. *Anthericum Liliastrum* (St. Bruno's Lily) is starting very freely in 6 and 7-inch pots, three crowns in each. *Trillium grandiflorum* also shows healthy development, and is a charming plant for flowering in April with a little forcing. *Ixias* and *Sparaxis* have now made growths 3 or 4 inches in length in the cold frame. Then there is the beautiful *Meconopsis nepalensis*, interesting at present from its beautiful foliage, greyish-brown, studded with golden hairs. All the above have been hard frozen again and again. The *Ixias* grow away quite freely whenever mild weather sets in. All such plants are interesting to amateurs who cannot afford the luxury of heated houses, and they are valuable to all who have to supply greenhouses with plants and have but a small reserve of heated pits from which to draw them. *J. Douglas, Loxford Hall.*

## Garden Operations.

### KITCHEN GARDEN.

**POTATOS.**—The extent of the area which, as a rule, is set apart at most places for the cultivation of vegetables is not at all in proportion to that which would be required to grow Potatoes sufficient to form a supply much longer than the time they are required in a young and unnatural state. Under these circumstances more particular attention should be given to the cultivation within this area of such kinds as occupy least time to bring them to a fit state for use; and these, in my opinion, comprise those sorts which primarily originated in the old Ashleaf Kidney variety, and which have, by a course of careful selection, been wonderfully improved, and now are known under the denomination of Veitch's, Rivers', Myatt's, and other names. These sorts are far superior to all others for the purpose of obtaining early crops of tubers either within or out-of-doors; such excellent sorts are, moreover, specially adapted for cultivation within the limits of such areas because they naturally require soil which is in the highest state of fertility to produce them abundantly and in the best condition. We do not enter largely into the cultivation of round varieties for very early use because the state of the soil is too rich for them in such places, and generally they make so much haulm without a corresponding proportion of tubers to compensate for it and the space they require. Union, Coldstream, and Climax are, however, sorts which will be most suitable for early purposes if it be necessary to plant such within the area described.

Practical experience has clearly demonstrated that Potatoes when they have attained a fair size may safely be lifted, and for all culinary purposes the tubers keep quite as well as those which remain in the ground until they are ripe. This fact is worthy of note, as when this operation is done before disease is anywhere apparent, the crop of tubers is invariably saved from the devastation which so frequently now-a-days subsequently ensues if they are allowed to remain. This process will also prove to be advantageous to those having but a limited extent of ground and large demands to satisfy, by liberating it at an earlier date for those important subjects which usually form the subsequent crop, as the different kinds of winter greens, &c. I do not advocate the practice of planting general crops of Potatoes very early, particularly in low situations or in cold soils, because of the danger arising from the effects of spring frosts; but in the case of those which are intended for use as early as possible, the planting should be effected as soon as conditions will admit in February.

Early English grown Potatoes are greatly esteemed by those possessing gardens in general, and therefore a little extra care bestowed to secure them is often amply repaid. By the aid of turf pits, or others made with wood, to which coverings can be applied, these may be had fit for use a fortnight before those in the open ground, and this is certainly an advantage. The border at the base of a south wall is another suitable spot, which can be utilised for the same purpose, and give a successional supply until those which are planted on open but sheltered south or eastern borders come in. I make a practice of covering the rows of these, just as they begin to emerge from the soil, lightly with long stable litter. This material with a little attention answers the end in view, and comes in for mulching them afterwards, which on dry, inclined southerly borders, is in general beneficial. With a continuation of frost, many operations which might have been proceeded with will necessarily have to be postponed. With the prospect, therefore, of by-and-by being inundated with multi-

farious matters on all hands, it will be advisable to be prepared for such an emergency by assiduously persevering now in the execution of all such work as will lessen the burden whenever it comes.

### FORCING DEPARTMENT.

The prolonged period during which frost prevails this season is anything but favourable for keeping up supplies of such subjects as those which have to be procured from the open ground, and if supplies of some things, such as Asparagus, Seakale, Rhubarb, &c., run somewhat short at times it will not be altogether surprising, as ordinary precautions which are made for this purpose will hardly suffice to meet the case this season. From the same cause considerable difficulties will arise in regard to protection, as ordinary means will scarcely suffice to resist such oft-repeated severe frosts. The linings which surround frames which are heated by such means, will need to be kept well made up about the tops; those in which Potatoes are planted and up will want much care, these should be uncovered as long as circumstances will admit every day, but closing up betimes for the sake of the help in warmth which is attained. Other subjects, as Radishes, Carrots, and Asparagus, should also have light every day, but in the case of Cauliflower plants, Lettuce, Parsley, &c., the coverings may be left on under such conditions for a few days together. Continue to make sowings of French Beans and Mustard and Cress as required; at about the commencement of next month sow Tomato and Celery seed for an early crop. Long-pod Beans should also be sown in boxes if they are wanted for any special purpose: this method is advised for exhibition requirements. *G. T. Miles, Wycombe Abbey.*

### FRUIT HOUSES.

**THE CHERRY-HOUSE.**—Under the severe pressure from without, in the way of frost, intense in its character, too, it is not advisable to hasten on the growth "which is already animated in these trees" too rapidly, as any delay which may follow from this cause can be compensated for when circumstances are more favourable for the purpose. Let, therefore, the previous directions as recorded for this compartment continue in force. In order to destroy any green or black fly which may have escaped at the time the annual cleaning of the house was made, it will be wise to syringe the trees two or three times over, at intervals of a day or two apart, with quassia water. This should be done at the time the moisture lasts longest on the trees, and before the flowers are fully expanded. As this will shortly be the case with the trees in early started houses, opportunities which are favourable for the purpose of setting the fruit should not be neglected: the fructifying power of the pollen is most efficacious when it is light and dry; at such times, therefore, advantage should be taken of the opportunity to perform the operation. Many different opinions concerning the best way to effect this prevail: we have for many years past simply used a camel's-hair pencil for the process, with every degree of satisfaction, and therefore recommend that this method should be adopted. Bees are most helpful in this matter, but I prefer their spontaneous visits to having them confined within the house. *Geo. T. Miles, Wycombe Abbey.*

### FIGS.

During the continuance of bright moonlight nights, with the ground as hard as adamant, and the external temperature ranging below 20°, it is useless to think of increasing our night heats for the present. Fortunately the atmosphere is dry and calm, and we sometimes derive a little benefit from fitful gleams of sunshine, of which it will be necessary to take advantage by closing about 1 o'clock with a rising temperature, and if blinds of any kind can be used for running over the roof of the early house at nightfall the check to radiation will reduce the necessity for hard firing without running the risk of causing a check that might prove fatal to the crop of fruit. As a supplementary step in the same direction, the fermenting material that has been placed about the pots may receive frequent additions of warm Oak leaves on the surface, to be worked in when turning is considered necessary to the maintenance of a bottom-heat of 75° to 80°. It is quite true that a check to the loss of heat and moisture on the one hand and a well-managed bottom-heat on the other, will not give the healthy dark-green colour so much coveted to the foliage, but the two combined will prevent the trees from going back until this severe weather gives way to conditions favourable to the admission of more fresh air, and an increase in the amount of light. It will be necessary to examine the pots frequently, particularly where they are partially exposed to the parching influence of fire-heat, and at the same time to be constantly prepared with a good supply of tepid liquid, quite up to the temperature of the house, for use before the trees become dry. If properly drained and placed upon dry brick pedestals there is little danger of giving a pot Fig that is well furnished with foliage and fruit too much water, but the

want of it, if only for a few hours, may do irreparable mischief. Trees in succession-houses, having their roots established in good borders, are less likely to suffer from the above cause; but in order to keep them fruitful the range of their roots should be limited, the mulching good, and the supplies of water liberal. Where the planting of fresh trees is contemplated, the present time is favourable for making the necessary preparations, and the trees should be got into position with as little delay as possible. If the house has not been used for Figs, a limited space only will be required for the roots, and even then the borders may be made piecemeal. A good outlet for water, a concreted bottom, and an abundance of clean drainage form the first essentials. The compost, if made up of rather strong dry loam, old brick and mortar rubble, burnt refuse, or road scrapings, will sustain the trees for many years. This should rest to the depth of 2 feet on thin inverted turves placed over the drainage for preventing the finer particles from washing downwards. When raised to within 6 inches of the intended level, the trees, if in pots, will require shaking out, in order that the roots may be spread over the face of the new bed that has been made fairly firm and even. This done add 2 or 3 inches of soil, and give a little water to settle it about them, put on the remainder of the soil and defer mulching for the present. The choice of kinds may be left to the taste of the grower. For quantity, quality, and usefulness preference is generally given to Brown Turkey, and I am of opinion that we have nothing that can surpass it. *W. Colman, Eastnor.*

#### ORCHARD-HOUSE.

It is not necessary to go into the relative merits of the heated and unheated orchard-houses, although many good growers have stated that a heating apparatus is not an essential adjunct to successful culture. It is quite certain that a row of hot-water pipes round a small house, or two rows round one over 20 feet wide, may sometimes save a crop of fruit, indeed I have had practical demonstration of this. At present we just warm the pipes sufficiently to keep the temperature above the freezing point; the house is well ventilated whenever opportunity offers. See that none of the trees suffer from want of water at the roots, and when they do require water give sufficient to thoroughly wet all the soil in the pots. If the houses are not heated, it is desirable to keep the trees from making any attempt at growth at present, as the later they are in blossoming so much more will be the chances of the blossoms escaping late frosts. If the trees have been started with a little artificial heat the buds will now be swelling and showing their beautiful peach or pink colour. It is always better to err on the side of keeping the temperature too low at night than to have it too high thus early in the year. The slower the buds open so much the better will it be for the safety of the crop. The forcing of fruit trees of any kind in pots must not be trusted in the hands of careless or inexperienced workmen, as inattention to any details of the work may cause the loss of a crop for a whole season. I have noticed a tendency in some persons to water a tree when it did not require it, to save trouble at another time; others again apply it in dribbles. This will not do, especially at the time of blossoming; sufficient water must be applied to wet the whole ball of roots, and it must not be applied until the trees require it. Again, in heating the house, if this should be overdone, admit more air to counteract the effects of it. Indeed when the trees are in blossom artificial heat, and as much ventilation as may be possible, is quite right by day; a warm dry air kept in motion being essential to producing a good set. *J. Douglas, Loxford Hall.*

#### ORANGE-HOUSE.

It is almost necessary to keep up a high temperature in this house all the year round, as there are always trees in different stages—even now one of our trees contains fruit quite green, and which will not be ripe until the end of March; it will not answer to keep a low temperature while that tree is ripening its fruits. On the other hand the Tangerine Oranges usually ripen between September and the end of the year. The trees that ripened their fruit early would be placed in a cool vinery or other house from which frost is just excluded. It would be a mistake to put these into a house with a temperature of 60° to 65° at night at once. They may be placed at first into any vinery or Peach-house that is just being started, and it would be all the better could the pots be placed over a bed of leaves or any other fermenting material. The temperature will be gradually increased to suit the requirements of the Vines, and by the time the roof is partially overshadowed by the Vine leaves the Orange trees may be removed to a house with a temperature of 60° or more as a minimum. If the trees are pushed on in a high temperature through the summer, as they ought to be, the fruit will ripen in September. I cannot too earnestly urge the importance of keeping the leaves and branches of the trees quite free from insect pests. *J. Douglas, Loxford Hall.*

#### PLANT HOUSES.

ORCHIDS. — That very distinct and handsome *Oncidium*, *O. Lanceanum*, will now be starting into growth, and will require watering a little more frequently than it has done for the last eight or ten weeks. This plant must be termed a difficult one to do thoroughly well; for, although numbers of it have been under cultivation for many years, large healthy specimens are very rare. The difficulty is to keep its foliage free from "spot," which not only greatly disfigures, but too often kills; or perhaps it is more correct to say that plants which show this "spot" seldom recover good health. No doubt this "spot" is the effect of growing the plant under unsuitable conditions rather than any leaf-attacking disease. Whatever causes the foliage of this *Oncidium* to "spot" must be of a very subtle nature, for I have known two plants grown side by side under, to all appearance, exactly the same conditions, and the one has been healthy and the other diseased. We have here a large healthy plant growing in a well-drained pan, with crocks, charcoal, and a little sphagnum and fibry peat to root in. The tips of its leaves almost touch the roof-glass on the west side of the East Indian-house. For several weeks it has had but little water, but will now be more generously treated. The foliage is often sponged over with clear water, which, if it does no good, certainly does no harm. The rare *O. hematochilum* is in its native habitat found growing with the above species, and in cultivation will take the same treatment. The present is a good time to top-dress or repot either.

*Oncidium ampliatum* and its major variety will also be just starting their flower-spikes, and will take a good heat to bring them along. From now water must be given often enough to keep the roots moist. Woodlice and other pests are very fond of the spikes of this plant, and too often devour them before they are high enough to attract the grower's attention. To avoid this let traps be set, and the spikes, when long enough, be protected by a ring of wool. Any plants of *O. Cavendishii* that have spikes of bloom now opening should be placed in the East Indian-house to expand, as their growing quarters in the intermediate-house will, during this severe weather, be rather too low in temperature for that purpose. Flowering plants of *Cattleya Trianae* would also develop their buds better if treated the same. *C. gigas* and *C. Dowiana* will both now be starting into growth, and must no longer be kept so dry at the root. The former should be grown with its foliage almost touching the roof of the Cattleya-house, and the more light it can get, barring actual sunshine, the better chance there will be of flowering it. This also holds good with *C. Dowiana*, but it requires a few degrees more heat. We have just given our plants of this species more root-room by dropping their baskets into larger ones and filling the space between with crocks and peat. By this plan no roots are injured nor does the plant get in the least checked. *Cœlogyne barbata*, *C. Gardneriana* and *C. Massangeana* may now be safely potted should they require more root-room. All the species just mentioned will grow well in peat and sphagnum; and as they neither of them make a large quantity of roots, small shifts must in their case be the rule. An intermediate temperature will suit them admirably.

The hot-growing *Cœlogyne pandurata* and *C. Lowii* may be repotted as they pass out of flower. Both are strong growing plants, very interesting when in flower, but their size is against them where room is not abundant. A thorough soaking with weak liquid manure should be given to *Cœlogyne cristata* just as it commences to open its flowers, which will assist the plant through its greatest trial. This very useful Orchid will succeed in any house where an intermediate temperature is maintained. It delights in a clear light, and will enjoy at times direct sunshine; when grown too shady the spikes rarely carry more than four or five flowers each, instead of six or seven. *C. Lemoniana*, a variety of the above, will throw even more flowers to a spike. It is a very desirable plant, which comes into bloom a few weeks later than *C. cristata*, and thus prolongs the *Cœlogyne* season. It is distinguished from the typical *C. cristata* by its lemon-coloured centre. In watering these two plants give a thorough soaking, but not too often. A large specimen in the collection here, growing in well drained peat and sphagnum, never takes water oftener than once a fortnight, although it is growing in a very exposed position.

So long as this severe weather lasts each department must get a thorough damping down every morning, and the floors will require to be sprinkled over every evening. The night temperatures must not be raised above those given in a late Calendar. The day temperatures must also be kept the same so far as fire-heat is concerned; if the sun is good enough to raise them so much the better—at such times give a little air to every department through those ventilators nearest the hot-water pipes. On all cold bright mornings raise the temperatures by small sharp fires, so that by the time the sun makes itself felt in the houses the fires will be so small as to throw a minimum of

heat. It is an unfortunate circumstance when the sun pops out with force and finds the stoker with his furnaces full of fire; nothing less than drawing such fires will speedily put matters right. *J. C. Spers, Burford Lodge, Dorking.*

#### TOWN GARDENING.

Since I last wrote the frost has returned with as great severity as ever; the ground is as hard as flint, and such work as digging, levelling ground, and gravelling walks, is out of the question. Outdoor work is pretty nearly at a standstill, with the exception of pruning shrubs, lopping trees, and turning heaps of leaves and manure, &c. I find that the Myrtles, *Euonymus*, *Aucubas*, *Bays*, *Phillyreas*, common and Portugal Laurels, have suffered very much from the frost this season, and the bushy *Veronicas* are quite killed. Some of the trees best adapted for planting in town are the Plane, Lime, Horse Chestnuts, Elm, Poplar, and Ailantus. The Plane perhaps stands first for town planting, and that may be accounted for, to a certain extent, through the bark being smooth, and so able to resist the soot. It also partially sheds its bark, and thus partly cleans itself. The Plane does not require much pruning after it gets 20 or 30 feet high, but when pruned at all the branches ought to be cut off close to the trunk, for if not done so it forms a multitude of miniature shoots round the cut, and, practically speaking, makes the tree thicker than ever. The Lime is a fine tree for town, coming into leaf some time before the Plane; it will stand any amount of pruning, and will grow in almost any soil. The Horse Chestnut, although not of such rapid growth as the two preceding, is nevertheless well adapted for town planting; its bark is of a close nature, and a shield against the soot. The Elm has rougher bark, and therefore retains the soot; and if the trees are allowed to stand too thick, the branches not thinned out, so that the air and light cannot get to dry up the wet from the bark, it causes a red fungus to grow, which if not eradicated will soon make sad havoc with the trees. The Poplar also stands well in towns, as, being of free growth, it is able to cope with the atmosphere. The Ailantus, although not often met with as a large tree, stands well in towns, and ought to be more extensively planted.

Where old subtropical plants have been stored away in the autumn to furnish cuttings in the spring, which is the best plan if practicable, cuttings should be put in of *Abutilon brasiliense*, *A. Boule de Neige*, *A. Thompsoni*, *A. vexillarium marmoratum*, *A. niveum aureum maculatum*, &c.; *Bragmansia Knightii*, *Cineraria platanifolia*, *C. acerifolia*, *Sonchus pinnatus*, *S. laciniatus*, *Udlea bipinnatifida*, *Wigandia caracasana*, *Polymnia grandis*, *Ferdinanda eminens*, *Aralia papyrifera*, &c.—the latter propagates best by the roots. *Musa Ensete* and *Canna* seed in variety should be sown at once and plunged in a bottom-heat of from 80° to 90°. *Musa* seed should be sown one seed in a 60-size pot. *Canna* roots may be brought into a heat of 55° to 60° to start. *Acacia lophantha*, *Eucalyptus globulus*, *Centaurea candidissima*, *C. Clementei*, *Cineraria maritima*, *Artemisia judaica*, *Chamaepeuce diacantha*, *C. Cassabone*, *Grevillea robusta*, should also be sown in heat without delay, although I find the best month to raise them from seed is August, and grow them on. *Alternantheras* should now have a heat of from 60° to 70°. *W. Gibson, Royal Hospital Gardens, Chelsea, S.W.*

FREE AND COMBINED PHOSPHORIC ACID.—One of the most important subjects discussed by the German scientists who lately met at Baden-Baden was the agricultural value of the reabsorbed phosphoric acid in phosphorites. The German phosphorites (including Brunswick coprolites) always contain, in addition to the phosphate of lime, small quantities of clay and oxide of iron. Treated with sulphuric acid, in order to render the phosphoric acid soluble in water, these phosphates, of German origin, exhibit the disagreeable property of taking up again the phosphoric acid. After being stored for a time, a portion of the freed sulphuric acid recombines with the clay and oxide of iron, and is no longer soluble in water. But Professor Petermann, of Gembloux, Belgium, Professor Grandeaue, of Nancy, and others, have discovered that even the phosphoric acid in the soil soluble in water combines again with lime, clay, and iron, and so becomes insoluble. They also show that combined phosphoric acid is better for loose, open, sandy, or peaty soils than soluble. It appears to be the wish of the owners of coprolite deposits, &c., that the chemists should admit the recombined phosphoric acid in their valuations of the phosphorites, and the meeting was asked to support the request. After a long discussion, it was decided not to oppose the object sought, but it was not considered that the experiments hitherto conducted were sufficient to determine the relative values of recombined and precipitated phosphoric acid. It was also resolved that further experiments should be undertaken to elucidate the matter.

APPOINTMENT FOR THE ENSUING WEEK.

THURSDAY, Feb. 5.—Meeting of the Linnæan Society, at 8 P.M.

TOWARDS the close of last year, when FLOWERS FOR THE DINNER-TABLE were necessarily scarce articles, a discussion arose in the columns of the *City Press* as to the propriety of occasionally substituting artificial for real flowers for such purposes. The discussion welled over into the *Gardeners' Magazine*, and while very amusing *per se* involved a principle, the discussion of which may be of some value. The debate was opened by a correspondent of the *City Press*, one "T. H." We do not know who "T. H." may be, but from internal evidence we decide against the notion that it is THOMAS HUXLEY. At any rate "T. H." reminds us that towards the end of a long evening all that's bright must fade, "the delicate blooms of the hot-house begin to droop and sicken." Some people might think that this circumstance might be utilised as a floral clock, to remind the guests that it was time to go home.

From this latter point of view it would be well that hosts, especially those with mercenary views, should not be permitted to employ gummed or wired flowers, else the same effect would result as would be produced by setting back the clock. "T. H." however, may be one of those who "won't go home till morning," and in order that he may have no reminder of the foot of time (though that falls noiseless when it only treads on flowers, we are told), he proposes that the very best artificial flowers should be used—everlastings—which not the heat, nor the odour, nor the postprandial eloquence of a heavy dinner could cause to droop and sicken. To complete the illusion, "the addition of a few drops of rose-water renders the deception complete." "T. H." has but to take his seat at the first *table d'hôte* he comes to on the other side of the English Channel to see his ideas more or less completely realised. We wonder how "T. H." would like his ideas as carried out in such places. What would his feelings be when he saw the flowers removed after the feast to the mantelpiece on either side of the inevitable clock, backed up by the distorting surface of the mirror, to be again removed to the festive board at the next morning's *déjeuner*? Let us suppose him to pursue his way, seeing the same migrations day after day, till at length he returned to his starting point to find the same epergnes, the same dusty calico abortions, going through their daily performances with as great—probably more—regularity than the clock. How much rose-water would be required to render the deception complete in this case? But probably we are not quite fair to "T. H.," who did not intend his flowers to be twice cooked in this fashion. But this is what it would come to, we suspect.

"T. H.'s" views, however, were not long allowed to pass unchallenged. Mr. SHIRLEY HIBBERD took up his pen—it must have been in good order—ink fluent—paper all it should be. As might have been expected, Mr. HIBBERD was indignant—almost insulted—by the proposal; but, the first sense of injury past, humour and ridicule are poured out on "T. H.," who is told "that the viands and the drinks fade like the flowers in the course of the evening." To obviate this, "let there be provided at every banquet a table for the especial delight of people who believe in artificial flowers sprinkled with rose-water. On this table place

the best examples of floral industry in calico, paper, metals, feathers, and bombazine, and on the same table let all the dishes be of papier-mâché, clay, wax, plaster, bunkum, or whatever else may be needed in the production of artificial fried soles, roasted larks, stewed kidneys, and mincemeat pies. These can be sprinkled with aromatic gravy to make them fragrant as the realities of which they are the painted effigies. Let all persons of healthy taste and good judgment dine as usual with real food, real wine, and real flowers; but let the advocates of sham and shoddy have a bellyful of their favourite diet; and in the name of all that's blissful, I do wish they may get fat upon it."

Such an outburst of ridicule does not quite quench "T. H.," who, in reply, requests his antagonist to put his paintings behind the fire, to consign his statuettes to the dustman, and to deprive himself of artificial matters generally and to substitute the real thing. Were it possible or suitable to do so, no doubt Mr. HIBBERD would gladly do so. But when a thing is either not appropriate or not practicable, one is surely not to be blamed for employing the best available substitute—always provided that it is not better to do without altogether. For our own part we should be inclined to think a table decorated with a well cooked roast quite sufficiently decorated without artificial flowers scented with rose-water. We might even prefer a moderately spread board to one all tablecloth and Parsley, but these are matters of opinion. A few well arranged flowers, a graceful foliage plant, no doubt are improvements to any dinner-table, but as to artificial flowers, however good, we demur to having them near at hand, and would sooner have them at a distance.

The question, however, between realism and artificiality is a very wide one. We know of no test whereby to arrive at any definite conclusion but that of appropriateness. Is it appropriate to employ a vaseful of painted calico scented with rose-water? Certainly not, we should say, when any lover of Nature is at hand; but if the diners are so insensible to the charms of Nature as not to know when they have a calico bouquet duly scented before them, why then it would be well not to disturb their blissful ignorance, but trust to the Board Schools to instruct the rising generation in more wholesome tastes. On the other hand, is it appropriate to put pans of Water Cress all alive oh!—growing, that is—on the dinner-table? Is it good taste to put a pot Vine with its hanging clusters on the table? These things are very pretty doubtless, but when touched by the test of appropriateness it seems to us that to convert a dining-room table into the semblance of a kitchen garden or a vinery may, after all, not be in better taste than the employment of floral millinery scented with rose-water, or than with the atrocities cut out of Carrots and Turnips for the decoration, so called, of certain dishes.

Readers of CHARLES DICKENS' recently published letters will remember the monster bouquet measured in yards presented to him by some of his American admirers. Visitors to foreign flower shows will have seen such aggregations, intended to compliment some distinguished person or other, and to grace (?) his dinner-table. Are such monstrosities, with their hundreds of real Rose-buds and thousands of Violets, requiring no added perfume, less objectionable than jugfuls of canva flowers? We doubt it—but *chacun à son goût*.

We ought not to omit the conclusion of the discussion which has suggested these remarks. It agrees well with the general endings of such paper wars. "T. H." maintains his own opinion—that amongst these uses (that of artificial flowers) is included the decoration under special conditions of dress dinners," and—"he has nothing else to say."

— HON. MARSHALL WILDER.—We are glad to learn that this enthusiastic horticulturist has sufficiently recovered from his accident to be able to preside at the annual meeting of the New England Historical Society, and to deliver an address which will vie with others that have issued from the lips of this old man cloquent.

— MONSTROUS THISTLE.—A curious example of *Carduus crispus*, in which the flower-heads were abnormally numerous and aggregated in secondary heads, as in *Echinops*, was lately obtained by the Rev. J. A. PRESTON, in Wiltshire, and exhibited for him by Mr. BAKER, at the Linnæan Society's meeting, on the 15th inst.

— FARMERS AND THE INCOME-TAX.—Messrs. JOHN PARKIN & SON, estate agents, of Idridgehay, near Derby, write under date January 27:—"On the 22d ult. we put the following question to the Board of Inland Revenue in reference to the allowances of Income-tax authorised to be made by Treasury letter of the 13th ult. in cases where temporary abatements of rent have been granted by landowners to their tenants for the current fiscal year 1879 and 1880 on account of the agricultural depression, and have this morning received the answer set opposite thereto:—

<p>"Question. If allowances are made at the rate of, say, 10, 15, or 20 per cent., to be expended in draining, lime, bones, oil or other cakes, will a corresponding deduction in the tax be made?"</p>	<p>"Answer. Nothing but actual reduction in money payment can be recognised."</p>
---	---

— IMPROVED POTATOS.—"Experimentalist writes:—"I have to thank Mr. FENN, our highest living authority on this subject, for his response to my query. I gather from his remarks that the Potato plant, as in the case of the Apple, Pear, Camellia, &c., undergoes a gradual exaltation of properties after, so to speak, its mere physical adolescence, and that after this its individuality is fixed for ever. It was upon this special point that I judged information to be desirable. Selection of seedlings is a very different thing."

— M. HIPPOLYTE WALFERDIN, who has just died in Paris at the age of eighty-five, was the colleague of DULONG and ARAGO in investigating the central heat of the earth, and the inventor of vertical self-registering thermometers, as also of the *thermomètre à déversoir* for ascertaining the temperature of water at great depths.

— HEAVY RAIN.—A Press despatch from Normanton, Queensland, states that a tornado burst between that place and Byrnes on November 8, and 6 inches of water fell on the plain in half-an-hour.

— THE GENUS EUCALYPTUS.—The fourth decade of Baron VON MUELLER'S descriptive *Atlas of the Eucalypts of Australia* has lately been published. It contains lithographed representations of *E. alba*, *botryoides*, *clavigera*, *Doratoxylon*, *Gunnii*, *Planchoniana*, *rostrata*, *siderophloia*, *Stuartiana*, and *uncinata*. The Baron very properly objects to the term Gum-trees, which should be applied to the *Acacias*, which do yield gum, the *Eucalypts* furnishing kino. The value of this monograph, for practical as well as for scientific purposes, can hardly be over-estimated.

— EPPING FOREST.—At a meeting of the Court of Common Council held on the 22d inst., the appointment of Mr. ALEXANDER M'KENZIE as Superintendent of Epping Forest, at a salary of £500 a-year, was ratified.

— PTERIS SERRULATA CRISTATA MAJOR.—The fine examples of this now to be seen in the large stove at Chiswick warrant the assertion that it is a very handsome and useful winter Fern, of vigorous growth and handsome proportions. The plants attain great size and symmetrical proportions, the fronds arching over in a particularly graceful manner. A single frond will grow to the height of 4 feet, and the pinnae attain to a length of 15 inches. It is a variety that is supposed to have originated as a sport with Mr. H. HERBST, of Richmond.

— CROYDON HORTICULTURAL SOCIETY.—The summer show of this Society is announced to be held on June 30.

— THE FROST IN LANCASHIRE.—Mr. SAMUEL BARLOW states that last week the most severe frost he can remember in the Middleton district was felt; all the week it ranged from 14° Fahr. to 2° Fahr.—18° to 30° of frost. So severe is it that he has found it advisable to remove his choicest plants of Polyanthus from the cold frame to a house from which the frost is just excluded, as the plants were frozen through and through. The heavy fog which accompanies the frost appears to be pretty general all over the country, and makes the wintry weather hard to be borne.

— RUBUS EIFLORUS OR LEUCODERMIS.—This is just now a striking feature on the wall opposite the Council-chamber at the Chiswick Gardens. The mealy stems, which have taken on a silvery white-

opened being included. We hope Messrs. LETTS will receive such support that they will extend their programme, and give ultimately some "physical geography" maps, showing the extremes of temperature, and the monthly means, the average rainfall, and other such details, with especial reference to the periods at which vegetation begins, is in full activity, or ceases in various countries. Such information would be valuable to agriculturists, Tea-planters, Cinchona growers, as well as to gardeners at home.

— ST. PAUL'S WEATHER.—Professor HENRY ATTWELL, of Barnes, writing to the *Times* on the 26th inst., states that "St. Swithin's weather" is still a household word; but some among those who enjoyed last Sunday's sunshine may not know that in

the name leptoclada is often erroneously given, is, according to M. CARRIÈRE, a seedling derived from *R. sphaeroides*. It produces cones every year, and reproduces itself true from seed.

— THE SCOTTISH SEED AND NURSERY TRADE ASSOCIATION.—The annual meeting of this Association was held in the Waterloo Hotel, Edinburgh, on the 21st inst., Mr. DAVID SYME, Chairman, presiding. Mr. DAVID HUNTER, S.S.C., Secretary, read the annual report, which stated that the membership numbered forty-four, and that there was a balance due to the Association of £53 10s. 9d. In accordance with the remit made to them at the last general meeting, the committee and office-bearers had formed themselves into a court of arbitration to which members of the

FIG. 31.—GUNNERSBURY HOUSE, ACTON, THE RESIDENCE OF THE BARONESS DE ROTHSCHILD. (SEE P. 147.)

ness, are in harmony with the wintry surroundings, and the powdery secretion is in marked contrast with the sober bark of other wall plants close by. It produces at the end of the summer berries of fair size, and of a deep orange-yellow colour, sweet and pleasant to the palate.

— LETTS' POPULAR ATLAS.—A good atlas is a desideratum for most people, and young gardeners especially would find the advantage of consulting a trustworthy publication of the kind. A good atlas, however, is usually a very costly affair. We have one before us which promises to be inexpensive and very well worthy the monthly expenditure of 7d. The maps are clearly printed, indicate the direction of the polar and equatorial currents, the limits of ice, the main lines of telegraph, that to the Cape only just

Western Europe the state of the weather at the Feast of the Conversion of St. Paul was for centuries regarded as prognosticating the character—prosperous or otherwise—of the whole year. The forecast was couched in the following uncouth verses:—

“ Clara dies Pauli bona tempora denotat anni;  
Si nix vel pluvia, designat tempora cara;  
Si fiant nebulae, pereunt animalia quaeque;  
Si fiant venti, designat praedia genti.”

— RETINOSPORAS.—In a recent number of the *Revue Horticole* M. CARRIÈRE notes the fact that *R. dubia* and *R. Ellwangeriana* are forms of *Thuja*—*R. juniperoides* or *glauca* of a species of *Biota*. Most of the *Retinosporas* with linear leaves and cylindrical branches are but juvenile or "larval" forms; *R. leptoclada* is an exception. *R. andelyensis*, to which

trade throughout Scotland might refer any important disputes arising in the course of their business; and a circular was addressed to the trade stating that the services of the committee would be placed at the disposal of all such disputants on payment of one guinea to the funds of the Association, besides the expenses connected with each case. Several cases had arisen during the year, but none of them had been formally submitted to the committee, though members of it had been consulted in several instances. A prize had been offered for the best essay on "The best means of discovering the various forms of adulteration and admixture in Clover seeds." Only one essay had been received, from Mr. JAMES MACINTOSH, of the Lawson Seed and Nursery Company, and a prize of £3 3s. had been awarded to the writer. The committee recommended that the prize should be

re-offered. The report was unanimously adopted. The committee and office-bearers were then appointed, Mr. JOHN DOWNIE being elected Chairman, and Mr. R. T. MACINTOSH, Vice-Chairman. Among the subjects discussed was the system of giving credit to farmers, regarding which it was remitted to the committee, with power to frame such a resolution as would place seedsmen and farmers on a more satisfactory footing in this respect—that would, in fact, make seed accounts preferable claims, seeing that the produce of seeds was always for the advantage of the landlord or other creditors when the farmer went to the wall. This it was proposed to effect by getting factors to become security for the seed accounts contracted by the tenants. The regulation of the usages of the trade was also discussed, especially in regard to Rye-grass seed, and it was remitted to the committee to frame a resolution providing that delivery of Rye-grass seed should be held as a fair delivery if within half a pound of the weight per bushel specified when sold. The annual dinner of the Society took place in the evening, Mr. DOWNIE presiding, and Mr. R. T. MACINTOSH officiating as croupier.

— TOWN REFUSE.—The Streets Committee of the City of London Commission of Sewers reported at the last meeting of that body that during the last year the quantity of slop, dust, and refuse removed from the city had been 62,797 loads, being an increase of 9000 loads on the average of the last ten years.

— ALOES AND VUCCAS.—A synopsis of the Aloe and Yucca tribes is another of the series of communications on the Liliaceae, which Mr. J. G. BAKER favoured the Linnean Society with at their last meeting (January 15). They are a set of plants well known in gardens, but from their large size and often succulent character are represented very sparingly in herbaria, and have been almost totally passed over by travelling collectors of dried specimens. They fall sharply into the two tribes, which are marked by well-defined botanical characteristics, and they have completely different geographical dispersion. Of the Aloes, characterised by their gamophyllous perianth and thick fleshy leaves, there are nearly 200 species, all confined to the Old World, and some 170 of these are concentrated at the Cape of Good Hope, and the remainder are scattered through the highlands of Africa. The four genera, Aloe, Gasteria, Haworthia, and Aporia vary in habit from plants half a foot high (when in flower) with sessile rosettes of a few fleshy leaves, to copiously branched trees 50 or 60 feet in height. Nearly all the known Cape species are in cultivation in English gardens at the present time. The best known officinal species, Aloe socotrina, which has been attributed to the island of Socotra, has been found lately in a wild state at the Cape of Good Hope. The Vucoideæ are characterised by a polyphyllous perianth, the leaves of which are never thick and fleshy. In addition to the type genus, Hesperaloe, Dasylirion, Beaucarnea, and Herreria belong to this group. Of fifty species known, all American, the bulk are concentrated in Mexico and the southern United States. The Yuccas fruit but rarely under cultivation, the large, white, pendulous flowers being (often) fertilised in the wild plant by a moth of the genus Pronuba. *Y. baccata* and *Y. brevifolia* are large trees, and the former has an edible fruit resembling the Banana. *Dasylirion* and *Beaucarnea* resemble *Yucca* in habit but differ in flower. *Herreria* belongs to temperate South America, is a shrubby climber, with the habit of *Smilax* or *Dioscorea*.

— BRILLIANCY OF COLOUR IN THE CHINESE PRIMROSE.—This is finely illustrated just now in one of the plant-houses at Chiswick, in the case of that peculiarly rich coloured variety called by Mr. BARRON, Chiswick Red. There is nothing in the collection which can touch this for its peculiar hue of rich colouring; it is by far the nearest approach to a true red Chinese Primrose we have yet seen. One excellent characteristic is its admirable habit, the leaves being much lacinated, dwarf in growth, and foliage hard and wiry, and quite distinct from others. It causes the old purple types to look quite pale and colourless. The Chinese Primrose has been termed the "Advent Flower," and "the first Primrose of the Christian year," and the designation is a correct one. It seems to throw a gleam of dawn across the darkest gloom of the late autumn months, prophesying of what shall be. The varieties Chiswick Red and

rubro-violacea, raised by Mr. BARRON, have passed into the hands of Mr. B. S. WILLIAMS for distribution, but Mr. BARRON has reserved one or two plants of each, in order to maintain the completeness of his collection.

— DESTRUCTION OF TREES BY THE GALE OF DECEMBER 28.—MR. WILLIAM THOMSON, of the Tweed Vineyard, writing to the *Scotsman* on the 19th inst., states that the peculiar violence of this gale in certain localities is well illustrated by the havoc it has made amongst the fine timber in Keir Park, near the Bridge of Allan. The grand *Araucaria imbricata* was blown down, and all the roots torn out of the ground except a few on one side. A staff of men from one of the Edinburgh nurseries set it erect again, but Mr. THOMSON fears their best efforts to make it take root and flourish as in the past will be of no avail. "The destruction of this grand tree," says the writer, "is a sort of national disaster. It was, as far as I know, by far the finest specimen in Scotland; its height, or rather its length as it lay, was 44 feet 4 inches, and round the stem near the soil, 5 feet 4½ inches; 3 feet up it was 4 feet 4½ inches. Many other fine trees were prostrate—one splendid tree of *Abies nobilis*, which was also to be raised, but I fear with doubtful results. The whole park seems to have come in for the full violence of the gale. 1600 fine large trees were either broken over at from 10 feet to 20 feet from the ground as if they had been saplings, or blown over, raising by the leverage of their heads masses of heavy soil of several tons weight in some instances; and what both myself and Dr. PATTERSON, who accompanied me, were much struck with, was the circumstance that the wind seems to have blown in sort of "bolts" through some of the plantations, and swept all before it. On the grounds of Mr. STIRLING, at Kippenross, on Sheriffmoor, there were thirteen acres of Fir trees nearly all prostrated by the same gale."

— DOUBLE PITCHER.—Last week we figured a case of two pitchers on one stalk, the two pitchers being quite separate, though with a common support. This week brings us another *Nepenthes* from Messrs. VEITCH, in which the union has gone still further; not only are the stalks blended, but the pitchers are also combined into one common receptacle, leaving only the two lids free. The resemblance to the double cup of HOMER is even closer than in the specimen before referred to. It is somewhat remarkable that, to the best of our knowledge, there is no record of any erratic pitcher-plant until that we published some time ago. Since attention has been drawn to the matter several specimens have been sent to us. Of course this is in a great measure due to attention not having been previously given to the subject, but partly also to the increased growth of these plants and their enhanced degree of development under cultivation. At present the matter is of no practical importance, but there is no telling what may come of it.

— AUCUBA SUPERBA.—This is the name of a large-leaved handsomely variegated variety raised by Mr. A. CLAPHAM, of Scarborough, and which is now to be seen in the gardens of the Royal Horticultural Society at Chiswick. The leaves are covered with cream and bright pale green on a dark green ground, the colours clear and distinct, and the stems of the plant are marked in the same way. The leaves are fully 10 inches in length, and broad in proportion.

— RARE AND NEW MOSSES.—At the monthly meeting of the Manchester Cryptogamic Society, held on January 19, the President (Mr. WHITEHEAD) exhibited a specimen of *Coscinodon cribricosus*, which the Rev. J. FERGUSSON, in the current number of the *Naturalist*, describes as an immensely interesting addition to the British flora. The moss was collected so long ago as the year 1867, at Coniston, by Professor BARKER, of Owens College, but lay unrecognised until Mr. FERGUSSON quite recently detected it among a collection of British *Grimmia* which the Professor sent him. The President also exhibited a species of *Fissidens* new to Britain, viz., *F. serrulatus*, gathered by Mr. CURNOW near Penzance. It was distributed by Mr. CURNOW in 1872, mixed with *F. polyphyllus*, and appears to have been mistaken for that species, from which, however, it is quite distinct. A specimen of *Mnium spinosum*, for which Ben Lawers is the only known British

station, was exhibited; as were also *Plagiothecium annotinum*, and the various species of *Timmia*, British and Continental, of which only four are at present known. One of the species, *T. norvegica*, was from Ben Lawers, where, as stated in SCHIMPEK'S *Synopsis*, it was first collected by M'KINLAY. A collection of fresh gathered mosses from Malham and the neighbourhood, exhibited by Mr. CUNLIFFE, were a source of much interest. The species included *Zygodon Nowellii*, *Omalia trichomanoides*, and *Anomodon viticulosus*—the two latter with fruit. Mr. W. H. PEARSON exhibited specimens of *Diplophyllum obtusifolium* (HOOK.), detected amongst other *Hepaticæ*: collected by one of the members, Mr. C. J. WILD, at Alderley Edge, in May, 1878. It had previously been collected near the Manchester district, at Delamere, by the late Mr. W. WILSON and Dr. CARRINGTON. Mr. PEARSON also exhibited specimens of *Metzgeria hamata*, collected by Mr. E. GEORGE, of London, last July, near Arrochar, Scotland.

— TREE LABELS DIPPED IN KEROSENE.—A correspondent of the *New York Tribune* states that "tree labels dipped in kerosene will retain the writing nearly as long as those painted with white lead. Hundreds may be immersed at once. The oil enables the label to receive a strong broad mark of the pencil, which is not easily defaced."

— EPPING FOREST.—MR. W. PAUL'S paper at the Society of Arts on Wednesday evening last was almost too good. It is in a measure aggravating to have to assent to all that a public speaker has to say. Not that the tendency to pick holes is to be encouraged as high art, but a little self-assertion and independence of judgment are at least desirable, provided they be not offensively obtained. The weak point in Mr. PAUL'S paper, as we heard it read, seemed to be excess of caution—a fault on the right side no doubt, if a fault at all. While agreeing with him in the main, that the let-alone policy—subject to necessary drainage, maintenance of roads, walks, open spaces—is the best, we yet think that with some dozen miles in length and four or five miles in breadth; and with considerable diversity of surface and circumstance, there is room for more ornamental, and especially experimental, planting than Mr. PAUL'S great caution led him to recommend. The caution is, however, the more commendable, seeing how woefully deficient foresters and planters generally are in the knowledge of the resources open to them in the way of hardy trees and shrubs, and, indeed, of any plants beyond the ordinary occupants of the routine planted garden.

— THE WEATHER.—General remarks on the weather during the week ending January 26, 1880, issued by the Meteorological Office, London:—The weather during this period has been very dry and the sky, on the whole, moderately clear in nearly all parts of our islands; in Ireland, however, it had become dull, squally, and rainy by the 26th; haze or fog prevailed at many of our south-easterly stations. The temperature was 3° below the mean for the time of year in "Scotland, E.," 6° below in "England, N.E.," and "Scotland, W.," and as much as from 7° to 10° below in all other districts. Over the inland parts of England the lowest of the minimum readings were registered at most stations on the 20th, but a second very low reading was observed in some places on the 26th. Over Great Britain the highest of the maxima occurred on the 22d, but in Ireland the mildest days were at the close of the week. The wind during the greater part of this period has been generally light from east in the south; light to moderate, or fresh, from the south-east, and south in the west; and light from west to north-west in the north-west and east. By the 24th, however, south-easterly to easterly winds had appeared over all parts of the country, and though light in most places, blew with the force of a strong breeze or moderate to fresh gale at some of the more exposed stations in the west and north. The rainfall, except in "Ireland, S.," was scarcely appreciable.

— GARDENING APPOINTMENTS.—We hear that Mr. J. VELOT, late principal Foreman to Mr. GILBERT at Burghley, has been appointed Head Gardener to Lord BRAYBROKE, Audley End, Saffron Walden.

## GUNNERSBURY PARK.

THE manor of Gunnersbury, called in the old records Gonyldesberry or Gonyldesbury, held under the Bishop of London, is stated in the *History and Records of Ealing*, to be of ancient date, and "it is not improbable that it was the residence of Gonyld or Gunilda, niece to King Canute, who was banished from England in the year 1044." In the year 1378, a survey of the manor was taken by order of the Crown, when it was described as "the manor of Gonyldesbury, with the appurtenances, in the parish of Yellyne, in the county of Middlesex." It would appear from the foregoing records that it was from time to time the residence of eminent persons, one of them being the celebrated Serjeant Maynard, who conducted the evidence against the Earl of Strafford and Archbishop Laud, and was called to the degree of Serjeant during the Protectorate of Oliver Cromwell.

The present mansion (see p. 145) was built by Alex. Copeland, Esq., and at his death it was purchased by the then Baron de Rothschild, and is now the residence of the Baroness de Rothschild, widow of the late Baron Lionel, who in his lifetime considerably augmented the estate, and made great improvements in the mansion and grounds. The mansion is a handsome specimen of the Tuscan order, the south front, which is seen in the accompanying engraving, is 126 feet long, and consists of a centre and wings. The terrace at the front of the house is bordered by a dwarf wall and stone coping, and ornamented with vases. At the east end of this terrace is an alcove, in which is placed the statue of Apollo. The west side is bordered by an architectural archway leading to the gardens. On the west, at a little distance from the house, is a handsome temple of the Tuscan order, supported by two pilasters and two columns. On the tympanum of the pediment is a shield with foliage. The interior is chastely arranged and beautifully furnished with Chinese vases, antique chairs, &c., and the walls are ornamented with bas-reliefs, representing the most striking scenes in the history of Greece. From the south front of this temple is obtained an extensive view of the surrounding country, including Kew Gardens, and the Surrey hills in the distance. This spot is the most elevated part of the grounds, as well as the most beautiful, and is further ornamented with a circular piece of water, consisting of about 2 acres. This part of the gardens is thought to show evident marks of the hands of Kent, who was employed by a former proprietor, Henry Turner, Esq., between 1740 and 1756 for the purpose of embellishing the grounds and improving the landscape. Groups and lines of Cedar of Lebanon, trees of magnificent proportions, but bearing marks of the war of the elements, here and there raise their majestic heads—planted, it is thought, during the time the grounds were in the possession of Serjeant Maynard.

The Italian garden at the back of the temple was formerly embellished with eight figures in sandstone of Burns' "Jolly Beggars," admirably executed by Thoms: they were brought from Scotland to London for the purpose of exhibition, but the speculation proving a failure—they were put up for sale, and purchased for £200 by the father of the late Baron. They are of the size of life, but having become injured by time they now occupy a less exalted position in the grounds.

The view of the front of the mansion and the grounds, given on p. 145, is taken from a point below what is known as the Horseshoe Pond, from its peculiar shape. On the right are some fine examples of the Horse Chestnut, and nearer to the mansion, but occupying a somewhat foremost place, is a fine specimen of *Ame-lanchier vulgaris*, which is an object of considerable beauty in spring. Just across the water on the left hand are some handsome Beeches, and beyond and near the residence a group of three splendid Elms, supposed to have been planted about the same time as the Cedars of Lebanon. Ivy does well under the spreading and dense foliage of the Beeches, and it is largely used at Gunnersbury for furnishing spots under large trees. From the terrace a delicious piece of greensward falls down to the water, which in summer is well furnished with fine clumps of white Water Lilies, a good form of it obtained from Holland House.

A conspicuous feature on the terrace in summer is made by some specimen plants of the old *Fuchsia corallina*; it has reddish tube and sepals, and a paler coloured corolla, and though a fine old-fashioned sort

is yet prized by Mr. Roberts, because of its excellent drooping habit and great freedom of bloom. In summer also the fine specimen Orange trees found in the orangery are placed on the terrace. On either side of the glade are specimen Portugal Laurels advanced a little beyond the front line of the trees, and these occupy the centre of beds that are filled with subtropical plants in summer. Round the edge of the water are fine clumps of Pampas-grass.

From this point a winding path leading westward takes the visitor by what years ago must have been a group of six magnificent Cedars; some yet stand in all their majestic proportion, two or so have succumbed to the assaults of time, but, like the brave old English Oak the others stand in their pride and glory yet. Under these there is a dense carpet of the large-leaved Irish Ivy.

Close by is the orangery, which is on the south-west of the mansion, a commodious and imposing building 60 feet long, with a projecting circular front and nine big windows, embellished with large Chinese vases. The collection of Orange trees is mainly made up of the Mandarin, of which there are several fine specimens in tubs, with large and well furnished heads of elegant foliage; the fruit is found very useful for dessert purposes, the perfume they give forth being of a very decided character. Here, too, growing in large tubs that are sunk below the level of the floor, are the two huge Tree Ferns (*Dicksonia antarctica*), sent to the late Baron a few years since, the stems about 22 feet in height, and towering up to the roof. They were figured in the *Gardeners' Chronicle* in 1873, p. 545. The orangery forms in winter a very useful house for storing Palms, large Myrtles in tubs, Bays, &c., that stand out-of-doors in summer. There are also a number of succulents and other useful plants. Behind the orangery and attached to it, but of greater length, is another large house, which also serves as an orangery, being unheated, while the old flat roof destitute of glass has given place to a span-roof of glass. In this may now be seen four very large and fine specimens of large-leaved Oranges of great dimensions and excellent health, and six very large specimens of Myrtles, also in tubs. This house is 84 feet in length by 15 feet in width, has a brick floor, and is lighted from the west front by means of a wall of glass sashes which admits an abundance of light, while it is shaded and rendered cool in summer by the trees growing near it. Against the back wall, which is duly wired for the purpose, it is Mr. Roberts' intention to plant out a number of specimens of *Lapagerias*, red and white, and for this purpose a raised bed well constructed, 4 feet or so in height, in which the *Lapagerias* will be planted, and where they can scarcely fail to do well. It is also intended, as the wires stand out about 3 inches off the wall, to cover it with *Ficus repens*.

Leaving the orangery, a broad walk leads up towards the circular water; on the right is the mansion flanked with dense belts of shrubbery, which, while they protect the dwelling, and break the force of the westerly winds, give a finished appearance all the winter through, seeing they are largely composed of evergreens. Indeed, the presence of finely proportioned evergreens is one of the glories of Gunnersbury; giving an aspect of warmth, protection, and repose in winter, and coolness and shade in summer. On the left hand is a broad stretch of greensward, with a double line of flower-beds in the grass, each representing a locket when furnished with Roses trained across broad wire arched trellises as handles. Standing about on the lawn are fine examples of *Taxodium sempervirens*—this is especially well-proportioned; *Picea Pinsapo*, *Arancaria imbricata*, *Pinus excelsa*; some very fine Hollies, green and variegated, conspicuous among them being Waterer's Golden Queen and *marginata aurea*. There are also two plants of *Cupressus macrocarpa* of good size, but not in very good condition just now, having been injured by frost this winter and last. *Pinus insignis* is one of the grandest of coniferous plants for winter, as it takes on a fine colouring at this season of the year, but is liable to have its points cut down in winter, and in consequence does not grow into a handsome tree. There are also handsome examples of Box and other evergreens, and a fine bush of the variegated Yew, well coloured. *Abies Douglasii* does not do well at Gunnersbury; it is thought to be too near the effects of the smoke of London.

Round the ornamental water are numerous very fine clumps of Pampas-grass; *Eulalia japonica* varie-

gata has been tried two years, but the past winters have proved too much for it, consequently it can scarcely become a rival to the *Gynerium*. Round this water are fine trees, Cedars being conspicuous, also grand Elms; and with its huge spreading branches thrown across the water, is a Tulip-tree of great size, the leaves of which take on a great wealth of colour in autumn.

In order to hide an unsightly brick wall immediately in the rear of a belt of trees, Mr. Roberts has recently planted a bank of evergreen shrubs, which is wider at some places than in others: the subjects, he anticipates, will do well under trees. They comprise Yew, Box, Holly, Aucuba, Portugal Laurels, Rhododendrons, &c. As a rule the variegated Hollies do not keep their colour well under trees, or stand drip. A good deal of light and air will break in upon these shrubs on the wall side. Between the shrubbery border and the walk there is an irregular line of grass plots, on which specimens of *Yucca gloriosa* have been planted; eventually the grass will be replaced with Ivy.

The Rose-house is a very pleasing feature at Gunnersbury. The plants on the roof have so covered its interior that those in the centre bed made a great growth but produced few blooms. The Rose trees have all been taken out from the bed with the exception of those trained to the pillars which support the roof, and a hedge-like plant of Gloire de Dijon, trained along the middle of the bed its full length; and it is now planted with Ferns and Lycopods, *Dracenas*, *Yuccas*, &c., amid blocks of artificial rock-work. When this bed becomes furnished it will be charmingly effective and very useful for cutting from. This house will now be pruned twice a year, and warmth maintained all the year round. There is a raised border round the house, and against the walls Mr. Roberts has planted *Rogiera gratissima*, *Psychotria jasminiflora*, *Habrothamnus elegans*, *Luculia gratissima*, *Plumbago capensis*, and *Veronica Hulkei*. The whole line of the borders is to be edged with *Trachelospermum jasminoides*.

It is not now necessary to go further into details. Suffice it to say that during the spring of 1879 the spacious vineries were thoroughly cleansed and replanted, and important improvements added. The Orchid-houses are filled with plants in fine condition, and in the East Indian-house there is a collection of from sixty to seventy specimens of *Phalenopsis* coming into flower, and shortly there will be a grand and unusual display of their splendid blooms. *Cypripedium Hookeri* is also flowering; it is not a showy species, but yet very pretty, and the great freedom with which it blooms—quite small plants throwing up a considerable number of flowers—makes it very acceptable indeed as a winter-flowering plant. In the forcing and furnishing houses, as also in the forcing department, everything shows the evidences of an intelligent oversight. Many improvements are in contemplation that will give to Gunnersbury a higher reputation than it has yet enjoyed. At the south-west extremity of the park a very large space of ornamental grounds has been laid out with considerable taste and judgment. The bothies have just been re-arranged, in the interest of the comfort and convenience of the young men, and a bath-room, library, &c., added. Mr. Roberts deserves great credit for the valuable improvements he has carried out during the brief period he has had charge of the gardens—improvements that we believe are but the forerunners of others of a like valuable character. R. D.

## ORCHID CULTIVATION.

At a meeting of the Manchester Botanical and Horticultural Society, held on the 21st inst., under the presidency of Mr. Bruce Findlay, Mr. W. Swan, gardener to W. Leech, Esq., Oakley, Fallowfield, read a paper on "The Native Habitats and Culture of Orchids," of which the following is a summary, taken from the *Manchester City News*:—

Mr. Swan said he thought they were all more or less familiar with the characteristics and strong recommendations of the Orchid, for if there was any city in the United Kingdom where a knowledge of and acquaintance with this class of plants could be obtained, even if only of a cursory and imperfect kind, it was Manchester; and the public body who had materially assisted in thus increasing the knowledge and intensifying the pleasure of the great number who now delight to gaze upon such floral gems surely was the society under whose auspices

they were met, and to whom they looked for still further displays of Nature's productions—such productions being assisted and in some measure developed by the art of those by whom he was surrounded. Such was the wealth and prodigality of plants exhibited at Old Trafford from time to time, that it was possible now for visitors whose labours are in no way devoted to horticultural pursuits to become better acquainted with this class of plants than was possible twenty years ago to those whose whole time and attention were spent in gardening. A knowledge of the native homes and surroundings of plants which come under their notice might enable them to so arrange their method of treatment here as to meet their natural requirements as far as practicable. Orchids were found in numerous localities, including the slopes of the Himalaya, the damp jungles of Nepal and Bhotan, in the valley of Assam; in almost all the islands of the Indian Archipelago, in North America and the Western States, in New Granada, Brazil, Peru, Mexico, whilst our own country is the home of over thirty distinct species.

After describing at great length the circumstances under which Orchids flourish in localities of widely different temperature, he threw out a few suggestions as to the principles which should guide horticulturists in the cultivation of this plant. In the first place, the houses should be of a size and shape most suitable to the sections intended to be cultivated, the object in each case being to get the plants as near the light as possible without the danger of being scorched when the sun may suddenly burst upon them. The side stages of the houses should be so constructed that a layer of sand may be spread upon it, or, what he considered far better, small coke, which well holds the moisture poured on the stages, and at the same time allows any excess of water to pass quickly from the plants. The centre of the houses may be of a similar character, or a bed filled with tan with latticework over it will be found of great service to such things as Dendrobies and East Indian plants. Ventilators should be provided both at the top and bottom, those at the bottom being covered on the inside with perforated zinc, to prevent the entrance of birds and bees, and to make it the more difficult for snails to crawl in and commit the havoc they sometimes do. Good shading should also be used, and where movable rollers can be applied they should be provided, the shading to be run up when the sun's rays are diminishing in force and power, and the temperature in the houses allowed to run up 5° to 10° by the aid of the sunlight now at command. Whilst growing, all enjoy warmth and moisture, and according to the locality whence the plant has come will the amount of heat be that must be given.

When growth is finished a less amount of heat and moisture is requisite, and here again, according to the native habitat so will be the length of time that they will require for rest and the formation of flower-buds. Dendrobies especially will be benefited by a good season of rest, though even in this genus it will be found that many will be resting whilst some are in full growth, and others in full bloom. The utmost care and attention must be taken to keep the plants clean. Doubtless they suffer from the attacks of insects at home, but in our houses they appear to increase with such rapidity and persistence that unless great watchfulness and care be exercised the plants speedily become disfigured, and ultimately die away. In potting the plants care and cleanliness should be observed at every point. The pots should be either new or thoroughly clean; the crocks also should not be used twice without being washed. The sphagnum moss should be freed from all litter and grassy roots, whilst the peat, which should be of a very fibrous nature, should have all the sand and earthy matter shaken out of it as it is pulled to pieces. The greater part of the plants should be kept well up in the centre, so that the water may the more readily pass away from the rhizomes and young breaks. A point should be made of keeping the plants in pots as small as can consistently be managed, ever bearing in mind, of course, the health of the plant and the condition of the roots.

He discouraged the habit of cutting through the plants to induce a greater number of growths, for though the practice may succeed with a few sorts, great danger is often incurred, and instead of increasing the plant, a loss of bulbs and growths is often the result. All imported plants should be watered sparingly at the first, then, whether on blocks, in baskets, or fixed in pots, with crocks and charcoal, as

soon as the new roots push out and the breaks slit away a greater amount of water must be given, and every effort made to encourage quick and active growth. Attention to these principles, guided by the circumstances and situations that may surround those taking charge of a collection of these plants, will, if carefully carried out, result in rich displays of choice forms of beauty, and give much pleasure and happiness to those who may be privileged to gaze upon them.

A vote of thanks was awarded Mr. Swan for his paper.

### HOTHOUSES FOR INDIA.

DR. KING, the able and energetic Curator of the Royal Botanic Gardens at Calcutta, having determined to erect suitable glass structures in the various branch establishments in India, has instructed Messrs. Fletcher, Lowndes & Co. (Limited), 13A, Great George Street, Westminster, to design and construct a metal house to meet certain requirements which he submitted for their guidance. The first of these buildings, which is to be re-erected at Darjeeling, is now complete, and will shortly be sent out. The special features of the conservatory are stated as follows by the builders:—Dimensions: Nave, 80 feet long by 35 wide, by 18 feet high; transept, 45 feet long by 17 feet wide by 18 feet high. A dwarf wall, 2 feet 6 inches high, of brick or stone, 9 inches thick, extends all round the building, with iron gutter and coping and 14-inch piers every 10 feet 2 inches. Iron flap ventilators (for bottom ventilation), each 2 feet 6 inches long by 12 inches high, thirty-two in all, form panels between the piers, from which latter spring the main tubular ribs or girders carrying the curvilinear nave roof of one span.

These ribs have been placed outside the glass. This arrangement gives a bearing every 10 feet for placing scaffold boards upon in case of any external repairs being required, and at the same time removes all internal obstructions except the wind ties which lie close up under the glass. The wind ties are made extra strong, to withstand the exceptionally heavy storms which are experienced in the hills. The astragals, or glazing bars, are of lead, thus obviating the necessity of using either paint or putty; two zinc clips at the top and bottom of every pane hold the glass, part of which, extending to a height of 8 feet 6 inches, is 26 oz. British sheet, and from that height to the roof ridge is Hartley's 4-inch rolled; the latter has been adopted to form a screen from the intense rays of the sun, and as being better adapted to stand without fracture the heavy hail-storms to which it is likely to be subjected.

Top ventilation is provided for by twelve sashes, each 4 feet long by 3 feet 6 inches wide, hinged on to the ridge, the whole or half of which can be simultaneously opened by one man in two minutes by means of a hydraulic apparatus specially designed for this house, and the registered adaptation of which is claimed by Messrs. Fletcher, Lowndes & Co. The transept consists of upright framed sides and front, 8 feet 6 inches high from the ground, glazed with 26 oz. British sheet glass, with a handsome moulded gutter forming a cornice round the top, from which spring the tubular ribs or girders carrying a single-span curvilinear roof, glazed with Hartley's rolled glass, and dying into nave roof. The doors are the only wood-work in the structure, and consist of four pairs, each pair being 4 feet wide by 8 feet 6 inches high, placed at each end of the nave and transept.

The nave ends are flat, with four wrought-iron columns supporting a cast-iron fascia, and with perpendicular T iron astragals, backed by trussed stays, to withstand the pressure of the wind. The transept ends are flat, with four plain wrought-iron columns faced with ornamental twisted columns to support the cornice gutter, the ends of the curvilinear roof being formed of T iron astragals radiating to cast-iron fascia, and supported internally by means of struts and bracket, to withstand the pressure of wind. Cresting finials of ornamental cast-iron extend the entire length of both roofs, and five handsome cast-iron finials surmount the centre and four entrances.

THE ALEXANDRA PALACE.—The Directors of the London Financial Association advertise the Alexandra Palace and Park as "to be let on lease" from and after May 5 next.

### Home Correspondence.

**Primula farinosa.**—This pretty little native plant, the Bird's-eye Primrose, called also the Mealy Primrose, because the crown and the under sides of the leaves have the appearance of having been sprinkled with meal, is not often seen in cultivation, perhaps because it is not well understood. It may be useful to know how it grows at home. It is abundant in some spots in the neighbourhood of Grange, in North Lancashire, and is a true bog plant in its habit. Water not far beneath its roots at all seasons seems to be an indispensable condition in the selection of its native habitat. It is not found in the peat mosses which abound near here, but it prefers that black spongy bog soil, such as is found where streams pass through long stretches of level ground, where it is often submerged in winter. It is not a mountain, but a lowland plant. It grows in great profusion round a certain small mere, not 50 feet above the sea level, either on the top of those round hillocks so common in boggy spots, or in the greatest luxuriance on the edges of the trenches dug to drain the surface, which are always full of water to within a foot of the ground level. Large tufts grow just overhanging the brink of these, having often seven or eight crowns and bearing flower stalks more than a foot long. In these exposed places it is alternately soaked and frozen through the winter. The roots are short and spread superficially, seldom extending an inch below the surface. It grows often almost amongst reeds and sedge, and close to such plants as *Parnassia palustris*, which abounds in the same spot. It seems, however, to thrive in the rich retentive loam of the gardens here without any special care; but I feel sure it would appreciate a thick sod of bog soil and a saucer of water plunged a few inches beneath its roots. A few years ago a large mass of this plant attracted notice when in flower, colouring the London and North-Western Railway cutting close to Carnforth station. The cutting had recently been faced with sods from a bog between Carnforth and Lancaster. I believe the plant has now disappeared from the railway bank. *C. W. Dod, Grange-over-Sands, Jan. 23.*

**Soot on Boilers.**—One would hardly have expected that a practical man like Mr. Challis, having to do with boilers in use for heating horticultural buildings, could have thought necessary to put such a question as the one he does in regard to the above, as any one who has done such stoking knows how difficult it is to drive caloric through the sides of a boiler encrusted with soot. If flues and tubes could only be kept clear of this deposit the coal bill in most places might be lighter than it is, for, instead of the waste that now takes place through the fire not being able to impinge directly on the metal, it would liek around and about it with its many tongues, instead of threading its way through partly choked passages in its course to the shaft, and on into the outer air. If it were possible I would have the iron kept quite bare, as it is a well-known fact that newly-set boilers heat much more quickly with less fuel than others which have been in use for some time, especially when smoky coal is burned—a clear proof that soot in a great measure prevents the heat getting through to the water. This is why it is that coke answers so much the best in tubular boilers, and I have always found that a large percentage of this is the most economical fuel to use, simply because it is cleaner, and leaves less deposit after being consumed. *J. S.*

**Odontoglossum vexillarium.**—There has been a great deal of discussion of late about the distinct varieties of this Orchid, and I think that the easiest way to define them is to name them after the collectors who discovered them. Baumann found *O. vexillarium* first, and near Frontino; since he sent his batch home many collectors have forwarded them to England. The one which grows near Frontino varies much, and grand varieties have been sent from there; light and dark coloured grow together: these could be called *O. vexillarium*, Baumann's variety. A very short time after him Wallis found the grand variety which he sent as coccinea to the Continent; he

collected it near Souson in Antioquia, and there it is still to be found, but it is so rare that it does not pay importers to send for it. The Souson variety is dark only, and varies little; it is totally distinct from the Frontino variety, and might be called Wallis' O. vexillarium. A few years passed, and the late Franz Klaboeh discovered the splendid variety which flowered with Sir W. Marriott first, and which is totally distinct from either of the above; its eye is very white and peculiarly well defined, and although not so dark as the one which Wallis sent home first, it is of an extraordinarily pleasing colour, and altogether different from any other. He found it on the Cauca River, and where it is to be met with very sparingly indeed; there is never a light coloured one among these, and the variety very distinct: this might be called Klaboeh's O. vexillarium. Localities yields us the different varieties of Orchids in O. vexillarium, the localities keep them very distinct indeed, and the matter is easily defined! Baumann's or Frontino variety, light, and the grand dark coloured large flowering varieties mixed; Wallis' or Souson variety always very dark; Klaboeh's or Cauca variety dark and rather small flower, but very beautiful. *F. Sander.*

**Sternbergia lutea.**—The correspondent who signs himself "A." cannot have read attentively what I wrote respecting the above, for instead of speaking of it as a spring flower, I remarked on its naturally early blooming qualities, and cited in proof of the same, that no sooner had the snow disappeared from off the surface of the earth than its blossoms were to be seen peeping out amongst the foliage, and that it appeared a race between the Sternbergia and Christmas Rose as to which should be first. The plants I alluded to, as being harbingers of spring, were the Aconites and their immediate followers, most of which are only now waiting for the warming influence of a little sun to cheer us with their presence. *J. S.*

**Globe Artichokes.**—After such a severe winter as the one we are now passing through, the death-rate of this valuable esculent is certain to be very high; in fact, it is more than probable that in those places where the thermometer has been below zero, they will be totally destroyed. There is, however, a remedy; and to those of your readers who don't like the idea of being asked for what they are not able to supply, I would say, sow seed at once in heat, pot off when large enough, shift into larger pots when necessary, and plant out towards the end of April. The result will be a nice crop of medium-sized heads fit to eat in the autumn; and as "half a loaf is better than none" so it is with the above. *J. H., Heytesbury.*

**Grape Vine.**—I some months ago asked a question through the medium of this journal respecting the Grape Vine and its bearing two crops of fruit in the same year. Yesterday I received a most kind letter and a magazine entitled *The Australian*, from Sydney, sent by Mr. Robert Whibley, the Editor, stating that, having devoted many years to the culture of the Grape Vine both in this country and in Australia, and that he will always be pleased to answer any questions regarding it. Mr. Whibley also says that the Vines in New South Wales give, as a rule, two crops yearly, and that in Queensland the second crop is but very little inferior to the first. When Mr. Whibley resided in the North of England he occasionally found the laterals showing a second bunch of fruit upon the Lady Downe's Grape Vine, and he thinks high cultivation, together with a warm climate, will cause any Vine to give two crops a year. [Doubtless.] Mr. Whibley is still a cultivator on a large scale, growing a quantity of Grapes for wine-making as well as for table.  *Helen E. Watney.* [The Royal Ascot was what the late Mr. Standish called a perpetual bearer, the laterals three or four series in succession producing fruit; but of course the "perpetual" idea, that is a continuous crop, was only an over-sanguine picture of the imagination. *Ebs.*]

**Imported Lily of the Valley.**—I was much surprised to see the great difference in the earliness of German roots of these as compared with others imported from Holland, the latter being quite a week behind the former, although potted the same day and treated together precisely alike in every way. Not only were the German kinds earlier, but the crowns were considerably larger, they being so plump and strong as to have more the appearance of those of Solomon's Seal, which in colour, too, they greatly resembled. Comparisons of an unfavourable kind have sometimes been drawn between pots of English grown Lily of the Valley and those above-named, but it should be borne in mind how superior are the varieties they grow, to such as we generally see in gardens, where in many cases the stock at first stating has been obtained from the woods. It will be found that the flowers of these are always much smaller, with the edges of the bells serrated, whereas those of imported plants are regular and plain. That Lily roots can be grown here just as well as abroad there can be no

question, but to do this we must start with the right kind; and I would recommend all who have spurious sorts to root them out and force them, that fresh beds may be made of those to be had from Germany, which as yet are the best I have seen. Some years ago Mr. Wills, of Onslow Crescent, was having large numbers from the South of France, which in the massiveness of the spikes and size of the individual blossoms appeared almost equal to what the Germans produce, and any one, therefore, who may get these will probably possess the same kinds, which may be distinguished by the crowns being of a purplish red instead of green like the Dutch. To grow Lily of the Valley really well it must have ground specially prepared, and not be planted, as is often the case, in out-of-the-way places under or near trees, the roots of which soon find their way into the beds and rob them of their richness and moisture. Being a native of woods it is naturally fond of partial shade, although if plenty of water can be given this is not essential; but what is of importance is that the soil should contain plenty of vegetable matter, such as decomposed leaves or refuse peat, a mixture in which Lily of the Valley greatly delights, as in it the stolons can run freely and the fibres find the food they desire. A good place to form the beds is under a wall facing away from the sun, or down between rows of Apple trees, the roots of which, by being some distance off and going down deep, do not interfere with the Lilies. These latter feel very much nearer the surface, and therefore in making the beds all that is necessary is to prepare the top foot or so, which should be thoroughly broken up and have the leaf-mould and peat or stuff from the rubbish-heap thoroughly incorporated with it, and if at the same time any mild rotten manure can be added all the better, but if not this latter can be used to great advantage as a mulching later on after planting, when it will be of benefit not only to enrich the soil but to assist in retaining the moisture, of which, if the drainage is good, Lily of the Valley cannot well have too much. By preserving the leaves and taking care of the plants forced they come in admirably for forming any beds it may be desirable to make, but when intended for this purpose they should be kept under cover in frames and properly hardened off previous to being exposed. Although good crowns cannot be expected the first year from these they may with confidence be looked for the second, when there will be quantities fit for lifting and potting. In turning any out that have been forced the best way is to plant the ball entire, without any disturbance, as once the roots get their liberty they soon spread and ramify through the whole of the ground, provided they are not put in too far apart. A foot or 15 inches is quite space enough, but if single crowns are made use of half that distance is better, the rate of increase of these being much slower, on account of the way they are denuded of side growth. To get beds quickly and have flowers to pick the same season the imported tufts should be grown, as most of these contain six or eight crowns that are large and strong enough to bloom, and many others that will do so the year following. In order to increase the size and strength of these, liquid-manure should be given twice or thrice during the growing season, and every autumn after the decay of the leaves a top-dressing of rich stuff scattered over the beds, which will encourage surface roots and prevent sharp weather from having any injurious effect on the plants. To have a good stock of these in readiness for forcing, in case of a long continuance of frost, it is always advisable to dig up as many as are likely to be wanted before winter sets in, and to put them in the boxes or pots, which can then be stood in cold frames, where they come gradually on and produce foliage with the flowers, a thing they rarely do when hurried on out of their ordinary course. Instead of pulling them to pieces to pick out the strongest and best crowns, except for special purposes, I like the clumps just as dug up, the leaves being always acceptable, as they are particularly choice and beautiful with their delicate green tinge, and impart a more dressed appearance to a vase than any other foliage that can be used, except that of Ferns, which associates well with most flowers. *J. S.*

**Bees as Fertilising Agents.**—On visiting Combe Abbey recently, I witnessed a novel and somewhat peculiar method of setting Peaches adopted in the gardens there. In an early house, a hive of bees, apparently in the best possible spirits, were busily engaged among the flowers, and to the uninitiated in the habits of that industrious and interesting insect, in unpleasant proximity to a visitor. My guide, however, assured me that they were too much occupied with the work in hand to resent intrusion; I, therefore, watched their movements with some degree of interest. The blossoms were fairly developed, and the bees flying here and there, from flower to flower—the hum and buzz forcibly reminding one of the pleasant days of June. I did not observe any of them, in any way, attempting to escape from the house, but all seemed perfectly at home and contented with their quarters. On inquiry, I ascertained that

the hive similarly employed the last and for the two previous years, was the first to swarm, and moreover produced the largest amount of honey. From this, I should think, any practical reasoner may deduce that such treatment is not in any way deleterious to their health or productiveness. Without questioning the utility of the various modes of setting early Peaches, or the necessity for so doing, I would venture to remark that the plan adopted at Combe is a safe and practical method: safe, because the bees moving among the flowers can do no more harm under artificial conditions than in a natural state—and practical, because they take advantage of the least gleam of sunshine, and even in the absence of that, when the flowers are at all tempting, they will greatly aid the process. Reflecting on this ingenious mode of fertilisation, the question presents itself for one's consideration—is it necessary? Will Peaches set well, unaided, during the dull sunless weather of an average January? And further, supposing they are surrounded with all the necessary conditions for that important function, namely, a fairly dry and genial temperature, is there sufficient vitality in those delicate organs of fructification, in the absence of sunlight, to effectually distribute those minute particles of pollen so vitally necessary for a perfect fruit? If there is not, how best can the want be supplied? This at Combe has been put to the test, and if enormous crops of well-formed fruit in the early houses, compared with average crops where bees have not been placed, is any proof—*verbum sat*. No doubt, many of your readers have their own peculiar methods of setting their Peaches. Some advocate the orthodox camel's-hair brush, while others again are of opinion that a little tapping on the branches of the Peach trees, when the pollen is ripe and the sun is out, is the better method. The former is a tedious, and too frequently a questionable proceeding, because if the operator judiciously attempts the removal of the pollen, instead of aiding the process, he will probably injure those vital and delicate organs. The latter method certainly has simplicity and expedition to recommend it, but unless the operator is unusually observant I do not see how he is to know when the pollen is exactly fit for the operation. Bees, on the contrary, are safe, and will not approach the flowers until they are fully developed, as may be seen by their always being smothered with dusty pollen. In describing what I have seen I by no means wish to infer that this plan is the best for the purpose; but certainly until I hear of a better I shall think so; and it would no doubt be interesting to many, and especially to those who, like myself, are comparatively young in the profession, to hear the experience of others on this very important subject, founded on practice, if the matter could be discussed in a spirit of fairness, and not simply from the love of contradiction—a practice which too often culminates in the use of terms more forcible than euphonious, and designed rather to promote personal irritation than to discover the best methods of practice. The introduction of personalities cannot be too severely condemned by those who read for instruction. Any one who visits Combe may see the bees at work, and, like myself, will no doubt be treated with the greatest courtesy, and perhaps they too will have a word to say about the system of using bees as fertilising agents at Combe Abbey. *T. J. A. Brechley.*

**Brussels Sprouts not Sprouting.**—I am sorry to say that our Brussels Sprouts are in a similar condition to those of Mr. Fish. Half of our plants were raised in a cool orchard-house, and pricked off into a carefully prepared bed, previous to their being planted out, and the other half sown in beds in an open border in March and transplanted from them, and in both cases they have failed to sprout, or nearly so, and seem inclined rather to form heads after the manner of small Cabbages. The only way I can account for them refusing to sprout or button is owing to last season being so cold, short, and wet, coupled with the want of heat and sunshine, all of which tended to "arrest development." The varieties are imported and Scrymgeour's Giant, and both have failed alike. *W. Jamieson, Elchies, N.B.*

**Selected Potatos.**—One reads with pleasure the testimony of such an experienced experimentalist as is Mr. K. Fenn, as to the nature or value of "Improved Potatos." As that gentleman has devoted almost a lifetime to the consideration of all that relates to the Potato, no doubt his testimony will secure more consideration than will be accorded to any one who has some pecuniary interest in setting up a theory that experience proves to be utterly fallacious and valueless. As long as a stock of Potatos is kept true—that is, free from all mixture with other kinds—no form of improvement can be produced in its intrinsic character. If planted in good soil the produce will or may be large; if in poor ground it will probably be small, but relatively seed tubers of the same size from both stocks will show little difference in reproductive powers, if any no doubt in favour of those

grown on poor soil, as these will be found to contain more starch. One well-known grower I know holds to the belief that seed-tubers for the production of a fine stock should be selected only from the strongest roots. This is, however, but another way of putting what is a well understood axiom in Potato culture, that the produce of a plant is relative to the size of the seed-tuber. To show how little there is in such a belief, it is enough to say that if a dozen good seed-tubers are selected from one prominent root growing amongst a dozen others, and these be planted the next year, the very same feature—one or two extra strong roots—will again be found; so that it becomes evident the imagined improvement is more accidental, or the product of extra manuring, than due to any other cause. Whatever may be done with a dozen roots, however, it is absurd to suppose that any such selection could or would be carried out with the produce of acres. Rogues may and should be eliminated, but all plants that are true to stock will so remain. Some persons have from time to time assumed that the Potato sports to an improved form, but this is utterly incorrect. The Potato does not sport, and only those who have found some rogues amongst their stocks that were apparently better than the stock kind have jumped to the conclusion. This assumed sportive element is responsible for not a few of the *aliases* that prevail amongst Potatoes. New and distinct kinds can only be originated from seed, and then only really distinctive kinds come where cross-fertilisation has taken place. In the multitude of Regents, Lapstones, Ash-leaves, &c., that have been from time to time pushed to the front—if seedlings at all—we have had but mere natural seedlings that have shown the same features as the seed parent only and nothing more. Even these have shown little or no improvement, and there does not exist at present any better Lapstone than the old original cobbler's, or Ashleaf than one of the oldest of all the early season. Few plants are more amenable to intercrossing, few more easily operated upon than the Potato, and it is only when genuine efforts in that direction are carried out that "improved" varieties follow. The *Magnum Bonum*—now so deservedly popular—is a product of the American Rose crossed as believed by Victoria. That it must have been crossed there can be no doubt, as, with the exception of Superior, I have never known any one single American sort to produce seed-pods unless crossed with some English kind. No kind of cultivation, however, will induce *Magnum Bonum* to change its character; it will be that, grown where it will and how it will, until it some day passes into oblivion. The same may be said of all other assumed improved kinds, and anything asserted to the contrary is calculated only to throw dust. No doubt all these terms and phrases are strictly moral and business-like, but they cannot but deceive some persons. Probably most people, however, have ere now learned to estimate them at their proper value. *A. D.*

**American Arbor-vitæ.**—A carrier in this district used to come to our nursery for pieces of this to give his horses who were troubled with worms, and he stated that an overdose had once caused a mare of his to slip her foal. The inference would be that, if not absolutely poisonous, it would be better to keep cattle away from such plants. Yew, if eaten green sometimes, produces no harm, and yet at other times cattle die from browsing upon it. *George Burgard, Maidstone.*

**Number of Men Required in a Garden.**—Similar inquiries to that made by "W. A. C." at p. 122 have been made before, and like those of "W. A. C." much too vaguely to be satisfactorily answered. The labour question is very frequently a vexing one, and, generally speaking, the amount provided is not equal to the requirements of the garden. Under such circumstances the mind of the managing gardener is continually harassed in arranging what must be first done and what can be best deferred until it can be overtaken, and then perhaps not unfrequently has to endure the heartrending, if not scornful inquiry, why such and such a little matter has not been attended to before? In determining the number of men required for a garden about the extent mentioned by "W. A. C.," much depends upon the nature of the soil, the requirements of the family, and the manner in which the grounds have to be kept. Given an ordinary garden, with no demands beyond that of a good family and a fairly-kept place, twelve men might be sufficient, with a couple of women in the summer for weeding purposes; but if the grounds are well laid out and planted with choice shrubs, Rhododendrons, Roses, &c., which require more attention than Laurels and other common shrubs, with a fair proportion of flower-beds, and the whole to be in first-class keeping, extra help may sometimes be needed. No mention is made by "W. A. C." of plant or fruit-houses, which in a garden of this extent may be numerous, and will require men in proportion to their number, the nature and condition of their contents. The demand for fruit, flowers, plants for furnishing, flower garden, &c.—these I have not

provided for in the estimate I have made after many years' extensive practice. *An Old Subscriber.*

**The Orchard House** (see Enquiry at p. 99).—A correspondent makes certain enquiries about the orchard-house, which are placed in the following order:—1. The best position. A site must be chosen unshaded by trees or high buildings if possible, and it ought to be placed so that a maximum of the glass surface is exposed to the sun. 2. The best form and size. I certainly prefer the span-roofed form, but the size would be immaterial. Our orchard-house at Loxford Hall is 54 feet long, 24 feet wide, and about 12 feet from the floor line to the apex of the roof, and no house need be wider or higher than this. The internal arrangements are very simple, and comprise a row of shelves all round the house, and also a narrow shelf over the paths for Strawberries; we can winter about 800 6-inch pots with Strawberry plants in them, but there is only sufficient space to fruit half as many as that. The fruit trees are arranged on a bed in the centre; there are also borders round the sides and the ends, except where the doors are placed at each end under the apex of the roof. The borders are wide enough for one row of trees only all round, and in the centre bed we place three rows. The paths are of gravel edged with tiles, the borders being covered with clean cocoa-nut fibre refuse, and bricks are placed under the pots to prevent the roots getting out into the borders. The house runs east and west, and the trees are well exposed to the sun. The late Mr. Rivers, of Sawbridgeworth, describes a small span-roofed orchard-house as being 14 feet wide and 9 feet high. In a house of that size the path should be in the centre, and two rows of trees arranged on each side. The next best form to this is the half-span, with a path under the ridge; 14 feet would be a suitable width for a house of this kind, and it should be 10 feet high. One row of trees would be placed on the border at the back of the house, and three rows on the front border; the aspect of it should be as near south as possible, and I would prefer south-west to south-east. *J. Douglas, Loxford Hall.*

**Art in the Conservatory and Greenhouse.**—In the admirable paper by Mr. Adams on "Art in the Conservatory," it seems to me that he accords but scant justice to architects, gardeners, and horticultural builders, who have with very considerable success laboured in this direction, as witness the many beautiful conservatories and greenhouses to be found in almost every part of the country. I observe also that he quotes Mr. Hood's rule for obtaining the proper quantity of piping to keep up a given temperature. (See *Hood on Warming and Ventilation*, 5th ed., pp. 116, 117.) There are elements of incorrectness in this rule which should be guarded against, as any one may see if they apply it in a test case. The discrepancy between the rule and the short method given by Mr. Adams, both for stoves and for early vineries, may be tested in this way. Take an early vinery 30 feet long, 20 feet wide, 1 foot of wall above floor level, and 3 feet of upright glass, allow an angle to give, say 14 feet of rafter, giving a superficial measurement of 1340 feet; allow 140 feet for woodwork, and we have 1200 feet of glass. Proceeding by the above rule, we multiply by 14 to find the number of cubic feet of air to be warmed per minute = 1500. Now, say, for an early vinery to be started on December 1, and to be kept up to 70°—while, as we had, last year and this year, the outside temperature below zero, we must count upon 70° of difference between the external and internal temperature—then  $125 \times 70 = 8750 \div 130 = 67 \times 1500 = 100,500 \div 222 = 452$  feet of 4-inch piping (I drop the fractions) to heat a vinery 30 x 20. Now, taking the other method of the cubic content,  $30 \times 20 = 600 \times 9$  (average height) = 5400  $\div$  20 (number of cubic feet to 1 foot pipe) = 270, little more than one-half the quantity. There must be something radically wrong here, when by one rule we get 452 feet as the proper quantity of piping, and by another rule 270 feet. The other point I want to direct attention to is where Mr. Adams says that the best aspect of a span vinery is east and west. We have always looked upon it as a kind of axiom that a span vinery should be placed north and south, in order that both sides might get the sunlight in nearly equal degrees, and that if placed east and west the Vines on the north side must suffer from being shaded by those on the south side. In all my experience I have found almost no difference of opinion on this point: is it possible that practical gardeners and greenhouse builders have been labouring under a mistake here? *A. D. Mackenzie, 2, Grove Terrace, Edinburgh.*

— At the conclusion of Mr. Adams' paper there is a rule for finding the quantity of 4-inch pipe necessary for heating so many cubic feet of air to any requisite temperature. I venture to state that there is an error in the wording of the rule. We find "Multiply 125 by the difference between the extreme external and internal temperature, and divide their product . . . betwixt the temperature of the building and the pipes, &c." I think that where I have left a dotted space

the words "by the difference" have been omitted; and this statement is supported by the example:— $125 \times 55 = 6875$ ;  $6875 \div 125$  (the difference between temperatures of pipes and hou-e)." *T. H. Larkin, Eastbourne.*

**Clockwork Subservient to the Ripening of Fruits.**—One of the great desiderata in the bringing of fruits to perfection in this country is in ordinary seasons more sunshine, and especially is this the case with regard to those kinds which have been introduced from warmer climate. As we cannot obtain this, however, it behoves us to make the best use of what we do get, and by the method I am about to describe this can be done without the aid of glass very effectually, and at the same time comparatively inexpensively. I will describe it first in its most simple form, but many improvements can be added, some of which I will mention further on. 1. A semicircular receptacle for the soil, in which to plant the tree, large or small, according to the wish of the proprietor or the requirements of the tree; must turn easily on a pivot. 2. At the back of the receptacle must be a wall made of some light material, such as wood or something even lighter—painted canvas would do if stretched on a strong frame—to train the tree to. 3. A clock. This may be a very simple affair—a few cog-wheels, and a sufficiently heavy weight to give the motive power, and a pendulum to regulate the speed. 4. The clock and walled receptacle must be connected, so that the former causes the latter to revolve once in twenty-four hours. It is said of an old gentleman in Norwich, who flourished two or three generations back, and who was not famous for the possession of a large quantity of brains, that having heard a wall facing south was the best to ripen fruits against, at once ordered his builder to put up a south wall all round his garden. Now by the method outlined above the necessity for a south wall is entirely superseded, for by it the trees may be made to face the sun at whatever hour it happens to shine. Of course any number of receptacles with walls may be erected in a row and in any number of rows, all worked by the same clock; only the more the clock has to do the stronger must its works and the heavier its weights be. Among a large quantity of trees grown in this way it is possible some of them would not in a hot summer require the full amount of sunshine, and these could be so arranged as only to be partially presented to its force; or any tree, if necessary, might be turned away from the sun altogether by turning it round towards a cold quarter, and putting the machinery connecting it with the clock temporarily out of gear. Another advantage of this system is that trees can be retarded in their growth in spring till danger of spring frosts is over, by keeping them turned towards a sunless quarter, but at any time, according to the will of the cultivator, they may be subjected to all the sun that shines, and pushed on rapidly. To guard against spring frosts, however, should it be desired to start the trees early, or should these occur at a period when the trees were in a condition to suffer from them, a coping may be placed at the top of the walls, to be let down in the evening, and raised in the morning at any time that may seem good to the cultivator, by an arrangement in the clock somewhat similar to that usually adopted for letting alarms run down at whatever time they may be set to do so. Each walled receptacle may be made, if desired, complete in itself, and worked by its own clock attached to itself, to which the motive-power may be given by a mainspring. The great thing in this system is, that it enables the fruit grower to avoid any waste of sunshine when it is wanted, and to escape it when it is not wanted. In thinking this matter over, one becomes astonished that some such simple arrangement has not been in general use ever since clocks were invented and fruit trees grown on walls. *J. E. Ewing, Norwich, Jan. 26.*

## Foreign Correspondence.

**CAPE TOWN, SOUTH AFRICA: Dec. 31, 1879.**—*The Phylloxera.*—It is only recently that Vine growers at the Cape have awakened to the necessity of adopting precautionary measures with a view to prevent the introduction of the Phylloxera into this colony. For this purpose meetings have been held in some of the principal wine-growing districts, and I have much pleasure in stating that this most important but much neglected subject has received very liberal support. For a full report of the proceedings I beg to refer you to the accompanying copy of *The Cape Times*, which paper, through its repeated warnings, has, in my opinion, been instrumental in preventing the introduction of a pest, which, in all probability, may attain the proportion of a national calamity. *R. Johnson, Botanic Gardens.*

[The paper obligingly sent by our correspondent

contains a lengthy report of a meeting held under the joint auspices of the Wine Growers' Association, the Cape of Good Hope Agricultural Society, and the Farmers' Protection Society, at which the principal speakers were Mr. S. V. Cloete, Mr. Goodliffe, Mr. S. Van Renen, and Mr. R. Hare, who all agreed in the main that if the Phylloxera got into the colony it would be a very dire calamity. We have not room for even a condensed report of the long speeches made, but may add that the meeting decided upon petitioning the Government in the following terms, to issue a commission of enquiry:—

"We, the undersigned, wine growers and others interested in the wine trade of the colony, desire respectfully to lay before you this their earnest petition, on matters which, although primarily affecting their special industry, have a most important bearing on general trade and prosperity.

"The rapid spread of Phylloxera in nearly all wine-growing countries, especially in the South of Europe, fills us with the deepest alarm, lest the plague should by any means be introduced here, where, from the smaller acreage under Vine culture and the concentration of wine farms, the spread of the disease would be even more rapid and more destructive; indeed, we fear that the now important industry of wine growing would in a very few years be totally destroyed, and a large body of people doomed to ruin.

"We fully appreciate the action taken by your Government in calling attention to the Proclamation No. 88, 1876, forbidding the introduction of Vine cuttings: but this has already been flagrantly violated in the case of a keg of Grapes from Europe, exhibited at the Commercial Exchange; it would be in the last degree puerile and frivolous to say these are not Vine cuttings, they were certainly cut or picked from Vines, and manifestly as likely to harbour the insect as merely saplings or branches. Further cases have come to our knowledge of the importations of the various plants together with Vine cuttings: the latter have been destroyed, but the former passed. We feel that this is so momentous a subject, that nothing but the most rigid exclusion of all things which can possibly or probably convey the infection is essentially necessary. We, therefore, pray that the prohibition of imports may extend 'to all plants, cuttings, tubers, roots, or bulbs,' and that all such be seized and instantly thoroughly destroyed; beyond which we would urge that all importers of every kind of goods which could hardly be subject to rigorous search, should be required to make a declaration, under the penalty set forth in the proclamation, that no things as heretofore enumerated are contained in any packages when making the Customs' clearance.

"We are aware that this specification would embrace the Potato, and although the Phylloxera has not, so far as we are informed, been detected in the Potato itself, yet, as in very many places Potatoes are planted between the rows of Vines, the danger of even one or two insects being adherent is imminent, and one case would be fatal.

"We are aware that it has been stated that the disease is already amongst us, but this opinion is rejected by those familiar with its appearance, although there can be no doubt that there are diseases which for some time have affected our vineyards. We, therefore, pray you to issue a Commission thoroughly to investigate these diseases throughout the wine-growing districts, and to submit the results to you for the purpose of being transmitted to England to get further directions and information from European experts.

"We are informed that a case of Vines, said to be affected, has already been prepared for transmission to the Crown Agents, and we trust you will urge these gentlemen to have the specimens carefully scrutinised by the most eminent men in Europe, to ascertain the exact character of the disease, and, if possible, to prescribe a remedy."

Mr. S. Van Renen submitted some Vine roots to Mr. R. Trimen, of the South African Museum, a competent entomologist, but he did not find any trace of the Phylloxera or its eggs. We may also add that the case of Vines alluded to in the last paragraph of the petition has arrived in this country, and we understand that the appearances presented on a first inspection are not consistent with the presence of Phylloxera.]

Forestry.

**THINNING SCOTS FIR PLANTATIONS.**—Mr. W. Baxter Smith, in last week's *Gardeners' Chronicle*, pp. 109, 110, in reply to my previous paper, describes the examples of plantations therein given as partial failures, and infers that there has been mismanagement attending them. I neither take credit nor blame for the success or failure of any of the subjects described. I give the facts as they stand, and allow Mr. Smith and others to draw their own conclusions. Mr. Smith designates the articles in the *Transactions*

of the Scottish Arboricultural Society as "reports," while I would term them essays, on the theories of forestry. Lest, however, I depart from the rule of non-discussion of books or men, I shall leave them as they are. It is a much easier matter to put a splendid plantation upon paper than it is to put it upon land. I have had in different parts of the country about 20,000 acres of woods and plantations directly under my charge, and have also either closely observed or inspected an area of nearly similar extent, and from carefully collected statistics from such a field during a period of over thirty years I hope to fall upon some records showing the high attainable value of Scots Fir plantations of various ages; but I very much fear none will be forthcoming showing the true value so high as Mr. Smith and some others believe attainable on poor moorland at fifty years' growth. Having in my last given a statement of some plantations (1, 2, and 3), I shall, for the sake of reference and identity, continue the same, thus:—

No. 4 is a mixed plantation of Larch and Scots Fir, being a crop succeeding one of Scots Fir. It was planted in 1858, and comprehends 36½ acres. It was thinned for the first time in 1869, and all inferior growths cut down. No money was derived from the thinnings, as the clearing of them out of the plantation was considered sufficient offset against their value, and was done by tenant-farmers in the district. The work of thinning was done by men at day wages, and cost an average of 5s. per acre, which, though a small item, instead of being put to the credit of the plantation, was on the contrary charged against it. On valuing the plantation shortly after being thinned the following were the results:—Larch trees upon the ground, 317 per acre; Scots Fir, 270 per acre; Beech and Birch, equal to 589 trees per acre in all; top-growth, 500 lineal feet per acre, value 20s.; value of the whole plantation, £326 5s.; transferable value, £5 per acre; prospective value at sixty years' growth, £35 per acre. Whins prevailed in some parts, but not seriously, and roadways intersected the plantation for convenience of clearing, &c., and this to some extent reduced the average number of trees per acre, but increased the value of the general crop. On looking at the plantation at this stage of growth it appeared rather thick than otherwise, owing to the trees being well branched, and yet, as is seen, there are fewer than 600 trees per acre upon the ground, while Mr. Smith's paper, which gave rise to the discussion, gives, after the first thinnings were effected, 1550 trees as the crop per acre.

No. 5 is a subject of considerable importance, and presents some features of interest to foresters. It is situated in Morayshire, comprehends 1000 acres, and was planted in 1803-5. I have no record of the formation or planting of it, and only know its early history from hearsay and subsequent appearances. The whole crop, with isolated exceptions of Larch and Birch, consists, or rather consisted, of Scots Pine, and had evidently been planted at the rate of 4000 to 5000 trees per acre, judging from the stools, &c. The plantation fence, which was a turf dyke, was kept in repair till the plantation was about fifteen years old, when it was let down and sheep admitted to graze at pleasure, without, as far as is known, doing any damage. The plantation was never regularly thinned, but here and there a few "cabers" cut as required for fencing, there being no other demand at that time for thinnings in the district.

In 1851, when the plantation was between forty-six and forty-eight years old, a contract for thinning was entered into with a wood merchant, who purchased 138,000 trees, as follows:—

36,000 trees, to stand 4 inches diameter at 12 feet from the ground, at 3/4d. each .. ..	£112 10 0
72,000 trees, to stand 6 inches diameter at 12 feet from the ground, at 1 1/4d. each .. ..	575 0 0
24,000 trees, to stand 8 inches diameter at 12 feet from the ground, at 2 1/4d. each .. ..	250 0 0
6,000 trees, to stand 10 inches diameter at 12 feet from the ground, at 6d. each .. ..	150 0 0
138,000 total number. Total amount ..	£1037 10 0

138,000 trees ÷ 1600 acres = 86 trees average per acre thinned out, or 12s. 11 1/2d. per acre derived from the thinnings.

From 1856 to 1866 thinning was carried on extensively, and about 300 trees per acre (including the first contract) were taken out, which, when added to the remaining crop (250 trees), gives an account of 550 trees per acre out of the 4000 to 5000 originally planted and grown up, but not to profitable or useful size.

The following is the average valuation of the whole

remaining crop at about sixty years old (some portions having by this time been cut and cleared entirely):—

1.8 timber trees, 7 feet cube each = 8.66 feet, at 6d. per foot .. ..	£12 8 0
80 spars, 5 to 8 inches diameter at 12 feet, at 15 1/2d. each .. ..	6 0 0
56 pit props, 3 to 5 inches diameter at 12 feet, at 6d. each .. ..	1 8 0
.. .. .. .. ..	£21 16 0
.. .. .. .. ..	2 0 0
.. .. .. .. ..	£23 16 0
.. .. .. .. ..	2 0 0
.. .. .. .. ..	£25 16 0

The value of the ground as pasturage previous to planting was about 1s. 6d. per acre, and it let at about 1s. per acre as plantation grazing. Had the plantation either been thinned at the proper time or not thinned at all, since at first neglected, but cut and cleared entirely at sixty years' growth, £40 per acre would probably have been derived from it. C. F. Michie, Cullen House, Banffshire, Jan. 26.

Notices of Books.

**The Art of Perfumery, and the Methods of Obtaining the Odours of Plants, &c.** By G. W. Septimus Piesse, Ph.D., F.C.S., &c. London: Longmans, Green & Co., 1879.

This, though a fourth edition of a work published some twenty-four years since, is to a large extent a new book, for a great deal of it is entirely new matter. So much indeed has been added that it now appears in an enlarged form, and extends to 506 pages against 287 pages in the old edition. The space devoted to the history of perfumes—a very interesting section—has been increased nearly five-fold. As an illustration of the importance of perfumes in a commercial point of view, Dr. Piesse says that in consequence of the taste for perfumes and cosmetics being carried to a very high pitch, "immense factories have been established and store-houses built, and London and Paris supply perfumes to all parts of the world. Its annual products exceed in value 50,000,000 fr. (£2,000,000 sterling)."

In the section treating of the sources of perfumes the plants mentioned are arranged alphabetically, according to their popular names. We are compelled to say that this section falls far short of the accuracy that might have been attained. Under the head of Citronella, which is described as an oil procured by distilling the leaves of *Andropogon Nardus*, obtained chiefly from Ceylon, we find the following paragraph:—"This essence must not be confounded with those produced by other plants very different, although bearing the same name. There are, indeed, numerous plants, the odour of which more or less resembles that of citron. Among these may be mentioned the male Southernwood (*artemisia abrotanum*, synantherae); the melissa (*melissa officinalis*, labiate); the Sweet verbena (*verbena tryphilla*); the lipia citriodora, and *alaysia citriodora*." In other places we read *Lychinis* for *Lychnis*, *Convulvulus* for *Convolvulus*, *Melauca* for *Melaleuca*. Morren is also referred to as Marren three times over in close contiguity. There mistakes are the more to be regretted because the information on the cultivation and commerce of the various plants is accurate. Citronella-oil, for instance, which has been before referred to, is stated to be exported from Colombo to the extent of 40,000 lb. annually. The export price at Colombo is 4s. 1d. per pound, and being cheap it is largely used for perfuming soap. "What is now so generally sold as 'honey' soap is fine yellow soap slightly perfumed with this oil." The trade in this one article in Ceylon is estimated at £8000 annually, and at Gaylang, Singapore, about 1000 acres are under Citronella, Lemon-grass, and Patchouly cultivation.

On the subject of Peppermint cultivation, the author tells us that "the finest Peppermint is that cultivated at Mitcham, in Surrey; the sight of the

numerous acres of this plant at that place is alone sufficient to show the public taste for this odour; strictly speaking, however, Peppermint is consumed more through the mouth than the nose. Large as is our own consumption, England exports a considerable amount of the otto of Peppermint, which is readily obtained from it by distillation. . . . The Peppermints find at Mitcham all the conditions they require to arrive at perfection—a temperate climate, a sandy soil, an abundance of moisture. The Croydon drainage works have, however, reduced the last item, and the Mints have suffered accordingly. There are two varieties of Peppermint grown at Mitcham, which are there technically termed 'white' and 'black.' As seen in cultivation these two plants have a totally different appearance; the black has a much stronger habit of growth than the white, the leaves also are darker, and the stems and ribs of the leaves are of a purple instead of a green colour. Though Dr. Piesse refers the white variety to *Mentha piperita*, and says that not only he, "but several good and well-known authorities who have been invited to see the black variety growing can properly define it, it is, we believe, referable to *M. piperita* var. *vulgaris*, while the white form has been called *M. piperita* var. *officinalis*. Commercially there is as much as 10s. per pound difference in the market value of the otto produced from these two forms, the black being inferior." In answer to the question that might arise as to the advisability of cultivating the white to the exclusion of the black, since its otto is the most valuable, the author points out that the black is far more hardy than the white, it bears spring frosts better, longer drought and climatic influence generally. "Again, the black Mint will yield by one-fifth to one-sixth more otto per acre than the white, all conditions being equal."

From what we have said it will be gathered that the book is not only an extension of, but a great improvement on the old edition, notwithstanding the shortcomings we have felt ourselves compelled to draw attention to. The illustrations are much more numerous, and there is a fairly good index—a useful addition that was entirely wanting in the old book.

## Reports of Societies.

**Society of Arts:** Jan. 28.—At a meeting held on Wednesday evening last, in the rooms of this Society, Mr William Paul, of Waltham Cross, read a paper on "The Future of Epping Forest," from which we take the following extracts. The chair was taken by John T. Bedford, Esq., Chairman of the Epping Forest Committee:—

### THE FUTURE OF EPPING FOREST.

The subject I have the privilege of bringing before you this evening is "How shall Epping Forest be dealt with?" It is consigned to the Corporation of the City of London, "for the recreation and enjoyment of the public," the details of arrangement being left largely in the hands of the Conservators, who have accepted a trust of no mean magnitude and importance, the fulfilment of which is sure to be narrowly watched and freely criticised. I must, at the outset, beg of you to consider the remarks I am about to make as suggestive rather than exhaustive—as dealing with the general rather than the particular. No precise or definite rules can be given, as regards the execution of details, which might not be advantageously broken through or ignored under varying circumstances. There is here an unrestricted field for the exercise of taste and genius, and those great qualities of the human mind must not be "cribbed, cabined, or confined" by rules.

Although thoroughly acquainted with every part of the forest, I yet approach the subject with diffidence, so many features of interest and importance, *in esse* and *in posse*, presenting themselves which it would be well to develop, create, embody and maintain. It will, however, clear away a host of difficulties if we keep in view the fact that the Act of Parliament declares that Epping Forest must remain a forest. On this ground, therefore, let us consider the subject from a forestal point of view. But in taking up this position, it must not be inferred that I am about to advocate the view that the forest should remain as it is; on the contrary, while holding that here "the great materials of the scene are provided by Nature herself," I am of opinion that a certain amount of overhauling, sorting, rejection, importation, and rearrangement is necessary. The forest should be studied piece by piece, looked at and dwelt upon with the eye of a painter and the soul of a poet, the whole being kept constantly in view, that the outcome in

the end may be utility, grandeur, picturesqueness, variety, and harmony.

### SCENERY.

The scenery of Epping Forest, as a whole, is hardly of a character that can be correctly spoken of as sublime, or beautiful, although beautiful spots may occasionally be met with, and it possesses the elements of both picturesqueness and grandeur. But there are no mountains or torrents, no frowning precipices, no furious eddies, no flowing cascades. It would, perhaps, be correctly described as a tract of woodland and pasture, the surface broken into hill and dale, interspersed with a few fine trees and groves; the old trees possessing a rare and glorious beauty, but not being numerous or prominent enough to impart dignity to a forest of 6000 acres. It is picturesque from its natural ruggedness; it is grand from its extent. These two forms, or expressions of beauty, picturesqueness and grandeur, which are inherent, should never be lost sight of or suffer diminution at the hands of the improver. The former is capable of a pleasing and almost indefinite expansion—variety, the chief present want, may, from the great extent of the forest, be introduced without compromising its grandeur; the latter may be heightened by opening up more distinct views of the largest trees, the handsomest of these being left standing, as individuals or in groups, by clearing away the brushwood which surrounds them. Extreme caution should, however, be observed in moving from these to other forms or species of beauty, and I should scarcely think it safe to introduce any that are not already visible and pronounced, or for which there are not special natural advantages.

### THE GROUND.

From my knowledge of the ground, I feel little hesitation in submitting the opinion that no improvement adequate to the outlay could be effected by extensive alterations of the surface. Here and there, doubtless, there may be holes to fill in, and ugly knolls to reduce or modify, but the general surface of knoll and glade, of dingle and dell, should, in my opinion, remain undisturbed. The scenery of Epping Forest was that of a quiet English pastoral character, and such it should remain. I would not, therefore, attempt to alter the surface of the ground. Draining, however, is a very important matter, and this should be sedulously attended to. At present it is impossible in winter, or even after rain in summer, to walk any distance without encountering bogs or wet places, and one of the first efforts of active labour should be to lay these wet places in the forest dry. If bogs must be preserved, for the sake of the aquatic or semi-aquatic plants which grow in and around them, they should be few in number, and in positions where they will not interfere with the enjoyment of the public.

### ROADS, RIDES, AVENUES, AND PATHS.

It may seem scarcely necessary to dwell on the importance of wide, dry, solid roads through a track of land, which, from north to south, is some 12 miles in extent. There are, however, some of the most beautiful parts of the forest situated at some distance from the present carriage roads, which it might be well to open to view. Rides (for saddle-horses only) would also be a most useful and enjoyable feature in any scheme, and could be worked out at no great expense. Whether of grass or sand, they should be sheltered and shady, and these conditions may be secured by the formation of vistas and avenues. I should recommend the introduction of avenues—sparingly, it is true, and they must have a reason for their existence, a purpose to serve, or there must be objects to be reached through them. Avenues afford a fine opportunity for the introduction of rides, but they should not be in too prominent a position, and should be upheld or supported by being placed in immediate contact with large breadths of forest woodland. Walks or paths innumerable already exist, many of them, probably, rights of way; others, which are but little used, seem to be merely short-cuts from point to point. These are, for the most part, in a state which admits of great improvement, by clearing, mending, and draining. Not that I would advocate the clipping and levelling met with in garden hedges and walks, but there should be no hindrance to the free passage of pedestrians; this accomplished, the more intricate, the wilder, and more varied the surroundings, the greater the enjoyment. Although recommending the opening of parts of the forest by roads, &c., a jealous watchfulness should be exercised over their multiplication; there should be good and strong reasons for every new road, ride, or path, as a needless or useless repetition of these would deform or impair the grandeur of the forest.

### TURF.

Green, soft, springy turf is so agreeable to the eye, and so pleasant to the feet in summer, that it is well worth the utmost consideration. To have it here in a perfect state throughout the whole year

need not be a tedious or costly matter, for it might be had beautiful to the eye in a single summer by sowing properly selected seeds in the spring, and it would become closer and more solid year by year. There are already many such green spots, which require little more than drainage to make them enjoyable, and they should be increased in number in suitable positions as opportunities occur.

### WATER.

The life and importance which water gives to forest scenery is so great that it ought to abound everywhere. There are springs, and ponds, and brooks in the forest, and I should suppose that by the aid of reservoirs much might be accomplished in this way without any extravagant outlay. It would be a great achievement if only some of the valleys and hollows could be filled with water. A river or running stream, with cascades, fountains, and waterfalls, may be impracticable; but surely lakes, or other natural devices as regards the management of water, might be wrought out satisfactorily, and such, with water-plants and water-fowl, are always a telling feature in rural scenery.

Whatever may be the forms of the lakes, they should be natural, irregular in outline, and of considerable size, however few in number, to be in accord with the character and extent of the ground with which they are associated.

### CLEARING AND PLANTING.

I am of opinion that, while we do not want to change the forest into a landscape garden, or a garden of any kind, we yet want the experience and skill of the landscape gardener to clear away the superabundant rubbish now painfully prominent, while scrupulously preserving every visible or hidden rudiment or germ of beauty in which his practised eye and mind may discern a capacity of extension and development. I would, in the first instance, preserve every tree or shrub that is worth preserving, merely clearing away what is unmeaning, unsightly, or ill-placed, reducing confusion to order without destroying variety or intricacy, in doing which there is room for the exercise of the most correct taste and the most mature judgment. This much accomplished, the horticulturist should step in, to make the most of the existing trees, and to add such, native and exotic, as may seem desirable. Many of the former are present but poorly developed, and others have been injured, beyond recovery, by reckless lopping. With regard to the pollard trees—the result of lopping—they are, I think, for the most part, formal and uninteresting. But judicious pruning and thinning would, in a few years, add many feet to the stature of the unpruned trees, and do much to convert the present vast tract of monotonous wood and waste into veritable and beautiful forest.

We now come to a very important part of the work in hand—planting—with regard to which there is likely to be a great diversity of opinion. The ground I take up is, that trees—wood and lawn—single trees, groups of trees, groves, avenues, thickets, interspersed and relieved with open glades and wide stretches of pasture, are to be grand distinguishing features of Epping Forest in the future. Epping Forest differs from most English forests, inasmuch as its soil is generally highly favourable to the growth of trees. There is, in fact, every description of soil—sand, gravel, peat, loam (light, medium, and heavy), and clay—so that the requirements of almost every tree and shrub may be met and satisfied. A certain amount of planting is doubtless necessary, and it is highly important here that the right trees should be put in the right places, and in the right soil. They should not be planted in formal clumps or groups, but thrown together, in suitable positions, in large irregular masses, the outlines, so to speak, being broken into bays and promontories.

### WHAT SHALL WE PLANT?

But, if we clear away, we must in some instances replace—the forest must be clothed—and with what shall we replace? The answer to this question is—Any or all the British forest trees, and such exotic trees only as are known to endure the rigours of an English climate. Another very important point to work out in the process of planting is variety. The colours of the trees now existing in the forest are, for the most part, of a uniform green; and, however correct it may be to use such as the groundwork of our operations, it is desirable to secure every shade of colour, from grass-green and silvery-grey to inky black, as well as the varied tints of the unfolding leaves in spring and the glow of the autumnal foliage in autumn. By this means the forest would present an entirely different aspect at each season of the year—spring, summer, autumn, and winter; and no mean end would be accomplished if, in planting, the pleasing natural characteristics of each section could be brought out in all the fulness of their individuality and beauty. It is desirable that we should have here more variety in the young leaves in spring; greater exuberance of foliage, securing coolness and shade in summer; a richer glow of red, yellow, and russet-brown in autumn; and the shelter and furnished appearance of evergreens in winter. The introduction of trees remarkable for the colours of their leaves in spring and autumn brings out a new feature, which may be said to stand midway between the permanent and incidental beauties of forest scenery. It differs from the permanent, inasmuch as the colours are striking for a short period only, and the leaves fall in winter; it differs from the incidental, because, unlike clouds, storms, mists, sunshine, and shadow, it recurs

regularly at fixed intervals. Now, I would not ignore the fact that, in introducing trees with strongly-coloured leaves—as is also the case with flowering trees—there is a danger of producing, by strong contrast, what landscape gardeners call "spottiness." But this is not a necessary consequence of their use; variety is not incompatible with harmony; and their union may be secured under the direction of any one possessing taste and judgment. It may be further remarked that, in attending to the colours of the leaves at various seasons, we by no means exhaust the resources at our disposal to break the monotony which undoubtedly exists at present in many parts of Epping Forest. With the exception of a few Hollies, most of the trees and shrubs there are what we call "deciduous," that is, they lose their leaves on the approach of winter. And even the varying forms of leaves afford still further opportunities, if it be thought desirable—as it may in some few instances—to work out any nicely elaborated pictures of tree scenery. It is unfortunate that nearly all the trees in Epping Forest have small leaves, with outlines but slightly diversified.

Under the head of planting it would seem well to consider that the pic-nic or gipsy party is a favourite outing with the English people, and ample provision should be made for the customary spread in a forest devoted to their recreation and enjoyment. This I would propose to accomplish by planting a series of groves, in suitable spots, keeping the stems of the trees clear of branches 8 feet or more from the ground, thus combining opportunity for freedom of movement with perfect shade. Beech groves and Oak groves might be formed from trees already existing, and there might be added Chestnut groves, Birch groves, Lime groves, Cypress groves, Cedar groves, Wellingtonia groves, and others, almost without limit. These trees should be planted in masses, and in such manner that they also vary and improve the character of the forest scenery.

TREES AND SHRUBS.

I shall now offer a brief list of trees and shrubs which stand foremost, in my opinion, as likely to contribute most to the improvement of the existing landscape:—

*Deciduous Trees Remarkable for the Beauty of their Unfolding Leaves in Spring.*—Purple Beech, foliage purple; Purple Birch, foliage purple; Purple Horse Chestnut, foliage purple; Corstorphine Plane, leaves yellow; Colchian Maple, leaves red; Larch, leaves light fresh green; Pyrus Aria, White Beam (in varieties), leaves white.

*Deciduous Trees for Summer Leaves.*—Birch, Plane, Poplars of sorts, Lime, Horse Chestnut, Spanish Chestnut, Gleditschia triacanthos, Mountain Ash, Turkey Oak, Magnolia of sorts, deciduous Cypress, Acacia, Ailanthus glandulosus, Sycamore.

*Deciduous Trees Remarkable for the Beauty of the Decaying Leaves in Autumn.*—Scarlet Oak, Liquidambar, leaves red, purple, and yellow; Norway Maple, leaves yellow; Scarlet Maple, leaves red; Tulip-tree, leaves yellow; Parrotia persica, finely-coloured leaves; Stag-horn Sumach, leaves red and yellow; Black Walnut, leaves yellow; Kolreuteria paniculata, leaves yellow; Ginkgo Tree (Salsburia), leaves yellow.

*Evergreen Trees, for Shelter and Effect in Winter.*—Araucaria imbricata, Deodar, on hills or slopes; Mount Atlas Cedar, Cedar of Lebanon, Douglas Fir, Spruce Fir, Austrian Pine, Corsican Pine, Pyrenean Pine, Scotch Pine, Lawson Cypress, Lambert Cypress, Wellingtonia gigantea, Arbutus, Evergreen Oak, Holly, Black Spruce, Piceas, various; Hemlock Spruce, Pinus insignis, less hardy than others, but desirable for its colour—should be planted on hills and slopes; Pinus excelsa, Sequoia sempervirens, Cryptomeria japonica, Thujaopsis borealis, Thuja Lobbia, Chinese Juniper, Red Cedar.

*Flowering Trees.*—Crab and its varieties, Cherry of various sorts, Hawthorn and its varieties, double Sloe, flowers purple; Almond, Plum of various kinds.

It may be said that this is a rather limited list of trees, and I admit that it is so. But then it must be remembered that we are looking at the question from the forest scenery rather than from the scientific or gardenesque point of view, and for the realisation of our object we prefer to plant a few really effective trees on a large scale to the introduction of a multiplicity of non-effective species and varieties.

SHRUBS AND PLANTS.

Of shrubs of moderate and lowly growth, the Rhododendron (*R. ponticum*) should specially abound. There are many spots in which it would thrive as well as in its native habitats, and the richness of its foliage in winter, and the gorgeousness of its blossoms in May and June, commend it to every observer. The Azalea pontica is also a fine-flowering shrub; Garrya elliptica, too, which is evergreen, producing catkins like the Hazel in winter; the Leycesteria formosa, and the Mahonia Aquifolium are all desirable shrubs. The Hazel is also desirable on account of the catkins and nuts it produces, and the Scarlet and Golden Willows, and the red-barked Dog-wood for the colours of their bark in winter. The Furze should be sown largely in dry, stony places; the splendour of its golden blossoms in early summer is well known, and its rich strong scent is generally agreeable. The Broom is also a beautiful plant. However desirable it may be to preserve the species of British plants growing at present in the forest, it is probable that some will be unintentionally diminished in number or, perhaps, destroyed by the work of draining and other improvements. It might, however, be possible to have stations at which the rarer kinds—as the Sundews (*Droseras*)—could be preserved, and the natural flora might be largely increased by sowing seeds of others broadcast over large tracts of prepared ground in spring. Primroses and Bluebells exist already in great abund-

ance, and there are perhaps no prettier wild flowers than these in spring; but there are many others of rare interest which are absent, or are met with only occasionally. Such might be introduced, or increased in number, at a small cost, and, under this head, odoriferous flowers should be largely cultivated. Thus the unavoidable diminution on the one hand might be compensated for by an increase on the other, and no wild flowers, however insignificant in appearance, should be heedlessly destroyed. I would here put in a special word in favour of the Bramble (*Rubus fruticosus*); this should be encouraged on all sides, for this plant is beautiful when in flower, and attractive when in fruit. The Pampas-grass (*Gynerium argenteum*) should prove a suitable and effective plant, and wild Roses, wild Honeysuckles, wild Clematis, the Hop, Ivy, Virginian Creeper, St. John's Wort, Lily of the Valley, Penwinkles, and Violets should specially abound. Heath and Fern are already plentiful, and both are valuable—the former for its beautiful flowers, the latter for its leaves and autumn tint.

ANIMALS AND BIRDS.

We have hitherto been dealing with inanimate Nature, the still scene of pastoral beauty. But we must not stop here. We want the variety and excitement of life and motion. In addition to the cattle, which will presumably continue to pasture here, deer and other harmless *feræ naturæ* should abound in a forest of this size, and should be increased, or even imported, while noxious reptiles, like the adder, should, if possible, be extirpated. Birds should be encouraged, by strictly preserving those that are indigenous to the forest, and bringing others from various parts of England, keeping up a stock of the plants on which they feed, by planting or sowing fresh seeds in spring. It will hardly be questioned that a herd of deer crossing one's path in a forest ramble is a pleasant *rencontre*, while the flitting and song of birds is a constant source of interest and delight.

RECREATION GROUNDS.

It may seem an anomaly to speak of enclosed recreation grounds in an unenclosed forest, but I presume that special recreation grounds must exist, and, if so, that they must be enclosed for the convenience and comfort of the public. There should be open spaces for cricket and other English games. There should also be water of uniform and safe depth here for bathing, boating, fishing, and skating. In these grounds there would be a fair opportunity, should it be deemed expedient, for more elaborate ornamentation, by the introduction of various trees and shrubs which might not be in correct taste in the open forest as we have freshawed it, or which could not safely be trusted there. But I would not go further in this direction than the planting of trees and shrubs; I do not want a flower garden even here; the ornamentation, if more elaborate, should be but slightly so.

LODGES.

It would be too much to expect that every entrance to the forest should be adorned with a lodge, or lodges; but some, at least, of the entrances would seem to be proper and convenient places for them. A forest of between 5000 and 6000 acres will require a staff of men to perform the multilicious duties attendant on its preservation, and to maintain order. For comfort and economy, their dwellings should be near their work, and this would, in many cases, require them to be in the forest. These lodges and their surroundings should, I think, vary in design, that the one may not be mistaken for the other, but the whole might be of one style of architecture, and I should give the preference to the Gothic. In their construction, ostentation or parade should be scrupulously avoided.

In conclusion, permit me to remark that, while dwelling on this subject, I have been deeply impressed with the fact that never before in the history of England has such an opportunity been afforded of making a grand national recreation ground. Ostensibly for the use of the inhabitants of London, it may become in the future, and that without any vast expenditure of money, "a thing of beauty," which shall be a joy to every Englishman, and one of the bright spots of our island which shall be sought out by visitors from the most distant shores.

The meeting was subsequently addressed by Sir Fowell Buxton, Mr. Alfred Russell Wallace, Dr. Murie, Mr. English, and the Chairman, who stated that while every point touched upon in Mr. Paul's paper would be carefully considered by the Epping Forest Committee, it was the intention of that committee, as far as possible, to keep the forest as it is.

The Weather.

LONDON: *Barometer.*—During the week ending Saturday, January 24, in the vicinity of London the reading of the barometer at the level of the sea decreased from 30.01 inches at the beginning of the week to 30 inches by the morning of the 18th; increased to 30.65 inches by the morning of the 21st, decreased to 30.33 inches by the afternoon of the 22d, increased to 30.50 inches by the evening of the 23d, and decreased to 30.33 inches by the end of the week. The mean reading for the week at sea level was 30.43 inches, being 0.10 inch above that of the preceding week, and 0.51 inch above the average.

*Temperature.*—The highest temperatures of the air observed by day varied from 37° on the 22d to 27° on the 20th; the mean value for the week was

34°. The lowest temperatures of the air observed by night varied from 17° on the 20th, and 18° on the 21st, to 30° on the 23d; the mean value for the week was 23°. The mean daily range of temperature in the week was 10°; the greatest range in the day was 14°, on the 21st, and the least 5°, on the 24th.

The mean daily temperatures of the air and the departures from their respective averages were as follows:—Jan. 18, 30°.6, — 6°.3; 19th, 26°.4, — 10°.6; 20th, 22°.8, — 14°.4; 21st, 26°.2, — 11°.1; 22d, 30°.8, — 6°.6; 23d, 34°, — 3°.5; 24th, 32°.5, — 5°.2. The mean temperature of the air for the week was 29°, being 8°.2 below the average of observations extending over a period of sixty years.

The highest readings of a thermometer with blackened bulb in vacuo, placed in the sun's rays, were 96° on the 19th, 58° on the 18th, and 57° on the 22d; on the other days of the week the readings did not rise above 40°. The lowest readings of a thermometer on grass, with its bulb exposed to the sky, were 15° on the 19th and 20th, and 16° on the 21st. The mean of the seven lowest readings was 21°.

*Wind.*—The direction of the wind was variable, and its strength almost calm, except on the 19th and 22d, when it was moderately strong.

The weather during the week was generally dull, and the sky cloudy, except on the 19th, when it was very fine and bright. The air was very dry and cold, especially on the 19th, 20th, and 21st. Fog and hoar-frost were prevalent.

A few flakes of snow fell at about 1 P.M. on the 22d.

ENGLAND: *Temperature.*—During the week ending Saturday, January 24, the highest temperatures of the air observed by day were above 42° at Plymouth, Truro, Leeds, and Sunderland, and below 37° at Blackheath (London), Bristol, and Wolverhampton; the mean value from all stations was 40°. The lowest temperatures of the air observed by night were below 18° at Blackheath, Bristol, Cambridge, Wolverhampton, and Nottingham, and above 28° at Plymouth and Sunderland; the general mean from all places was 24°. The extreme range of temperature in the week was above 23° at both Cambridge and Nottingham, and below 15° at both Plymouth and Sunderland; the mean range of temperature from all stations was 19°.

The mean of the seven high day temperatures was above 38° at Truro, Plymouth, and Sunderland, and below 35° at Blackheath, Bristol, and Wolverhampton; the mean value from all places was 36°. The mean of the seven low night temperatures was below 26° at Blackheath, Brighton, Bristol, Cambridge, Wolverhampton, and Nottingham, and above 30° at Truro, Plymouth, and Sunderland; the mean from all stations was 27°. The mean daily range of temperature in the week was above 11° at Bristol, Cambridge, and Nottingham, and below 8° at Plymouth, Norwich, Liverpool, Leeds, and Sunderland; the mean daily range from all places was 9°.

The mean temperature of the air for the week from all stations was 31°, being 1½ higher than the value for the corresponding week in 1879. The mean temperature was above 34° at Truro, Plymouth, and Sunderland, and below 30° at Blackheath, Bristol, Wolverhampton, and Nottingham.

*Rain or Snow.*—A little rain or snow fell at some places. The amounts varied from 0.09 inch at Plymouth and Sunderland to 0.01 inch at Liverpool. At Truro, Brighton, Blackheath, Bristol, Norwich, Wolverhampton, and Sheffield no rain or snow was recorded; the average fall over the country was 0.03 inch.

The weather during the week was dull, very cold, and dry, though fine at times.

A little snow fell at some places. On the 20th and 21st the minimum temperatures were generally very low.

SCOTLAND: *Temperature.*—During the week ending Saturday, January 24, the highest temperatures of the air observed by day varied from 44° at Paisley, to 39° at Edinburgh; the mean value from all stations was 41°. The lowest temperatures of the air observed by night varied from 19° at Perth to 26½° at Glasgow; the mean from all places was 23½°. The mean range of temperature in the week from all places was 17½°.

The mean temperature of the air for the week from all stations was 32½°, being 3¼ higher than the value for the corresponding week in 1879. The mean temperature was the highest at Aberdeen, 35°, and the lowest at Perth, 30°.

*Rain.*—The amount of rain or melted snow measured at Aberdeen was 0.12 inch, at Glasgow was 0.03 inch, and at Paisley was 0.02 inch. At Edinburgh, Dundee, Greenock, Leith, and Perth no rain or snow was recorded; the average fall over the country was 0.02 inch.

DUBLIN.—The highest temperature of the air was 41°, the lowest 13°, the extreme range 28°, the mean 30°; and the amount of rain or melted snow was 0.06 inch.

STATE OF THE WEATHER AT BLACKHEATH, LONDON, FOR THE WEEK ENDING WEDNESDAY, JANUARY 28, 1880.

Table with columns: MONTH AND DAY, BAROMETER, TEMPERATURE OF THE AIR (Mean, Highest, Lowest, Range, Mean for Day, Departure from Average), Hygrometric Deductions (Dew Point, Degree of Humidity, Sat. = 100), WIND (Average Direction), RAINFALL. Rows for Jan 22-28 and a Mean row.

Jan. 22.—Fine at times, but generally dull and cloudy. Few flakes of snow at 0.30 p.m.; a little sleet occasionally in the evening.
23.—A dull, overcast day. A cold thaw.
24.—A very dull cloudy day. Cold and dry.
25.—A very fine day. Bright. Very cold and cloudless at night. The minimum temperature, 23°.3, occurred at midnight.
26.—Brilliantly fine and clear. Bitterly cold. Hoar frost.
27.—Dull, cold, and foggy in morning. Much hoar frost. Fine and clear till evening. Fog at night. Bitterly cold.
28.—A dull, gloomy, foggy day. Little sunshine in morning. Very dark and dense fog in evening. Painfully cold all day. The coldest day since December 24, 1878, except Tuesday, January 20, 1880, when the mean temperature was the same as that of this day, viz., 22°.8.

JAMES GLAISHER, F.R.S.

Enquiries.

He that questioneth much shall learn much.—BACON.

WATERLOO PLUM.—We have lately had some enquiries for this variety, which we cannot find in Dr. Hogg's Manual, or any Trade Lists. Is it a local name for an old kind? Geo. Bunyard, Nursery, Maidstone.

Answers to Correspondents.

COMPASS PLANT: T. Williams. The Compass-plant, Silphium laciniatum, is a hardy (North American) herbaceous plant. Any ordinary garden soil will suit it.

FUNGUS ON PALM: T. J. D., Sydenham. The name of the fungus infesting your Palm is Graphiola phoenicis. We are unable to suggest a cure.

GRASS: Poa. Poa annua is the name of the commonest Grass grown, which you can easily identify by looking at the base of the leaf, which is always crumpled.

HOLLY BRANCH: J. H. Please send another specimen.

IMPERIAL FERTILISER: W. W. C. In all cases of its use that we have any knowledge of, the result has been satisfactory.

IVY: J. W. Natural grafting is such a common occurrence in the Ivy that an illustration of any particular instance does not appear necessary. However, if you could send us a photograph of the specimen shown you, we will consider the matter on its merits.

NAMES OF PLANTS: F. Silvester. Lælia anceps.—J. H. B. Oncidium Sanderianum.—Inquirer, Haydock. Your Orchid arrived in too bad a state for identification. Send another specimen.—A. W., Esher. The flower is an Echites, but we cannot name the species without better material.—W. A. B. Both are the common Enonymus japonicus.—W. K. Six specimens at one time is our limit—as we have to repeat week after week. You send us twelve, as though we had nothing else to do! 1, Acalypha limbata; 2, Philodendron daguense; 3, Echites? 4, not found; 5, Adiantum setulosum; 6, Lomaria L'Herminieri. The others next week.—P. E. Zygophyllum simplex.—K. Chrysanthemum segetum.—J. P. Daphne pontica.—D. C. P. Eucalyptus coccifera, certainly.

PEACH TREES CASTING THEIR BLOSSOM-BUDS: Foreman. The most common cause is an insufficient supply of water to the inside borders during the time the trees are at rest. It also frequently occurs where, owing to want of light and warmth through the preceding autumn, the wood has been imperfectly ripened. In this particular case the pale green colour of the underside of the young wood leads to the inference that it is unripe. The past season having been unprecedentedly cold and sunless, and the winter unusually dry, it is possible that the trees in question may have suffered from the two causes combined.

Examine your inside and outside borders, and if you can satisfy yourself that they have not been dry since the leaves fell, rest assured that last year's wood is what it appears to be—badly ripened. The buds left on the trees will open, and most likely set well, if carefully impregnated. Do you thin out all unnecessary wood as soon as the crop is gathered? Never was this advice, so repeatedly given in the Calendar, of more importance than during the two past ungenial years. W. C.

ROSE-TRADER: W., Brentwood. So far as we know, the Rose-grower you enquire about is still in existence; but in all probability "frozen out" of his nursery. Write to him again, enclosing a stamped envelope or post-card for a reply.

Correspondents are specially requested to address, post-paid, all communications intended for publication to the "Editors," and not to any member of the staff personally. The Editors would also be obliged by such communications being sent as early in the week as possible. Correspondents sending newspapers should be careful to mark the paragraphs they wish the Editors to see. Letters relating to ADVERTISEMENTS, or to the supply of the Paper, should be addressed to the Publisher, and not to the Editors.

CATALOGUES RECEIVED:—W. Thompson (Tavern Street, Ipswich), Supplement to Descriptive Catalogue of Seeds.—Messrs. Cranston & Co. (Broad Street, Hereford), Spring Catalogue of Vegetable and Flower Seeds.—Messrs. Hooper & Co. (Centre Avenue, Covent Garden, London, W.C.), Illustrated Descriptive Spring Catalogue.—Messrs. Dick Radcliffe & Co. (129, High Holborn, W.C.), Catalogue of Kitchen Garden and Flower Seeds.—V. Lemoine (Rue de l'Etang, Nancy), List of New Plants.—Mr. W. Bull (King's Road, Chelsea, London, S.W.), Catalogue of Seeds, Lilies, Gladioli, &c.—George Farnsworth (Matlock Nurseries, Derby), Catalogue of Forest and Ornamental Trees and Shrubs.—Messrs. W. H. Quick & Co. (Barnstaple), Select List of Farm, Garden, and Flower Seeds.—Messrs. E. G. Henderson & Son (Pine-apple Nursery, Maida Vale, London, W.), Illustrated Descriptive Catalogue of Flower, Vegetable, and Agricultural Seeds.—R. H. Vertegans (134, Market Hall, Birmingham), Seed List for 1880.—Messrs. W. and W. T. Samson & Co. (8, Portland Street, Kilmarnock), Catalogue of Seeds and Plants.—Messrs. S. Dixon & Co. Markets.

COVENT GARDEN, January 29.

We are quite at a standstill owing to the sharp weather, and fancy prices are again being made of all kinds of vegetables. James Webber, Wholesale Apple Market.

Table of Fruit prices: Apples, 1/2-sieve, 2-0-6; American, 18-0-30; Cob Nuts, 1-0-1; Grapes, 1-6-6; Muscat, 3-6-8; Lemons, 100-3-10; Oranges, 100-6-12; Pears, 100-3-6; Pine-apples, 100-2-3.

Table of Vegetables prices: Artichokes, 6-7-0; Asparagus, 1-0-1; Beet, 1-0-2; Brussels Sprouts, 6-6-1; Cabbages, 1-0-2; Carrots, 0-8-1; Cauliflowers, 2-0-5; Celery, 1-6-4; Chilis, 3-0-1; Cucumbers, 1-6-5; Endive, 4-6-1; Garlic, 0-6-1; Herbs, 0-2-4; Horse Radish, 4-0-1; Lettuces, 1-6-1; Mint, 2-0-1; Onions, 8-0-1; Parsley, 0-6-1; Peas, 1-0-1; Potatoes (new), 3-0-9; Rhubarb (Leeds), 0-9-1; Seakale, 3-0-1; Shallots, 0-6-1; Spinach, 5-0-15; Tomatos, 3-0-1; Turnips, 0-6-1.

Potatoes:—Regents, 100s. to 140s.; Flukes, 120s. to 150s.; and Champions, 130s. to 150s. per ton. German produce is making from 4s. to 7s. per bag. The supply is stopped now in consequence of the frost.

Table of Plants in Pots prices: Arum Lilies, 12-0-24; Azaleas, 30-0-60; Begonias, 6-0-18; Bouvardias, 12-0-24; Cinerarias, 12-0-18; Cyclamen, 12-0-30; Cyperus, 6-0-12; Diacena terminalis, 30-0-60; Erica gracilis, 18-0-24; Erica, 9-0-18; Euonymus, 6-0-18; Ferns, 4-0-18; Ficus elastica, 2-6-15; Foliage plants, various, 2-0-10; Fuchsias, 12-0-18; Hyacinths, 9-0-18; Myrtles, 6-0-12; Palms in variety, 2-6-21; Pelargoniums, scarlet zonal, 9-0-18; Poinsettia, 12-0-24; Primula, single, 6-0-12; Solanum, per dozen, 9-0-24; Tulips, 12 pots, 8-0-12.

Table of Cut Flowers prices: Abutilon, 12 blooms, 6-1-0; Arum Lilies, per dozen, 9-0-18; Azalea, 12 sprays, 1-0-3; Bouvardias, per bunch, 1-0-4; Camellias, per doz., 3-0-12; Carnations, per dozen, 1-0-3; Chrysanthem., large flowers, 3-0-9; Cyclamen, 12 blms., 0-4-1; Euphyllium, 12 blms., 0-9-2; Eucharis, per doz., 6-12-0; Euphorbia, 12 sprays, 3-0-6; Gardenias, 12 blms., 12-0-24; Heliotropes, 12 spks., 6-12-0; Hyacinths, 12 spks., 3-0-6; Roman, 12 spks, 2-0-4; Lily of Val., 12 spr., 1-0-4; Mignonette, 12 bun., 6-0-9; Narcissus, Paper-white, 12 spikes, 2-6-0; Pelargoniums, 12 spr., 1-6-3; Poinsettia, 12 blms., 3-0-9; Primula, double, per bunch, 1-6-3; single, per bunch, 0-9-1; Roses (indoor), doz., 4-0-12; Roses, Fr., doz., 2-6-0; Spiraea, 12 sprays, 3-0-6; Tropaeolum, 12 bun., 1-0-3; Tuberoses, per dozen, 4-0-6; Tulips, 12 blooms, 1-0-3; Violets, Fr., per bun., 5-0-7; White Lilac, Fr., per bundle, 8-0-12.

SEEDS.

LONDON: Jan. 28.—A very quiet feeling continues to characterise the trade for farm seeds. As regards red Clover choice samples keep firm, but secondary qualities are easier. Rather more attention has lately been given to white Clover. In neither Alsike nor Trefoil is there just now much doing. Italian Rye-grass is steady, Mustard and Rape seed are without quotable variation. For Tares there is a brisk demand, and the tendency of prices is adverse to the buyer. Owing to some heavy arrivals, the Canary market is very flat. For blue Peas the trade shows signs of improvement. Haricots and Lentils are in slow request. John Shaw & Sons, Seed Merchants, 37, Mark Lane, London, E.C.

CORN.

Trade was dull at Mark Lane on Monday, but the severity of the weather helped to keep up prices. As regards Wheat the demand was especially quiet, and holders were rather more anxious to sell. No reduction was quoted; but both English and foreign Wheat was cheaper to sell. Barley was slow of sale, but prices were steadier in respect to grinding sorts. Malt was quiet and unaltered. Oats were in better request, and prices were 3d. to 6d. per quarter higher on the week. Beans and Peas moved off quietly on former terms. Flour was in good request, and quotations ruled in buyers' favour. On Wednesday trade was particularly quiet, and for Wheat the tendency was distinctly unfavourable to the seller. Barley was slow of sale, but prices were upheld. Malt was quiet and unaltered. Oats were steady, sound corn moving off on former terms. Maize was dull, as also were Beans, Peas, and flour.—Average prices of corn for the week ending Jan. 24.—Wheat, 45s. 7d.; Barley, 37s. 3d.; Oats, 20s. 1d. For the corresponding period last year:—Wheat, 39s. 1d.; Barley 37s. 5d.; Oats, 20s. 1d.

CATTLE.

At the Metropolitan Market on Monday trade in beasts was very slow, and on the average prices were lower, although choicest qualities were not much cheaper. There were not quite so many sheep as last market, yet more than sufficient for the demand. A large proportion are still of inferior quality; choicest met with purchasers, but at low rates, and many lots of inferior descriptions remained unsold. Good calves were in demand at rather higher rates. Quotations:—Beasts, 4s. 2d. to 4s. 10d., and 5s. 4d. to 6s.; calves, 5s. to 6s. 4d.; sheep, 4s. 8d. to 5s. 4d., and 5s. 8d. to 6s. 6d.; pigs, 4s. 8d. to 4s. 6d.—Trade on Thursday was very dull. Supplies were not large, but amply sufficient for the demand. Both beasts and sheep met a dragging sale, and could only be disposed of on lower terms. Calves also were dull and weak.

HAY.

At the Whitechapel Market on Tuesday trade was quiet, and prices without material change. Prime Clover, 100s. to 128s.; inferior, 70s. to 95s.; prime meadow hay, 80s. to 95s.; inferior, 30s. to 70s.; and straw, 31s. to 37s. per load.—At Thursday's market a large supply of fodder was on sale. The trade remained very dull, and prices were as follows:—Prime Clover, 100s. to 126s.; inferior, 70s. to 95s.; prime meadow hay, 80s. to 95s.; inferior, 30s. to 70s.; and straw, 30s. to 37s. per load.—Cumberland Market quotations:—Superior meadow hay, 92s. to 100s.; inferior, 40s. to 72s.; superior Clover, 110s. to 126s.; inferior, 80s. to 95s.; and straw, 34s. to 40s. per load of 36 trusses.

POTATOS.

The Borough and Spitalfields Markets reports state that the demand continues fair, and prices for all sound descriptions are firm. Scotch Regents, 140s. to 160s.; do. Champions, 140s. to 150s.; Lincoln Regents, 140s. to 150s.; Victorias, 160s. to 190s. per ton; German reds, 6s. to 7s. 6d.; Belgian kidneys, 6s. to 6s. 8d.; French whites, 4s. 9d. to 5s. per bag.—The imports into London last week comprised 26,734 bags from Hamburg, 800 from Bremen, 205 Danzig, 618 Ghent, and 2260 barrels and 7272 bushels from Cornwallis, Nova Scotia.

COALS.

The following are the prices current at market during the week:—Beckside West Hartley, 14s. 6d.; Walls End—Hetton, 16s.; Hetton Lyons, 15s.; Hawthorns, 15s. and 15s. 3d.; Lambton, 16s.; Original Hartlepool, 16s. 6d.; Wear, 15s.; Chilton Tees, 15s. 3d. and 15s. 6d.; South Hartlepool, 15s. 6d.; Tees, 15s. 6d.; South Hetton, 16s.; Tunstall, 15s.

The Manufacturers of this valuable Manure have thought it best, up to the present time, not to publish any Testimonials, knowing well that the greater number that have been published are, if not quite untrue, certainly greatly exaggerated. They think, however, the opinion of a gentleman with such a reputation and large experience as Mr. F. A. Barron, will be considered especially valuable:—

“Royal Horticultural Society’s Gardens, Chiswick.

“Jan. 21, 1880.

“Gentlemen—I am using your Fertiliser, and think very highly of it.

“F. A. BARRON.

“Messrs. Clay & Levesley.”

A List of One Hundred of the most eminent Nurserymen, Florists and Gardeners, who have permitted us to state that they are using this Manure with the most successful results, will be forwarded on application.

Sold in Packets 1s. each, and in Bags,

½ Cwt.	½ Cwt.	1 Cwt.
7s. 6d.	12s. 6d.	20s.

Manufactured by

**CLAY & LEVESLEY,**  
174, HIGH STREET, HOMERTON, E.

**TOBACCO PAPER, CLOTH and CORD,** of excellent quality, and at very moderate rates. Manufactured entirely from Roll Tobacco. RICHARDSON AND CO., Leith, N.B. Trial orders respectfully solicited.

**GAWITH'S FIREFLY CIGARETTE,** for destroying Thrip, Greenfly, and other greenhouse Pests. The advantages of fumigation over all other methods of destroying these enemies must be apparent to all horticulturists. However skilfully applied, insect-destroying powders cannot reach every one, whereas by rendering the atmosphere of a house destructive, all are reached. These Cigarettes are clean and effective; one trial is enough to convince the most sceptical that a long-looked-for handy and clean destroyer has at last been found. The Cigarette merely requires suspending by the wire attached, lighting at each end as in ordinary fireworks, and does its own work without further attention.

Price 1s. 6d. each. To be had from Seedsmen, and from JOHN E. GAWITH, Sole Manufacturer, Lowther Street Tobacco Manufactory, Kendal.

**GISHURST COMPOUND.**—Used by many of the leading Gardeners since 1859, against Red Spider, Mildew, Thrips, Greenfly, and other Blight, in solutions of from 1 to 2 ounces to the gallon of soft water, and of from 4 to 16 ounces as a winter dressing for Vines and Fruit Trees. Has outlived many preparations intended to supersede it. Sold Retail by Seedsmen in Boxes, 1s., 3s., and 6s. Wholesale by PRICE'S PATENT CANDLE COMPANY (Limited).

One Fume effectually destroys the whole family of **APHIDES.**

Two Fumes in quick succession will annihilate the **THRIP.**

IN IRON,  
6s. 6d.

IN COPPER,  
21s.

**IMPROVED FUMIGATING PAN,** ALSO THE IMPROVED AND ONLY GENUINE **MEDICATED TOBACCO PAPER,** “Ready Cut Up,” “Self Consuming,” “Most Effective,” “Perfectly Safe.”

This “Special” Article has now been extensively used by Horticulturists for some years, and hundreds can bear testimony to the fact that it is the cheapest, safest, and most efficacious Asphyxiate in the market.

TO BE OBTAINED ONLY FROM

**JAMES DICKSON & SONS,**  
108, EASTGATE ST., CHESTER.

Who will be pleased to send, post-free, on application, Circular containing Testimonials and all particulars.

Price, 1s. 8d. per pound.

Carriage Paid on Orders of 28 lb. and upwards.

Catalogues Free on application.

**COALS FOR HOTHOUSE PURPOSES.**

**WOOD AND CO.'S**  
**STAR ANTHRACITE SMOKELESS STEAM COAL**  
is now being extensively used by many of the principal Growers, and is found to be preferable to any other kind of fuel in respect to cheapness and durability, and particularly on account of its being perfectly free from sulphur, and that it does not clinker the fire-bars.  
WOOD AND CO. deliver in truckloads to any Railway Station, prices for which can be had on application, or can be delivered by Wood & Co.'s Vans (in the Metropolis).  
WOOD AND CO. append a testimonial given to them by Messrs. Beckwith & Sons, a firm of great experience, and who have kindly allowed them to make whatever use of it they may think fit.

Tottenham Nurseries, London, N., Dec. 28, 1877.  
To Messrs. Wood & Co.  
Dear Sirs,—With reference to your enquiry respecting the "Star" Anthracite Coal with which you supplied us—as to how it suited, its economy or otherwise—we have much pleasure in informing you that in every respect it is the best Anthracite we have ever used. We find there is no smoke from it, which is very essential, and there is no trace of sulphur. It requires very little stoking, and leaves very little ash, and certainly does not clinker. Our consumption of coal is about 500 tons a year, and we have no hesitation in saying that, by using your "Star" Coal in the place of ordinary fuel, we shall effect a saving of at least £100 this year. We attribute this to the powerful and lasting properties of your Coal.—Yours faithfully,  
(Signed) G. Beckwith & Sons.  
WOOD AND CO. supply all kinds of Coal for House and Manufacturing purposes, in single truckloads, to any Railway Station, at Wholesale rates, prices for which will be sent on application.  
WOOD AND CO., Coal and Coke Factors, Merchants, Contractors to Her Majesty's Government, 58, Coal Exchange, E.C.; and 4, Coal Department, Great Northern Railway, King's Cross, N.; and Midland Sidings, St. Pancras, N.W.; 94, High Street, Kensington; London, Chatham and Dover Railway Coal Depot, Elephant and Castle; and Great Northern Railway Coal Depot, Sydney Road, Hackney Wick, E.

J. SMITH, The Royal Label Factory, Stratford-on-Avon.

As adopted for the Prince of Wales, at Sandringham.  
**HELLIWELL'S PATENT**  
All outside Wood is covered. No Painting Required.  
*Cost of House Saved in Ten Years. No Rattle or Looseness of Squares. No Breakage from Expansion or Contraction. Squares instantly replaced.* TESTIMONIALS.—"Sir: I went yesterday and examined the glass roof glazed by you, under my directions, at Sandringham, for H.R.H. the Prince of Wales, and find it perfectly satisfactory in all respects. The appearance is vastly superior to the old system of wood and putty, and I shall be glad to recommend it whenever I can. Yours faithfully (Signed) C. Smedley Beck, Architect. T. W. Helliwell, Esq., "Mark Lane, London, Nov. 14, 1878. Dear Sir: I cannot see what Testimonial you can require from me, than the fact that I have taken off all my putty glazings, and removed —'s work to replace it with yours. Any one seeing the two systems would say that yours is far the superior, and that nothing yet out can touch it. Yours, W. R. Preston. T. W. Helliwell, Esq., Brighouse." For Estimates, Drawings, or Particulars, apply to the Patentee, T. W. HELLIWELL, Brighouse, Yorkshire.

WILLIAMS begs to intimate that he has at present in the Nursery and upon his Register some excellent Men, competent either to fill the situation of HEAD GARDENER, BAILIFF, FOREMAN, or JOURNEYMAN. Ladies and Gentlemen requiring any of the above will please send full particulars, when the best selections for the different capacities will be made.—Holloway, N.

JOHN COWAN, The Vineyard and Nurseries, Garston, is at present in a position to recommend a Scotch GARDENER for a large establishment, whose character and abilities may be thoroughly depended upon.

TO GENTLEMEN and MARKET GROWERS.—Advertiser would undertake to Manage a Business for a Gentleman, with a large amount of Glass, or intending to Build, to grow on an extensive scale entirely for Market, Grapes, Peaches, Strawberries, Mushrooms, Cucumbers, &c. Also choice Flowers, best adapted to supply a first-class Cut Flower Trade demand. First-class references.—J. READ, 5, Duffield Street, Battersea, S.W.

To the Trade. MANAGER, in a First-class Business, where Hard and Soft wooded Plants, Cut Flowers, Cucumbers, &c., are in great demand.—Age 35; accustomed to the supervision of a large staff of men. State salary and particulars.—REX, Mr. Hudson, 3, Commerce Place, Clapham Junction, London, S.W.

GARDENER (HEAD).—No family; thorough practical in every branch of Gardening in good establishments, Land and Stock.—GARDENER, 16, Faroe Road, West Kensington Park, London, W.

GARDENER (HEAD).—Age 27; thoroughly experienced in Plant and Fruit Growing, Early and Late Forcing, Flower and Kitchen Gardening, &c. Good references.—A. J. OXFORD, Rushton Park, Battle, Sussex.

GARDENER (HEAD).—Age 30; can be highly recommended. No single-handed place accepted.—C. SPALL, 11, Mexican Terrace, Caledonian Road, King's Cross, London, N.

GARDENER (HEAD).—Mr. DELL would be pleased to recommend his Foreman, Thomas Brown, to any Lady or Gentleman in want of a steady industrious man. Understands the profession in all its branches.—Patshull Gardens, Wolverhampton.

GARDENER (HEAD).—Age 34, married, no family; understands Stove and Greenhouse Plants, Orchids, Early and Late Forcing, Flower and Kitchen Gardening. Seventeen years' experience.—D. D., Bleadworth Lodge, Hordean, Hants.

GARDENER (HEAD), where four or more are kept.—Age 30, single; thoroughly experienced in all branches, and well up in Growing for Market, Forced Fruit, Vegetables, and Cut Flowers. Unquestionable references.—G. C., King Harold, Harold Wood, Romford.

**GARDENER (HEAD).**—Mr. JUDD, Gardener to the Rt. Hon. the Earl of Warwick, will be pleased to recommend to any Nobleman or Gentleman a thoroughly efficient man as Head Gardener; an expert Plantsman and an excellent Fruit Grower, and one competent to manage a large establishment.—The Castle Gardens, Warwick.

**GARDENER (HEAD);** age 30.—W. DAVIDSON, Gardener to the Earl of Harrowby, Sandon Hall, Stone, Staffordshire, will be pleased to recommend S. Brown to any Lady or Gentleman requiring a thorough practical and energetic man, who has been here as principal Foreman for four years, with credit to himself and to my entire satisfaction.

**GARDENER (HEAD).**—T. PATON wishes to treat with any Nobleman or Gentleman requiring the services of a good practical Gardener. For the last seven years was Head Gardener to Sir Henry Scudamore Stanhope, Bart., Iolme Lacy, Herefordshire; was thirteen years Head Gardener in previous situation. First-class testimonials.—T. PATON, Mirfield Cottage, Oxford Street, Leamington.

**GARDENER (HEAD);** age 31, single.—PETER CONWAY, Foreman three years and a half in Lord Leconfield's Gardens, Petworth, Sussex, is open to engage with any Lady or Gentleman requiring the services of a thoroughly respectable and persevering man. Well versed in all matters connected with the profession. Good experience in first-class places. Can be highly recommended by Mr. Breese, and other Gardeners with whom he has lived.

**GARDENER (HEAD);** age 28.—THOMAS CARLTON, Gardener to Sir Charles H. Mills, Bart, M.P., is prepared with every confidence to recommend George Hester is above, who has been for the past three years principal Foreman in these gardens. He is thoroughly practical in all branches of Gardening, and well qualified to undertake the Management of a good Establishment. Testimonials for abilities and character of the highest order.—Mr. THOMAS CARLTON, The Gardens, Wildernes Park, Sevenoaks.

**GARDENER (HEAD),** first-class; age 34, married, one child; Protestant.—THOMAS WOODFIELD, for four years Head Gardener with present employer, will be happy to engage with any Nobleman or Gentleman in be above capacity. Well up in all kinds of Ground-work, Superintending Labour, &c. Present employer will give good character. Late principal Foreman at Burghley, under Mr. R. Gilbert, who will be happy to answer any enquiries.—T. WOODFIELD, Watcombe Park, Torquay.

**GARDENER (HEAD);** age 45, married, one child (age 10).—MR. BAINES, Southgate, London, N., can recommend to any Nobleman or Gentleman, in want of a Gardener, a thoroughly intelligent and trustworthy man, who has not adopted the calling simply for a living, but has from boyhood been heart and soul in the pursuit. Is one of the best Fruit, Plant, and Vegetable Growers in the country. Fully capable to plan and carry out new work or alterations, including Horticultural Buildings. Can be highly recommended by the gentleman he has served as Head Gardener for nine years.—Address as above.

**GARDENER (HEAD, WORKING);** age 28.—A GENTLEMAN wishes to recommend a Head Working Gardener, who is thoroughly competent.—Apply, in first instance, to G. S., Braunston, Oakham, Rutland.

**GARDENER (HEAD, WORKING).**—Age 39, married; twenty years' experience in all branches. Nearly three years' character from last place.—S. COOK, t, The Grove, Crouch End, Hornsey, N.

**GARDENER (HEAD, WORKING),** where two or three are kept.—Age 26, married, no encumbrance. Fourteen years' experience in all branches of the profession. Excellent testimonials.—A. B., 2, Jarvis Road, Aptoofield, Bishop Stortford.

**GARDENER (HEAD, WORKING).**—Age 29, single; twelve years' practical experience in all branches of the profession. Good recommendations from Noblemen and Gentlemen.—S. N., 6, Cromwell Terrace, Birkbeck Road, Upper Holloway, N.

**GARDENER (HEAD, WORKING).**—Age 36, married; practical in all branches. Excellent character from present and former employer. Cause of leaving, Gentleman giving up his establishment.—J. B., Hortus, Southall Green, Middlesex.

**GARDENER (HEAD, WORKING),** where one or more are kept.—Age 30, married; understands the profession in all its branches, also Measuring and Felling of Timber. Good Flower and Kitchen Gardener.—J. S., Widmore Lodge, Bromley, Kent.

**GARDENER (HEAD, WORKING).**—Age 40, married, no family; has had extensive practice in all branches of Gardening, in Forcing Flowers and Fruit; good Strawberry Grower—has taken prizes for them; also Vegetables. Eighteen years' practical experience. Five years' good character.—G. L., 13, Limes Road, Beckenham, Kent.

**GARDENER (HEAD, WORKING),** where three or more are kept.—Age 29, single until suited; experienced in the general routine of Gardening, especially in Grape, Melon, and Cucumber Culture. Four and a-half years as Foreman in present situation. Good recommendation.—J. FRY, Leybourne Grange, Maidstone.

**GARDENER (HEAD, WORKING).**—Thoroughly understands the Growing of Early and Late Vines, Peaches, Strawberries, Nectarines, Melons, Cucumbers, and Flower and Kitchen Gardening. Can also undertake the Management of Farm and Stock. Wife good Dairy and Poultry if required. Ten years' good character.—E. H. PULIN, Grocer, Chorleywood, Rickmansworth, Herts.

**GARDENER (HEAD, WORKING),** where two or more are kept.—Age 26; over twelve years' thorough practical experience in all branches; well up in all kinds of Plants, Fruit, and Flowers, and general routine of Gardening. Can be highly recommended. Four years' excellent character from present employer.—W. E., Messrs. Sutton, Fareham, Hants.

**GARDENER (HEAD, WORKING).**—Twenty-five years' experience. Understands Pigs, Poultry, Stock, and Land, if required. First-class references. No objection to Grow Fruit and Flowers for Market.—Address with particulars, M. H. WOOD, Cat End, Epsom, Surrey.

**GARDENER (HEAD, OF SINGLE-HANDED).**—Understands Vines, Pines, Stove and Greenhouse Plants, and Flower and Kitchen Gardening.—J. L., 1, Hall Street, Churchgate, Stockport.

**GARDENER (HEAD, OF SINGLE-HANDED).**—Thoroughly understands Stove and Greenhouse Plants, Vines, Cucumbers, Melons, &c. Eight years' experience.—W. BRAIN, Claydon House, Bucks.

**GARDENER (HEAD, or good SINGLE-HANDED)**—One boy, aged 10; practical experience in the cultivation of Stove and Greenhouse Plants, Ferns, Vines, Kitchen Garden, and Pleasure Grounds. Good character.—D. H., 82, Malham Road, Forest Hill, S.E.

**GARDENER (HEAD), or GARDENER and BAILIFF.**—Age 35; eighteen years' experience. Five years' unexceptionable character from last situation. E. 31, C. H. May & Co., General Advertising Offices, 78, Gracechurch Street, E.C.

**GARDENER,** where one or more are kept, or SINGLE-HANDED.—Age 24, single; eight years' good reference.—Apply, stating wages, to W. H. S., 3, Albert Street, Dawlish, Devon.

"By a thorough knowledge of the natural laws which govern the operation of digestion and nutrition, and by a careful application of the fine properties of well-selected Cocoa, Mr Epps has provided our breakfast tables with a delicately-flavoured beverage which may save us many heavy doctor's bills. It is by the judicious use of such articles of diet that a constitution may be gradually built up until strong enough to resist every tendency to disease. Hundreds of subtle maladies are floating around us ready to attack wherever there is a weak point. We may escape many a fatal shaft by keeping ourselves well fortified with pure blood and a properly-nourished frame."—*Civil Service Gazette.*  
**EPPS**  
**COCOA.**

AND  
**COMFORTING.**  
JAMES EPPS AND CO., HOMOEOPATHIC CHEMISTS.

**DINNEFORD'S MAGNESIA.**  
The Medical Profession for over Forty years have approved of this pure solution as the Best Remedy for  
**ACIDITY OF THE STOMACH, HEARTBURN, HEADACHE, GOUT, AND INDIGESTION,**  
and as the safest Aperient for Delicate Constitutions, Ladies, Children, and Infants.

**DINNEFORD'S MAGNESIA.**  
More Cures (this week) of Severe Coughs and Difficulty OF BREATHING BY  
**DR. LOCOCK'S PULMONIC WAFERS.**  
Mr. PARRISON, M.P.S., 450, Oldham Road, Manchester, writes:—"I can with confidence recommend the Wafers to persons suffering from Coughs and difficulty of Breathing." Asthma, Consumption, Bronchitis, Colds, and Rheumatism, are instantly relieved and rapidly cured by Dr. Locock's Wafers, which taste pleasantly. Sold at 1s. 1/2d. and 2s. 9d. per Box.

**HOLLOWAY'S PILLS** can be confidently recommended as a domestic remedy for the ailments of all classes and conditions of people. Young and old of both sexes may take this medicine with the certainty of deriving benefit from its use, when disorder or disease is making them miserable. Holloway's Pills are unrivalled for their purifying, aperient, and strengthening properties. They remove indigestion, palpitation, and headache, and are specially serviceable in complaints peculiar to females. Each box is wrapped with printed instructions for the guidance of invalids, who will readily understand, from carefully studying them, the best way of recovering health. Holloway's Pills will work a thorough change in the constitutions of the weak and nervous,

SALES BY AUCTION.

5000 Liliun auratum, and a great variety of other RARE LILIES, PLANTS AND BULBS.

MR. J. C. STEVENS will sell by AUCTION, at his Great Rooms, 38, King Street, Covent Garden, W.C., on MONDAY, February 9, at half-past 12 o'clock precisely, 5000 splendid bulbs of LILIUM AURATUM, just arrived from Japan in fine condition; 4000 good roots of TIGRIDIA GRANDIFLORA and T. CONCHIFLORA, from New Jersey; 2000 magnificent American TUBEROSES, just arrived from Pennsylvania; an importation of BULBS from the Cape; a consignment of Rare Indian LILIES, SARRACENIAS, from America; fine imported roots of LILIUM LANCIFOLIUM RUBRUM and ALBUM, from Japan; a consignment of rare BULBS from Florida; twenty cases of various LILIES, just arrived, comprising many hundred bulbs in each case; various ENGLISH-GROWN LILIES, SPIRÆAS, LILY of the VALLEY, GLADIOLI, &c.

On view the morning of Sale, and Catalogues had.

Lælia anceps alba.

MR. J. C. STEVENS has received instructions from Mr. F. Sander to SELL by AUCTION, at his Great Rooms, 38, King Street, Covent Garden, W.C., on THURSDAY, February 12, at half-past 12 o'clock precisely, a most magnificent importation of LÆLIA ANCEPS ALBA, collected in flower by Mr. F. Felchack, just to hand in splendid condition, among them grand masses, one having 200 bulbs. This is undoubtedly the finest introduction of late years, and extremely rare in its native habitat. Also a large lot of ODONTOGLOSSUM VEXILLARIUM, collected by Mr. C. Falkenberg, and in splendid condition, among them large masses. A large importation of CATTLEYA MENDELII, several other importations of value, and among others ODONTOGLOSSUM RAMOSISSIMUM, CATTLEYA MAXIMA, NANODES MEDUSA, CHYSIS AUREA, very rare MASDEVALLIAS, ODONTOGLOSSUM ROSSI MAJUS, MORMODES PARDINUM, UKOPEIDIUM LINDENI, ONCIDIUM UNICORN. The whole of the importations are in the finest condition.

On view the morning of Sale, and Catalogues had.

Imported Orchids from the New Plant and Bulb Co.

MR. J. C. STEVENS will sell by AUCTION, at his Great Rooms, 38, King Street, Covent Garden, W.C., on MONDAY, February 16, at half-past 12 o'clock precisely, a fine consignment of Orchids, consisting of Cattleya Mendelii, Odontoglossum Pescatorei, triumphans, Phalenopsis, and some splendid established plants of ODONTOGLOSSUM ALEXANDRE, &c.

Further particulars next week. On view the morning of Sale, and Catalogues had.

On Monday Next.

4500 LILIUM KRAMERI, just arrived from Japan in unusually fine condition; also a quantity of LILIUM AURATUM, several hundreds of the lovely MONTBRETIA POTSHI and ROSEA, also DISA GRANDIFLORA and other BULBS, from the Cape; imported Roots from California and South America; a splendid assortment of English-grown LILIES, including very large L. Brownii, giganteum, pardalium, and Humboldtii; TIGRIDIAS, GLADIOLUS, CARNATIONS, PICOTÉES, CLOVES, PINKS, PÆONIES, &c.; together with 80 lots of choice established ORCHIDS, from private collections, for unreserved sale; and 3000 very fine Bulbs of AMERICAN TUBEROSES.

MESSRS. PROTHEROE AND MORRIS will sell the above by AUCTION, at the Mart, Tokenhouse Yard, near the Bank, E.C., on MONDAY NEXT, at half-past 11 o'clock precisely. Catalogues at the Mart, at 163, Gracechurch Street, E.C.

Exeter.

MESSRS. PROTHEROE AND MORRIS are instructed by Messrs. Lucombe, Pince & Co., who are giving up their branch Nursery at Exminster, near Exeter, to SELL by AUCTION, on the Premises, on TUESDAY and WEDNESDAY, February 17 and 18, the whole of the valuable NURSERY STOCK, in excellent condition and fit for immediate planting, lotted to suit all purchasers; also an unrivalled collection of choice named FRUIT TREES, in the usual varied forms of training, at the Home Nurseries. May now be viewed. Catalogues had at the Exeter Nursery, and of the Auctioneers and Valuers, 93, Gracechurch Street, E.C., and Leytonstone, Essex.

Cheltenham.

PRELIMINARY NOTICE of a most important SALE of SPECIMEN EXHIBITION STOVE and GREENHOUSE PLANTS, PALMS, FERNS, &c. MESSRS. PROTHEROE AND MORRIS are favoured with instructions from Edward Pilgrim, Esq., who is giving up exhibiting, to offer for unreserved SALE by AUCTION at Cheltenham, early in the Spring, the whole of his unrivalled COLLECTION of SPECIMEN PLANTS, which have won the highest honours at the chief Metropolitan and Provincial Shows.

Extensive Nursery Clearance Sale at Dalkeith.

MR. DAVID MITCHELL, HORTICULTURAL AGENT, VALUATOR, and ESTATE AGENT, has received instructions from Messrs. Ballantyne & Son (who are retiring from the nursery business) to DISPOSE OF, by PUBLIC AUCTION, at their Nurseries, Dalkeith, on THURSDAY and FRIDAY, February 13 and 20, at 11 o'clock in the forenoon of each day prompt, the whole of the valuable NURSERY STOCK, consisting of choice Ornamental, Deciduous, Coniferous, and Evergreen Trees, Shrubs, and Plants, many of them of rare excellence and even unique in character; also a fine lot of Specimen Hybrid, named, and other Rhododendrons of leading kinds; Hardy Ericas, Herbaceous and other Plants; a most extensive stock of well-grown and well-rooted Forest Trees; together with a splendid lot of Laurels, comprising Colchic, Caucasian, Common, and Portugal; and other things too numerous to mention in an Advertisement.

N.B. The Auctioneer would beg to draw the attention of those intending to plant to this most important Sale. The Messrs. Ballantyne & Son's Nurseries have always been famous for well-grown and well-rooted Shrubs and Trees. Catalogues in preparation.

6, Comely Bank, Edinburgh, February 4, 1880.

WANTED TO RENT, with immediate possession, till the end of March next, one large SPAN-KILOFF GREENHOUSE, not less than 50 feet in length, 12 to 15 feet wide; also a SMALLER HOUSE, with good hot-water heat, within a radius of 15 miles from London. Address, J. B. 13, B. Hoia Road, Abbey Road, N.W.

Goodwill of Seed Business for Sale.

TO BE SOLD, by Private Contract, the GOODWILL of an Old-Established SEED WAREHOUSE, in Belfast, together with the Stock and Fixtures, as the Owner is retiring from business.

The purchaser can go into possession IMMEDIATELY, without any interruption to the business. An extensive and profitable trade has hitherto been carried on.

For particulars apply to G. P., Gardeners' Chronicle Office, W.C.—January, 31, 1880.

Southend, Essex.

TO NURSERYMEN and MARKET GARDENERS.

TO BE SOLD, by Private Contract, in consequence of the death of the late occupier, all that VALUABLE LEASEHOLD PROPERTY, about 22 years unexpired, containing about 7 acres, with the two Eight-roomed Houses and Cottage adjoining, also the Barn, Stable and other Outbuildings, and the several large Greenhouses erected thereon, all in good repair, together with the Contents of the said Greenhouses and of the Garden, which is well stocked with Fruit Trees in full profit and in an excellent state of cultivation; the soil is also admirably adapted for the cultivation of Roses, which are a source of great profit: the whole forming a choice and lucrative investment, and, on account of its direct and easy access to Town, one seldom met with. The property is known as The Beach Nurseries, and lies on the eastern side of the town, with a frontage to the sea.

For further particulars apply to Messrs. MONTAGU, SCOTT and BAKER, Solicitors, 10, Gray's Inn Square, London, W.C., and Hatfield, Herts.

The Green Lane Nurseries, Heaton Norris, near STOCKPORT.

TO BE SOLD, as a going concern, the above NURSERIES, consisting of about 8 acres of a large and choice stock of Forest, Fruit, and Ornamental Trees, Flowering Shrubs, &c., also the choice collection of Stove and Greenhouse Plants at the Wellington Nurseries, Heaton Chapel, near Stockport.

For further particulars apply to Mr. N. CALVERT, Accountant, 24, St. Peter's Gate, Stockport, or to Mr. B. WHITHAM, The Nurseries, Reddih, near Stockport.

Wandsworth and Wimbledon.

TO LET, by Tender, FARM and ACCOMMODATION LANDS, with immediate possession—230 Acres—together, or in separate lettings, to suit Tenants.

Particulars of Mr. ALFRED W. OBORNE, Resident Agent, Wimbledon Park, to whom Tenders should be sent before February 20, next.

TO LET, ROSEHILL GARDENS,

NORTON, and may be entered upon at the November Term—the above Gardens comprising about 7 acres of first-class Garden ground, with the Dwelling-house, Vineries, &c. Now in the occupation of Mr. T. Ohver as Tenant. For particulars apply to J. J. FENNY, Stockton-on-Tees.

PROTHEROE AND MORRIS, HORTICULTURAL, MARKET GARDEN and ESTATE AUCTIONEERS and VALUERS, 93, Gracechurch Street, City, E.C., and at Leytonstone, E. Monthly Horticultural Register had on application.

Fifty Nurseries, Market Gardens, Florist and Seed BUSINESSES to be DISPOSED OF.

MESSRS. PROTHEROE AND MORRIS, HORTICULTURAL REGISTER contains full particulars of the above, and can be obtained gratis at 93, Gracechurch Street, E.C.

J. T. DEANE, LANDSCAPE GARDENER.—Planting by Contract or Otherwise, Ornamental Lakes, Rockwork, &c. References kindly permitted to Noblemen and Gentlemen—places already carried out. Plans and Estimates furnished.—Wellesley House, Wellington Road, Orpington, Kent.

**TREE PLANTING:  
AN INVESTMENT.**

That Timber Growing will be found to be a profitable application of the soil, and a sound investment to Capitalists in the future, is being made obvious by the increasing demand for Wood, and its anticipated scarcity in places abroad.

Nurseries have long been noted in Scotland for successfully and cheaply raising FOREST and other TREES, and the Subscribers devote every attention to conducting efficiently one of the largest establishments in the country.

In connection with their business arrangements Correspondents are respectfully reminded that their Priced CATALOGUES are sent, post-free, on application. The prices are quoted as reasonable as any. Plants are fibrous-rooted, robust, and grown unsheltered. Inspection of Nurseries invited, but if inconvenient, Samples of Trees will be furnished. Planting contracted for, Carriage Rates lessened, and Packages saved by using "Through Trucks." Export Orders carefully supplied, and Correspondence solicited.

**FLOWER SEEDS.**  
CHOICEST OF THE CHOICE.  
OWN SAVED.

H. CANNELL wishes to announce that his Illustrated CATALOGUE of 60 Pages and upwards of 100 Engravings, exclusively devoted to Flowers, is now ready, and sent post-free. Its practical information, especially for Amateurs, far surpasses anything of the kind ever issued, and the Seeds that he has for Sale are certainly the best ever offered.

How I Grow and Save them.

THE above is now admitted throughout the world to be the most replete Illustrated and Descriptive CATALOGUE of Florists' Flowers and their Seeds ever issued. No garden of the least pretence should be without this work; even the professional refers to it for guidance, as it describes all the best varieties (new and old) in cultivation, supplied either as Cuttings, Rooted Cuttings, or Plants, at the lowest price consistent with correctness.

H. CANNELL wishes to announce that his stock of POT ROOTS consists of not less than 10,000, and are in fine condition. Price from 6s. to 18s. per dozen. H. C.'s selection, in 100 distinct first-class kinds, for £2. PARAGON and other choice single varieties. Price LIST on application.

**Fuchsia Stock Plants.**  
H. CANNELL has several thousand old Stock Plants, full of Cuttings, 18s. to 35s. per dozen. Nothing could be better for working up a large quantity of plants for market or exhibition. Cuttings, 12 for 1s. 6d., 50 for 5s., 100 for 9s., H. C.'s collection, post-free.

**Calceolarias.**  
H. CANNELL has now a fine lot of the above, 2s. 6d. per dozen, post-free; established in small pots, 3s.; in 6's, 4s.; in 5-inch pots, 6s. per dozen. CINERARIAS.—Fine plants in bud, and will make a show at once, 6s. per dozen. CYCLAMEN ditto, per 100 or 1000 on application.

IT has long been known that my TOBACCO FUMIGATING MATERIAL, both by the quantity sold and the perfection to which I grow my plants, must be by far the best. 1s. 8d. per lb.; 5 lb., 7s. 6d.; 28 lb., £1 10s. No apparatus required. H. C.'s secret and every particular of his art of exterminating the fly for a long time sent with every parcel. J. J. SMITH, Esq., Willow Lodge, Muddiford, Christchurch, Hants, December 22, 1879.

"I will thank you to send me 6 lb. of your Tobacco Cloth for it is the best which I have ever used and the least trouble."

**H. CANNELL,**  
THE HOME FOR FLOWERS,  
SWANLEY, KENT.

Westwood Park Late White Broccoli.  
**RICHARD SMITH AND CO.**  
I have pleasure in again offering this excellent BROCCOLI, and respectfully solicit early Orders, as the stock this season is limited. Price 1s. 6d. per packet, the usual discount to the Trade.  
From *The Gardener*, July, 1876:—"The most valuable Broccoli we have seen this year is a kind coming into use in June; it is very white, and of large size before the leaves expand, and though yet in a private garden, we hope to see it comeable by the public. It is growing in Westwood Gardens, near Drotwich, and Mr. Gough, the gardener, has been saving seed from the finest heads for some years, and has been rewarded with great success."  
RICHARD SMITH AND CO., Seed Merchants, Worcester.

WILLIAM BARRON & SON,

ELVASTON NURSERIES, BORROWASH, DERBY.

# LÆLIA ANCEPS ALBA.

MR. J. C. STEVENS has received instructions from Mr. F. SANDER to SELL by AUCTION, at his Great Rooms, 38, King Street, Covent Garden, W.C., on THURSDAY, February 12, at half-past 12 o'Clock precisely, a most magnificent importation of LÆLIA ANCEPS ALBA, collected in flower by Mr. F. PEHACEK, just to hand, in splendid condition, among them grand masses, one having 200 bulbs. This is undoubtedly the finest introduction of late years, and extremely rare in its native habitat. Also a large lot of

## ODONTOGLOSSUM VEXILLARIUM,

collected by Mr. C. FALKENBERG, and in splendid condition, among them large masses. A large importation of CATTLEYA MENDELII; several other importations of value, and among others ODONTOGLOSSUM RAMOSISSIMUM, CATTLEYA MAXIMA, NANODES MEDUSÆ, CHYSIS AUREA, very rare MASDEVALLIAS, ODONTOGLOSSUM ROSSI MAJUS, MORMODES PARDINUM, EUROPEDIUM LINDENI and ONCIDIUM UNICORNE.

THE WHOLE OF THE IMPORTATIONS ARE IN THE FINEST CONDITION.

*On view the morning of Sale, and Catalogues had.*

AUCTION ROOMS AND OFFICES, 38, KING STREET, COVENT GARDEN, LONDON, W.C.

# AMIES' HORTICULTURAL MANURE.

*This celebrated Manure has now been before the public for 8 years. It is pronounced by the most eminent Horticultural Authorities, the Trade, and numerous practical Horticulturists to be the most efficacious Manure ever introduced.*

No Horticultural Manure has been so successful. It has the largest sale, is perfectly free from adulteration, is cheaper, and differs in its composition and action from all other manures.

To ensure the confidence of the Public, we now publish an Analysis of our Manure, and Reports by Dr. AUGUSTUS VOELCKER, the eminent Chemist to the Royal Agricultural Society, and Mr. BERNARD DYER, Analytical and Agricultural Chemist.

ANALYSIS.			
Moi-ture .. .. .	.. .. .	.. .. .	4 03

## REPORTS.

"I have the pleasure of sending you herewith the results which I obtained in the analysis of a sample of your Horticultural Manure. This Manure, it will be seen at a glance at the enclosed analysis, in addition to a high percentage of Phosphate of Lime (bone phosphate), contains, in well-balanced proportions, Salts of Ammonia, yielding about 4 per Cent. of Ammonia, Potash Salts, and other useful fertilising ingredients, and thus differs materially in its constitution from purely Ammoniacal Manures, which, containing exclusively or in excessive proportions, Ammonia, are apt to cause over-luxuriance of the leafy parts of plants at the expense of their healthy and vigorous growth and proper maturity of 'Horticultural' produce.

"The sample analysed by me was in a dry condition, finely prepared, and in my opinion a concentrated, intrinsically valuable fertiliser, and well adapted for general 'Horticultural' purposes.

"I may add that it has no unpleasant smell, and for this reason this Manure may be used with advantage, and without inconvenience, in conservatories and other places where strong smelling compounds are inadmissible.

"AUGUSTUS VOELCKER, Ph.D., F.R.S., F.C.S., &c."

"The accompanying are the results of my analysis of a sample of Amies' Horticultural Manure. It contains an ample supply of Potash, Nitrogen, and Phosphates in a favourable condition for assimilation by plants, the Nitrogen being in a fixed and soluble form.

"The Manure is in a dry and finely divided condition, and therefore in a convenient form for 'Horticultural' use. It is free from any considerable acidity, which is undesirable in Manures intended for purely 'Horticultural' purposes, but at the same time contains ingredients capable of fixing any Ammonia generated by the decomposition of organic matter in the soil itself. The carbon which this Manure contains will tend to maintain a 'sweet' and healthy condition of the soil; and certain of the other chemicals entering into its composition are possessed of antiseptic or antifungoid, and probably also of insecticidal properties, which are calculated to enhance its effect as a Manure, by protecting the roots of plants to which it is applied from attacks of insects and parasitic diseases.

"BERNARD DYER, F.C.S., A.I.C., &c."

PRICES OF AMIES' HORTICULTURAL MANURE. (In Stamped and Sealed Bags.)

SATURDAY, FEBRUARY 7, 1880.

LONGPOD AND BROAD BEANS.

THE Bean, like the Pea, plays a very important part as an article of the national food, but secondary to it in importance. There are some persons who dislike the Pea as a vegetable for the table, and there are many more who reject the Bean. Perhaps the latter is thought to have plebeian associations which renders it unfit for the tables of the higher orders in society, though "bacon and Beans" is regarded as a delicacy by the *gourmand*. He that can enjoy his dish of Beans shows by so doing the possession of rude health.

It is said that the Bean has been cultivated in Britain from very remote antiquity. It is thought to have been introduced to this country by the Romans, though it is supposed to be of Egyptian origin. It is from the Greeks we have the earliest accounts of it, and it is thought they received it from that country as a cultivated vegetable.

The seed list of a leading wholesale house gives a list of twenty varieties of Beans in all, but these can be reduced by the deduction of certain synonyms. Of these twenty there are ten Longpods and five Windsors; the others are made up of the Dwarf Fan, Bog or Cluster, the Mazagan, and the white and scarlet-blossomed types.

One of the best known and earliest of the cultivated Beans is the Mazagan. It is a type by itself, with small seeds approaching in character very close to our common horse Beans, pods 4 or 5 inches long, rather narrow, and containing four or five seeds. The Mazagan Bean is supposed to have been originally brought from a Portuguese settlement on the coast of Africa, hence its name. When grown in that place the seeds are said to be smaller even than our horse Beans, but they grow to a larger size when cultivated in Portugal or this country.

Philip Miller, in the edition of his *Gardeners' Dictionary* published in 1731, enumerated "four sorts of Beans commonly planted in gardens, viz., the small Lisbon, the Spanish, the Sandwich, and Windsor Beans." In later days the common Early Longpod Bean came to be known as the Early Lisbon and the Sandwich, while the Windsor also came to be known as the Broad Spanish. How or when these various types of garden Beans originated—types showing differences amounting almost to specific variations—is involved in some obscurity. Modern writers have attributed to them terms which designate them as species, but it may be that they have originated from one or two common stocks. The largest seeded variety, known as the "Windsor," is said to have been first cultivated in that neighbourhood by some of the Dutch gardeners who came over to England at the Revolution. We have it on authority that there is a field near Eton still, or comparatively recently, called "the Dutchman's garden."

There is lying before us a seed catalogue

published by the seed-house already referred to as far back as 1853—that is, twenty-seven years ago—and it contains eighteen varieties of garden Beans, but includes two names not found in the list for the present year, namely, the “new Thick Windsor” and the “Toker,” the last a Longpod type. The former represented a Bean unusually thick at that point where the cotyledons issue, but it is no longer maintained as a distinct variety, and when required is obtained by sifting the Windsor Beans; those that do not pass through the mesh of the sieve represent the thickest seeds, and form the “Thick Windsors.” In its original form (and it would be very interesting if the origin of the name could be traced) the “Toker” differed from the Windsor in that the seeds were of an elongated oval shape, and though an excellent bearer, was considered of coarse quality. The name is still retained in some seed lists, though it has ceased to be cultivated as a distinct variety.

The green forms of the Longpod and the Windsor are in all probability sports from the normal form. The former is known as the Green Genoa, and the sport might have been of Italian origin, and introduced from there to this country. That garden Beans are sportive in character has been demonstrated in the case of “Beck’s Dwarf Green Gem,” which originated as a sport on a plant of the Dwarf Fan or Cluster, at Shipston-on-Stour. The Dwarf Fan is a distinctive type of Bean, and a garden variety, but only sparingly cultivated in gardens till the green form appeared about 1858 or 1859, when it was distributed by Messrs. Beck, Henderson & Child, and is now a standard garden variety, being very early, productive, and of excellent quality.

The white-blossomed and the scarlet-blossomed Beans are of tall growth, and the seeds about the size of those of the Mazagan. They are not grown for culinary or edible purposes, but as ornamental plants, and are mostly used in shrubberies for the display their flowers make. Their produce is not large, indeed they are spare croppers, the pods being of medium size, and containing generally four or five Beans. In the case of the scarlet-blossomed type, the colour of the flowers is generally of a bright red approaching to scarlet, but varying from a pale red to a dark or almost black colour. Miller mentions a black-blossomed Bean, which is very likely a variety of the red or scarlet, as it often approaches to a black colour. In the case of the white-blossomed variety the flowers differ from all others in being pure white, having no dark spots on the vexillum nor aile, so that it can be easily distinguished when in flower from the above circumstance. This variety possesses the curious anomaly of having the whitest flowers and blackest seeds of any.

One of our largest seed-houses requires every year for the purposes of trade something like 4000 bushels of Longpod Beans and 3000 bushels of Windsor Beans. These are required for garden and market purposes. The Green Windsor is not found in the London markets, but it keeps its colour better; it is finer in flavour, but not such a free bearer. It is worthy of note that, while Peas can be held over for a year or two without much, if any, depreciation in the matter of appearance, the white Beans become sadly discoloured in the course of the year, and are thereby rendered valueless for trade purposes, though the growth might be all that could be desired. The green varieties maintain their colour much better than the white-seeded types.

The Dwarf Fan Bean is in large demand in Scotland, and is grown there in preference to the others, probably because, being of dwarf growth, it does not suffer so much from the gales. In Ireland, Longpods are in large demand. In Lancashire and Cheshire Long-

pods are grown in large quantities. A great many Longpod Beans as well as Windsors come into the London markets; the neighbourhood of West Drayton, Slough, Mitcham, Streatham, &c., furnish the chief part of them.

The best Windsor Beans are grown in Suffolk for seed purposes, Longpods mainly in Kent; and, as in the case of Peas, when the contracts are made with the growers for a supply, selected stocks are sent for sowing. The Beans are harvested, threshed out, and the crops sent to London, as in the case of Peas, and they are then sifted in the first instance and handpicked by women. The season of 1879 produced very spare and much damaged crops, hence the leading kinds are scarce and higher in price.

Of late years some fine selections in the way of Longpod Beans have come into the London markets. They are the Seville Longpod and the Aqua dulcè, a new French variety having fine pods of great length. Then there is the Leviathan or Giant Windsor, a selection made by Mr. Ernest Benary, of Erfurt, the pods of unusual size, unusually productive, and of superior quality. These are all fine exhibition varieties; and now that the Longpod and Windsor Beans play such an important part in cottagers' and other exhibitions, where the culture of vegetables is encouraged, large-podded Beans are much sought for. In some parts of England where shows of this character are held there are classes for shelled Beans, and in others it is required that the pods be laid open, but the Beans not displaced.

Sometimes the Longpod Bean is grown in fields for market purposes as a first and early crop. No London market gardener cultivates either the Longpod or the Windsor Bean for market purposes to any great extent; we have to look farther afield for our supplies. In some cases breadths of Beans are planted along the lengths of fields in the form of bands, in order to form dividing lines between other crops. R. D.

## New Garden Plants.

### CYMBIDIUM COCHLEARE, Lindl.\*

“This Cymbid. is from Burmah, and the habit of the plant is more thin and graceful than that of *Cymbidium eburneum*.” This was written in Mr. Low’s letter. The rather narrow leaf is more than 2 feet long, with a median nerve, which is very prominent behind, and one lateral on each side, the breadth not quite equalling 2 centimetres. The inflorescence is very nice, according to my taste at least, since I do not sigh for scarlet and orange colours. A very thin, very hard, bent, blackish-violet peduncle bears lax, light brown, rather contiguous, long, broad, acuminate sheaths. The peduncle at hand has eight beautifully developed flowers, which make one think of no species excepting *C. elegans*, Lindl. The shape of the flowers is just the same, yet they are much longer and narrower. The bracts are almost obsolete, as Dr. Lindley has stated. The stalked ovaries are of a bright green, with a violet hue on the upper part. Chin nearly obsolete. Sepals, petals, and lip shining, as if covered with rubbed wax. Sepals almost linear, the odd one a little galeate, middle line light, greenish at the borders, both sides of a beautiful sepia-brown. Petals long, linear, a little broader towards the apex, with numerous small brown spots on yellowish-greenish ground. Lip long, unguiculate, deltoid; side lacinie quite abrupt, upright; middle lacinia sessile, with broad basis, triangular, rather blunt, wavy, with a narrow white border. This part is of good yellow,

\* *Cymbidium cochleare*, Lindl., Contrib. Ind. Orch.—“Gracilis caule tumido brevi; foliis linearibus acutis plurinerviatis; pedunculo gracillimo rigidissimo nutante, dimidio inferiori; vaginis oblongo-ligulatis obtuse acutis scariosis cinnamomeis laxis; racemo laxo plurifloro (8—13); bracteis minutissimis, ovaris pedicellatis anthesi brevibus (0.05 m.), perigonio campanulato connivente; sepalis (0.045 m.) linearibus apicem versus paulo dilatatis acutis; sepalis impari fornicato, tepalis subaequalibus, labello 2 basi valde angusta dilatato triangulo apice abrupte trifido, lacinia laterali magnis subtriangulis prope rectangulis, lacinia mediana sessili triangula undulata, carinis geminis in disco anteriori assurgentibus supra basin, lacinie mediae abruptis; columna elongata, trigona, apice incurva, caudicula obliqua quadrata; pollinibus pyriformibus in stipitibus cereis semilibus, postice fissis. Pedunculus atroviolaceus. Sepala brunnea linea mediana et marginibus flavo-oliv. Tepala flavidis purimix guttulis cinnamomeo-brunneis. Labello cereum maculis innumeris brunneis supra lacinias laterales; lacinia antica aurantiaca maculis rufis. Columna pallide viridiflava, guttulis antice violaceis. Sikkim, J. D. Hooker! Burmah, Boxall! H. G. Rehb. f.

or perhaps rather of deep orange colour, with very numerous red spots. When seeing it you must remember *Cymbidium giganteum*. Two almost obsolete yellow keels run from base to base of the anterior lacinia, but it is only there that they rise in such a manner as to deserve the name of keels. At the end they are abrupt; the whole side lacinia are of a light wax-yellow, with a very faint hue verging to olive-green, and covered with such an incredible quantity of reddish-brown spots as to make you think at a certain distance they were totally reddish-brown. The shape of column is as in *Cymbidium elegans*, Lindl., light whitish-green, with some scattered violet dots in front, and a copious exudation of nectar at the base. Anther and pollinarium very near those of the last-mentioned species.

I cannot help confessing that I felt very satisfied to recognise finally in the splendid material the almost obscure *Cymbidium cochleare* of Dr. Lindley. It was only gathered once in Sikkim by Dr. (now Sir) Joseph Hooker, but lucky as he was in the discovery, yet he was not so lucky to see the plant in its elegant *tourneur*, since it was in an advanced condition not admitting a successful examination. Thus Dr. Lindley saw the callus ending in a free spoon, which may have been quite accidental, since I found it ending bilobed as well as abrupt. Then Dr. Lindley could even not ascertain the shape of the apex of the lip. Having been enabled to make the most careful study, thanks to the liberality of the Kew authorities, I can now give evidence of the success of such liberality by writing a full and, as I venture to hope, rather satisfactory description of a plant that was previously very obscure. It is, indeed, a greater satisfaction to reveal one such mystery than to describe a multitude of new species. Our elegant species is quite a swell among the *Cymbidiums*. There is not the least difficulty in distinguishing this from *Cymbidium elegans*, which various of my English correspondents have sent me in a most splendid state. This one has a dense many-flowered inflorescence, and even middle lacinia of lip, broader sepals, and two upright lamellæ on base of the lip. These have been very well represented by Dr. Lindley (*Sertum*, 14), but his fig. 2, the pollinarium, is at variance with any one I have ever seen, which all had a nearly square, never a round, caudicula, with appended glandula. H. G. Rehb. f.

### LÆLIA DORMANIANA, n. sp. (hybr. ?)\*

The bulbs of this plant are most nearly like those of *Cattleya bicolor*, or of the rare *C. Wilsoniana* and *velutina*. They are terete, thin, slender, 1 foot being the average height. Leaves one or two, very cuneate, acute, oblong-ligulate (m. 0.13 by 0.025 as greatest breadth). Peduncle with two “to five” flowers, enclosed in part in a long, very narrow spathe. The flower at hand is about the size of that of a good *Cattleya superba*. Petals and sepals olive, greenish-brown, marbled outside with light port-wine colour, which is diffused as a light hue inside, excepting the top of the odd sepal and petal, which have numerous dark port-wine coloured spots around the limb, which look very pretty. Lip of the lightest purplish-white, with darker veins, and a beautiful middle lacinia of that warm mauve-purple which is the high merit of *Cattleya superba*. There are some few short purple lines on either side the serrulate blunt very short keels at the very base. Column white, ears of mauve-purple, as well as the border of the stigmatic hollow.

The anther contains four fully developed and four rudimentary pollinia, some cohering one with another. This is the usual case in all hybrids between *Lælias* and *Cattleyas*, as we know from those curious experiments made in the Royal Exotic Nursery of Messrs. Veitch by the zealous efforts of Messrs. Dominy and Seden.

The plant is said to be very free flowering, and as Mr. Blunt, who is not extravagant in his praises, called it magnificent, it may develop a good deal. Mr. Bullen tells me every plant is showing vestiges of flowers, even from small (*i.e.*, inch) bulbs.

I guess this to be a hybrid, probably between *Cattleya bicolor* and *Lælia pumila*. The latter suggested itself to me from the large ears to the column. A seed vessel, kindly given by Mr. Bullen (who sent not only various parts but even a strong plant with a shoot having leaves, brown beneath), is no reason to the contrary. The great tendency to produce flowers might be another argument for the hybridity. It recalls to my mind what Sir Trevor Lawrence said the other day about *Cypripedium Sedeni*.

Mr. Henry Blunt discovered the plant in Brazil in September last; Mr. Richard Bullen, Woodlands Nursery, Hither Green, Lewisham, London, S.E., introduced it; Mr. Charles Dorman, of The Firs, Laurie Park, Sydenham, London, S.E., first flowered

\* *Lælia Dormaniana* (n. hybr. ?).—L. pseudobulbo pedali teretiusculo demum sulcato monophyllo seu diphylo; foliis cuneato oblongo-ligulatis acutis; pedunculo 2—5” floreo, e spatha angusta; sepalis oblongo-ligulatis; tepalis paulo angustioribus, paulo undulatis; labello trifido, lacinia laterali sessili oblongo-obtusis, lacinia mediana obcordata transversa, carinulis serrulatis brevissimis in ima basi; columnæ auriculis dentatis magnis apteram tegentibus. H. G. Rehb. f.

it, as it appears; and the plant may justly bear the name of this gentleman. *H. G. Rehb. f.*

ODONTOGLOSSUM PESCATOREI LIMBOSUM, *n. var.*

This is a new variety, and a very remarkable one. It has the dark spots of *Odontoglossum Pescatorei purpuratum*, but very few of them. In addition to this the whole of the border of the anterior blade of the lip is adorned with numerous beautiful mauve-coloured spots. For this novelty I have to thank S. Cuning, Esq., Harberton, Hornsey Lane, Highgate, N. *H. G. Rehb. f.*

## GENERAL MUNRO, C.B.

It will be a surprise to many to learn that this officer, whose decease occurred on the 29th ult., had claims on the respect of his countrymen as a learned botanist as well as a distinguished soldier. Indeed, we do not overstate the case when we place his botanical achievements before his military services, great as they were. It is given to many men to be brave soldiers and excellent officers, but few there are among scientific men who have been able to attain a just and comprehensive knowledge of so vast and intricate a family as the grasses. That a such a knowledge should have been acquired in the broken leisure and amid the thousand impediments of active military duty, is, in itself, marvellous. His military career is briefly summed up in the following notice, extracted from the *Times* :—

"General William Munro, C.B., died at Montys Court, near Taunton, at the age of about sixty-four. The eldest son of the late Mr. William Munro, of Druidstoke, Gloucestershire, he was born about the year 1816, and entered the army as ensign in 1834. He was promoted to lieutenant in 1836, to captain (39th Dorsetshire Regiment of Foot) in 1844, and to major in 1852. He saw much active service in India, and was severely wounded at the battle of Maharajpore, for which he received the medal. He commanded the 39th Regiment in the Crimean campaign from the close of 1854, and was present at the siege and fall of Sebastopol; and he also commanded the supports of the 1st Brigade (3d Division) at the attack on June 18, 1855. His subsequent commissions bore date respectively—lieutenant-colonel, 1853; colonel, 1854; major-general, 1868; lieutenant-general, 1873; and general, 1878. In 1870 he was gazetted to a staff appointment in the West Indies, and was appointed colonel of the 93d Sutherland Highlanders in 1876. He was nominated a Companion of the Bath (Military Division) in 1857."

He was the commanding officer and acting Governor in Bermuda during the difficult times of the blockade runners, and the last years of his service were spent as the General Commanding-in-Chief in the West Indies. His career, then, was a distinguished one. Whether as a subordinate or as a commanding officer, he never allowed his scientific pursuits to interfere in the least with his military duties. Nevertheless, as we have said, he contrived to combine with them such a knowledge of general botany and horticulture, and so close a study, so searching an investigation of the characters, affinities, nomenclature, and classification of grasses, as to have been for many years the most trustworthy referee in that difficult order.

It is no wonder that General Munro published comparatively little. Think of the difficulties in the way of specimens and books, requisite for consultation and examination, to be encountered by an officer on active service. It is clear that such difficulties could not wholly be overcome, and that the botanist, under such circumstances, must necessarily be thrown very much on his own unassisted resources. This independent study has no doubt special advantages, so far as the individual is concerned, but when it becomes necessary to communicate his knowledge to others, then it is requisite to study and annotate the literature of the subject so as to adjust and correlate the results of his own researches with those of his predecessors and contemporaries. Apart from the difficulties of transport of books and specimens a great expenditure of time is required on the part of those who draw up original monographs, and that time is not likely to be available in the case of so active and conscientious a soldier as the late General Munro. Hence it is that, with the exception of a monograph on the Bamboos in the *Transactions* of the Linnean Society, General Munro published but little. That monograph, however, affords sufficient evidence of his ability, industry, and profound know-

ledge of his subject. It was elaborated, we believe, in one of the intervals of active service.

When, two or three years since, he retired from the army and established himself near Taunton, he at once commenced a general monograph of the whole order. This was intended to form one of the monographs in the series of such works now being issued in continuation of the *Protronus* by MM. Alphonse and Casimir de Candolle. To the abiding loss of botany this monograph remains incomplete. It is to be feared that a long time must elapse ere any competent monographer will take upon himself the irksome labour of elaborating such a work.

General Munro was frequently consulted by the conductors of this journal on points relating to grasses. Several of his contributions to our knowledge of cultivated Bamboos were published in these columns, and the General had promised to favour us with a complete horticultural monograph of Bamboos and other grasses, scientifically known, we may almost say, to him alone. It will be felt as a matter of great regret that this promise cannot be fulfilled.

It is characteristic of the man that when serving in the Crimea as Commander of the 39th he contrived to send home bulbs and other plants, and to discover near Sebastopol interesting relics of Greek art, some of which, as we learn from Sir Joseph Hooker, are now in the British Museum.

To gardeners the career of General Munro has additional interest, inasmuch as he himself was an enthusiastic practitioner. Gardening with him was no selfish pursuit indulged in for his own gratification. In various stations in India, in Canada, and in the West Indies, he established gardens for the recreation and comfort of the soldiers.

In private life the General might have been taken as the type of the soldier—*sans peur et sans reproche*, and of the gentleman—high-principled, firm, yet gentle and courteous; he won cheerful obedience where others would have had to command it, and he secured the heartfelt respect and esteem of those with whom he was associated.

## CONCERNING FLOWER SHOWS.—I.

EVERY one who has had much experience of flower shows in the country must be aware of the varying degrees of success attending their management. Some shows are admirable in all respects; intelligent foresight, well arranged plans, a good organiser at the head of affairs, ensure a minimum of friction where a good deal of close contact and conflicting interests are necessarily unavoidable. Other shows are so badly managed that every one engaged in them is harassed and worried, and irritation, vexation, and annoyance are deplorably predominant. Of course there always will be some differences; and a good manager with a clear head, well-arranged plans, unquestioned authority, and a sufficient staff of assistants, will usually contrive to get through the work of a show with less worry and exertion and more success than an inferior man whose head gets muddled with the first hour's work, more particularly when, as too frequently happens, his authority is weak, his assistants inefficient or too few, and the arrangements are pretty much left to make themselves. It may be said that in marking the two classes of shows so broadly I am overstating the case: the good are too good, and the indifferent are made worse than they really are. My object I trust is obvious, and my method justifiable, for I want to indicate the limits, or something approaching them, on all sides; and I candidly confess that a large number of flower shows are both less perfect than my first type, and not quite so bad as my second. Still I maintain that the majority incline towards the worse kind in general characteristics, and it is with the hope of being able to offer hints which, if acted on, may help to mend matters, that I have undertaken to discourse a little at length concerning flower shows.

To begin at the beginning: the inception of a really well organised flower show will start with a carefully prepared schedule of prizes, which will vary in details according to the locality where, and the time when, the show is to be held. If the exhibits are to be drawn from the immediate neighbourhood, that circumstance will be borne in mind, and the exhibiting capacity of the probable competitors remembered. If the funds are sufficient to provide good prizes open to all comers the draughtsman of the schedule will not forget the

class of exhibitors he hopes to attract, nor be unmindful of the competitive power he desires to provoke. One of the main purposes of attracting important and well-known exhibitors from a distance is to show the local gardening community how plants, fruit, vegetables, and flowers are grown by the chief masters of the art, and so to impart valuable information and give a healthy stimulus; but another object, nearly if not quite as important, is to add to the attractiveness, extent, and general interest of the show in the eyes of the public. These two points must be borne in mind in fixing the amount of the prizes, and it will invariably be found desirable that there should be no very great difference in the money value of the first, second, and third prizes if a goodly number of exhibits from a distance are desired, for exhibitors are very materialistic, and remember that railway charges and other expenses are usually consumptive of coin, which they prefer to have provided for them out of the prize fund rather than their own pockets. There is usually too much money given for first prizes and too little for the second and third. The terms of the schedule and the regulations should all be clearly and explicitly stated, so as to leave no room for doubting what they really mean. This is a point of great importance, which is sadly neglected in many schedules.

The time for the closing of entries should be fixed with discrimination, so as to be near enough to the day of exhibition for the entries to be real and not illusory ones; so that the intending exhibitors may be in a position to decide with something approaching to positiveness what they will be able to exhibit. It should also be sufficiently long before the show to give the management time enough to make the necessary arrangements as to tents and other requirements. One of the commonest causes of trouble and disappointment at flower shows is the absence at the last moment of important exhibits, particularly collections of stove or greenhouse plants. Entries are made by several exhibitors to show in the most important class, and the manager is bound to provide sufficient tent-room for the accommodation of what promises to be a grand and extensive display. He apportions the space, and, already in anticipation, delights in the extent and beauty of the exhibition; and with a view to attract company he gets the friendly reporters to dilate in the columns of the local newspapers on the wonderful collections of plants that will be exhibited, which are stated to be so numerous that it will be necessary to provide far more tent-room than was anticipated, and all the neighbourhood is set talking. On the eve of the long-expected day every one is on tip-toe looking out for the arrival of the exhibitors' vans, and all kinds of anticipatory arrangements are made for the comfort of men and beasts. At length the first arrival is announced. Then after an interval comes another. Still there are most important absentees of whom no word has been heard. Night closes in, and the anxious manager retires to bed, but not to sleep the sleep of the contented, for vague doubts have begun to beset him that he will rise on the morrow and find his tents ready, but not the plants to fill them. Wearily the night passes, and with redoubled anxiety the manager rushes off to the exhibition-ground. One more arrival from a distance he finds, and no more. Knowing that these important exhibitors are always early on the ground, or do not come at all, he realises his worst fears. By-and-by the postman comes, and then he finds letters from A. and B. and C., regretting inability to be present, and expressing hopes that their absence will not be productive of inconvenience, &c. Then well-made arrangements are all upset; unsatisfactory re-arrangements have to be made; great blank spaces have to be dealt with as best they may be. Do what he can, the manager knows that when his company arrives they will see that they have been deceived, and that the flourish of trumpets has been executed to herald a ragged army. This is no overdrawn picture; it is a state of affairs constantly occurring, but which ought never, or only very rarely, to occur. How is it to be prevented? My own impression is, that every exhibitor who enters to show a collection of plants of an extent large enough to constitute a feature in a show, and demanding for its proper display any considerable amount of space, should be required to deposit with his entry a sufficient sum of money (£2 to £3, possibly more, according to the extent of the promised display), which should be forfeited in the event of the collection not being staged, unless at least three days before the show-day notice be given of intention not to exhibit, in which case half the money should be returned, the other half going towards the expenses incurred on the faith of the entry; the full deposit to be of course returned to all who stage according to their entries. *G. E. R.*

(To be continued.)

## SELECT INDEX OF PLANTS FROM 1841 TO 1878.—(Continued from p. 107.)

- HYBRIDISATION**—

## NOTES ON NEW ZEALAND PLANTS.\*

(Concluded from p. 76.)

15. *OLEARIA HAASII* (*Eurybia parvifolia*), Mr. Julius Haast's arborescent Aster, or Daisy.—A dense growing small tree or large shrub, with rigid ovate leaves, averaging about an inch in length, of a dull somewhat glaucous green on their upper surface and whitish below. A young plant, about 18 inches in height, growing in an open border, was not the least injured. In Hooker's *Handbook of the New Zealand Flora* twenty arborescent and frutescent species of this genus are described, most of which are natives of the Middle Island, where several of them are found at such high altitudes as to ensure their being suitable for our climate; and apart from the peculiarities of their foliage, their Daisy-like flowers would give a novel and interesting appearance to our shrubberies and woodlands. Like their near relation, that old greenhouse favourite the *Aster argophyllus*, or Musk-tree, several of them are musk-scented. The timber of the larger-growing kinds is hard, beautifully mottled or veined, and used for inlaying and veneering.

16. *VERONICA TRAVERSII* (W. T. Luke Travers' Speedwell).—A very pretty evergreen shrub, thickly clothed with small, light green, smooth, opposite leaves, which are regularly set in four rows along the branches. A plant about 18 inches high was perfectly uninjured, although several of the more generally known *V. decussata* of the Falkland Islands were completely killed in its vicinity. These last were from the island of Rousa, where, as well as in others of the Orkney Isles, this species may be said to have become naturalised, coming up abundantly from self-sown seed, and forming the best of shrubs for withstanding the violent sea winds of that comparatively mild climate.

17. *VERONICA SALICIFOLIA* VAR. (the Willow-leaved Speedwell and *Koromiko* or *Korimuka* of the natives, also known as *V. Lindleyana*).—Of this somewhat variable old inhabitant of our gardens I had seeds from Canterbury, New Zealand, about ten years since, which produced plants that were of a more rigid bushy growth, as well as decidedly hardier than those I had growing previously. They were, however, a good deal injured by the unusual severity of last winter, but are readily reproduced from self-sown seed.

18. *VERONICA PINGUIFOLIA*.—This small dense growing glaucous-leaved shrub is remarkably pretty at all times, but more especially when covered with its profusion of white flowers. It proved perfectly hardy in different situations; and is particularly suitable for rockeries.

19. *VERONICA HULKEANA*.—A somewhat slender shrub of about 3 feet in height, with dark green ovate leaves, from 1 to 1½ inch in length, and handsome large branched spikes of pinkish-lilac flowers. I had no plant of this species in the open air last winter, but previous experience showed it incapable of withstanding our severest frosts without suffering more or less. Its very handsome flowers, however, entitle it to a little protection from very hard frosts; and they recommend it as a pot plant for winter forcing, or blooming in greenhouses during spring.

20. *MUHLENBECKIA COMPLEXA* (*Polygonum complexum* and *Coccoloba complexa*—interlaced, or complex branched Supple-Jack).—A tough slender climber, rambling over bushes and trees to considerable lengths; but comparatively dwarf and compact when grown without support. Planted on the west wall of a two-storey house, it reached the slates in six years, and two years later, in 1877, it covered a considerable portion of the wall with its thickly interlacing slender branches, and a profusion of small pretty light green leaves. In August and September of that year it produced an abundance of inconspicuous green flowers, which, however, were not followed by the expected crop of its Mistletoe-like berries. Previous to last winter it never sustained the least injury from frost, but then many of the branches were so much affected that they had to be shortened or cut out. Of this very interesting plant I have cultivated two varieties,

the one having entire leaves, while those of the latter are deeply indented or contracted in their middle.

21. *LIBERTIA GRANDIFLORA MAJOR*.—A very handsome herbaceous evergreen, with stout grassy-like leaves, from 20 to 30 inches in length by a third to half an inch in width; and having spike-like panicles about 3 feet high of pure white showy flowers that are produced in succession from a month to six weeks. This variety, which I have grown about twelve years, has larger flowers and more compact panicles than that previously in cultivation. Till last winter it grew freely, flowering and seeding abundantly; but the plants then suffered less or more from the excessive frost, although none were entirely killed, and some even flowered and seeded last summer as profusely as before. The bulky produce of tough leaves which this *Libertia* yields claim for it the attention of paper-makers; and as an ornamental plant for flower borders, shrubberies, or moderately open woodlands, the abundance and pure whiteness of its flowers render it particularly attractive, while if once introduced where its self-sown young plants are allowed to grow up, it will maintain a conspicuous existence even among our stronger growing wild flowers.

22. *LIBERTIA INOIDES*.—A pretty white-flowered evergreen herbaceous plant, with more branched inflorescences than the last, and only about a third of its size. Well adapted for growing on rockeries, and perfectly hardy.

23. *CORDYLINA AUSTRALIS* (Cabbage-tree or Grass-tree of the settlers, and *Houka* or *Ti* of the Maoris).—In hopes of acquiring hardier forms of this well-known elegant Palm-like tree than those usually cultivated in our greenhouses, I, through the kind assistance of Mr. James Melvin, of Bonnington, Ratho, obtained seeds from its colder habitats in Otago, the plants raised from which grew for six or seven years, sustaining a minimum temperature of 20° without any artificial protection, by which time they attained a height of 3 to 4 feet; but a severe winter then killed them to the ground, with the exception of one which stood unharmed till last winter, when it also succumbed. The late Dr. Moore, of Dublin, who saw this plant in April, 1876, told me it was now recognised as a new species, named *C. calicoma*, and distinguished from *C. australis* by having flat instead of incurved leaves. The graceful growth and wind-withstanding properties of this Cabbage-tree and its varieties recommend them as portable summer decorative plants for growing in vases or large flower-pots, and they may be wintered in any glass-roofed structure without artificial heat.

24. *CHRYSOBACTRON HOOKERI* (*Anthericum Hookeri*).—A showy deciduous herbaceous plant, 1½ to 2 feet in height, with bright yellow flowers, having much the appearance of our pretty Bog Asphodel, *Narthecium ossifragum*, but larger in all its parts. Is quite hardy.

25. *PHORMIUM TENAX* (the New Zealand Flax or Flax Lily: *Harareke*, *Harakeke*, *Korari* and *Coradi* of the Maoris).—The highly interesting paper which was read at our last meeting from Dr. Wm. Traill on the growth of *P. tenax* in Orkney, where it flowered and perfected seeds last year, showed its greater suitability for that northern climate than for the occasionally severer winters that we experience in the Lothians. A minimum temperature of 15° seems about the lowest that it will stand without injury, so that the last winter minimum of 9° injured the tops of the leaves, and disfigured the plants considerably. Of late years several variegated leaved varieties of the *P. tenax* have been special objects of attraction in our greenhouses and flower shows, but they have generally been deemed too tender for outdoor cultivation; two of these, however, stood the last winter on my rockery fully as well as the ordinary green sorts, and all sent up fine young leaves in the course of the summer. All the varieties, when grown in large vases or flower-pots for outdoor decoration in summer, contrast effectively with the surrounding shrubs and flowers; and, like the *Cordylina australis*, may be wintered in glass-roofed structures without artificial heat.

26. *CAREX SECTA* (*Carex virgata*,  $\beta$  *secta*, the Grass-tree of settlers).—Is so called from its forming large tufts of roots from 1 to 6 feet in height, and 6 to 18 inches in diameter, somewhat resembling the stems of Tree Ferns. Three year old

plants have stood uninjured, without as yet showing any appearance of forming tufts or stems.

27. *ARUNDO CONSPICUA* (New Zealand Reed, *Tohi-Tohi* or *Toe-Toe* of the natives).—This tallest of New Zealand grasses frequently exceeds 10 feet in height; and bears a considerable resemblance to the now generally known Pampas-grass of South America (*Gynerium argenteum*), but its elegant feathery white panicles are produced in July instead of October, like those of the latter, compared with which it is decidedly more tender, and was so much injured last winter that my old plant had to be lifted, and those portions that were alive replanted.

28. *POLYSTICHUM VESTITUM*?—Height 6 to 10 inches. This Fern has stood in my rockery without protection for the last fourteen years, and its remarkably dark green, rigid shining fronds, entitle it to much more general cultivation than it has yet received.

29. *TODEA SUPERBA* (*Leptopteris superba*, the superb New Zealand Filmy Fern).—This most elegant of Ferns has grown well with me for the last six years in a cool frame at the north back of a garden wall, having only a thin covering of tiffany under the glass to ensure for it the deep shade of its native forest habitats. When the plant came into my possession its fronds were only about 9 inches long, but now several of them are more than twice that length. On lifting the frame-sash where it was growing during the hardest frosts of the present and last winter, I found the soil about it a solid frozen mass, while its densely crowded minute pinnae, which retain the condensed moisture, were separately enveloped in a white icy covering, so that the fronds far surpassed the finest ostrich feathers in elegance.

30. *CLIANTHUS PUNICEUS* (the Glory Pea and Parrot-beak flower of the settlers, and *Kowhai ngutu-kaka* of the natives).—This being, according to Sir J. D. Hooker, a native of only the Northern Island, or New Ulster, it has since its introduction to Britain in 1832 been generally treated as a greenhouse plant, although in numerous instances it has survived mild winters on southerly exposed walls. A variety having much smoother leaves than the original, which was raised in England and named *C. p. magnificus*, is also much hardier than it, and has fully as beautiful racemes of 2 to 2½ inches long scarlet flowers. A well spread plant of this variety on a south wall attained with me a height of about 14 feet, and had upwards of a thousand flowers all fully expanded at one time. Next winter, however, it was killed down to within 3 or 4 feet of the ground, and although two seedlings from it flowered and seeded in the open ground in summer 1877, they were both killed in the succeeding winter; but several residents at Bute and other Clyde-side watering places to whom I gave seeds were more successful with their products.

In concluding these remarks on the few New Zealand plants which have been objects of cultural experiment with me, I may state that their number is much too limited, and the indigenous habitats of most of them are at too low altitudes to convey any idea of the variety and extent of the botanical treasures suitable for our climate which still await introduction from the snow-capped Canterbury and Southern Alps, as well from other elevated mountain ranges, of which may be mentioned the following from among other trees and shrubs:—At least ten Leguminosæ, six Saxifragæ, four Myrtaceæ, eight Araliaceæ, twelve Rubiaceæ, thirty Compositæ, twenty Ericæ, five Cupuliferæ (evergreen Beeches), and ten Conifere. One Palm, the *Areca sapida*, found on the higher parts of Banks' Peninsula, and above the lower glaciers on Mount Cook. Herbaceous plants in immense variety and many of them of great beauty; while for the quantity and elegance of its Ferns, New Zealand is not surpassed by any country of like extent in the world.

In 1850 Mr. John Jeffrey, and in 1863 Dr. Robert Brown, were sent to North-west America as botanical collectors by an association which originated in Edinburgh. Could not such an association be now organised for sending an efficient botanical collector to New Zealand? And if so, it would be well to secure the co-operation of proprietors on the western and northern coasts and islands of Britain, where the mildness of the winters would be most conducive to the success of the introduced plants, and where they might be extensively reared and grown by private or public enterprise, such as in a botanical garden

\* "Notes on New Zealand Plants that withstood the severe winter of 1878-9 at Rait Lodge, Trinity, near Edinburgh." A paper read at the January meeting of the Botanical Society of Edinburgh, by William Gorrie, of Rait Lodge.

having a judiciously selected site, for of all botanic gardens now in Britain only one of any importance, viz., that of Liverpool, is situated within the influence of the west-coast climate, and even compared with it many much more favourable sites could be got along the western coasts of Scotland. As showing that this notion of introducing the hardier plants of New Zealand has been one of some standing with me, I may mention that at a meeting held in 1863 to consider the best place for sending Dr. Robert Brown to as a collector, on the question being put to me by George Paton, Esq., of The Carnies—afterwards the Lord Justice Clerk—I unhesitatingly replied, "To the great western mountain range of the Middle Island of New Zealand;" which was met by the objection "That place has never been thought of; and besides it cannot be got at as there is no shipping or trade connected with it." The finding of gold has since however brought both shipping and trade to it; and yet its native flora is almost as little known to British cultivators as ever.

In addition to the scientific names of New Zealand plants in the preceding list, those applied by the settlers and natives are also given, so far as they are known, as by such names collectors can get any kinds of seeds they may be in want of, with more ease and certainty than by using the botanical names only.

### A CONSERVATORY AND BILLIARD-ROOM.

The illustrations (figs. 32 and 33) represent the plan and interior view of a conservatory and billiard-room now approaching completion at Theydon Grove, Epping, the residence of J. Finlay, Esq., and we commend the design to the attention of our readers as exhibiting a very convenient, handsome, and appropriate arrangement of these two ornamental and luxurious additions to a gentleman's mansion. It will be seen on reference to the plan of the conservatory, and the view, which is shown as it would be seen by a person standing at the door of the drawing-room, that the main pathway is exactly opposite the drawing-room door. It is about 50 feet long, and terminates in a bay, which faces a terrace walk in the grounds. This walk is of considerable length, and leads to a small artificial lake, the whole forming a splendid vista. The desire to preserve and augment the effect of this vista led to the somewhat peculiar arrangement of the conservatory.

The main roof runs the whole length of the building, and the ornamental lantern which surmounts it is central with the pathway below and the terrace, while the east front has three domed roofs—the middle one, which embraces the entrance from the east terrace, being rather larger than the others. The various gutters are supported by handsome iron columns with enriched caps and bases and ornamental brackets. The interior is tastefully laid out with stages and beds, baskets hang from the roof in various positions, while directly opposite the east terrace is a small pond and fountain, and an archway in rockwork for Ferns.

At the north end of the conservatory and close to the drawing-room door is the entrance to the billiard-room, a spacious and highly ornate apartment, exhibiting several novel features. In the first place, the wall between it and the conservatory is pierced by several windows of plate glass, the central one, which is very large, having a particularly pleasing effect. This window on the conservatory side is surrounded by the rockwork archway before mentioned, so that a person standing in the billiard-room, or seated in the recess on the west side, commands an uninterrupted view through this window, under the archway, past the fountain, through the conservatory, on to the east lawn. At the south end, and divided from the billiard-room by a handsome colonnade, is a raised smoking gallery, to which is attached a lavatory, &c. We understand that the billiard-table is to be placed on a brass railway flush with the floor, so that it can be wheeled into the recess on the west side of the room, thus converting it into a very handsome and convenient ball or concert-room. In either of these cases the smoking gallery would be utilised as a place for the band or orchestra. It is also intended, with a view to this, to place an organ in the recess at the back of the gallery. The buildings were erected by Messrs. J. Weeks & Co., of Chelsea, by whom they were also designed.

### KUBANKA AND SAXONKA WHEAT.

(Concluded from p. 108.)

At what time this form of Wheat was first called Saxonka I do not know. I have compared it, in both the white-chaffed and red-chaffed ears, with awny spring Wheat, and they do not differ from each other in the very slightest particular, but seem to be both one variety.

No one regards our common spring Wheat as a degenerate form of Wheat. That the farmers of Samara call Saxonka a "degenerate" Wheat may point to what they believe, but no more proves that it is derived from Kubanka than the analogous belief that Darnel (*Lolium temulentum*) is degenerate Wheat, proves a genetic relationship between Wheat and Darnel. Nor do the experiments of Professor Buckman with one of the varieties of the wild Oat (*Avena fatua*) seem to possess any higher value. The culti-

pleasant gusto, the Wheats having high percentages of starch are better.

Now in the London market Kubanka has sometimes been regarded as a good Wheat, and sometimes as inferior to lighter Wheats. In the minutes of evidence of a select committee of the House of Commons on the "Sale of Corn," of date 1834, an "agent for the purchase of foreign grain" states that the Kubanka Wheat, weighing 63 lb. to 64 lb., is worth 25 per cent. less than Dantzic Wheat weighing 60 lb., the reason being that the Dantzic gives whiter flour. Again, in a work on *Wheat*, published in 1865, it is stated that Kubanka under proper management yields flour of great strength, and that it astonished the London millers and bakers, producing 108 loaves to the sack.

We see, therefore, that this question of transmutation is only confused by being looked at in relation to fluctuating opinions. If a plant were to become fitter for the support of man, that would be no proof that it

FIG. 32.—GROUND-PLAN OF A CONSERVATORY AND BILLIARD-ROOM AT THEYDON GROVE.

REFERENCES TO PLAN:—A, Conservatory; B, Billiard-room; C, Stepped stages; D, Beds; E, Ornamental tile floor; F, Glass door leading into Drawing-room; G, Fountain, with rockwork on each side; H, Billiard table; I, Cues; J, Card table; K, Recess for seat or table; L, Seat; M, Recess for organ; N, Raised smoking gallery; O, Lavatory, &c.

vation of other experimenters has not turned the wild Oat into a "Tartarian" or into a "Potato Oat." The wild Oat has been as long in cultivation as any cereal Oat (see Virgil's *Georgics*, lib. i.), but it has as yet retained its characteristics, frequently throwing up fifty stalwart culms from one seed, carrying many thousand returns, and maintaining such a firm hold of its cosmol environment as to completely defy extirpation.

Why the Saxonka form of Wheat should be regarded as degenerate is certainly not obvious from the plant itself. The quality of a Wheat is relative; there is no general standard of comparison. If a variety called A produces 4 qr. to the acre, and a variety B produces 6 qr., B is the better Wheat for the farmer. But if A produces a higher percentage of fine flour than B, then with the miller A is the better Wheat; and again the Wheat whose flour absorbs the greatest weight of water is probably the better Wheat in the estimation of the baker. With certain chemists the Wheat which contains the highest proportion of flesh-formers is best, while with those people who do not wish to become fat, and desire a

had cosmically improved; or if it became less fit for human purposes, that would be no proof that it had cosmically degenerated. The question is not whether a plant has improved or degenerated, but whether it has changed. Evolution is not the slave of humanity. It is simply the collective process going on about us, of which we learn to take more or less advantage. Whether, therefore, Saxonka Wheat is a degenerate Wheat as compared with Kubanka, under any assigned category, is not a question of evolution, and any solution of it would throw no light upon the real inquiry, which is simply this, Did Saxonka Wheat come from Kubanka seeds? The various forms of Wheat have been wandering over the face of the earth and mixing familiarly with each other from immemorial time. No pure stock of Kubanka—(Is this name from the river Kuban?)—of any extent ever came into Samara or any other country. And as the complete proof of transmutation would be extremely easy, requiring only that a Kubanka seed, planted beside a pin to mark the spot, shall be surmounted by a Saxonka plant, or some element of it, no amount of collateral plausibilities can be accepted.

When the history of the cereals is written, the chapter on transmutation will embrace opinions from all ages. Parkinson, reviewing certain ancient notions (*Theatrum Botanicum, Cerealia*), tells us that "Galen writeth that both he and his aged father, who tooke delight in husbandry, having sowed both Wheate and Barley very well cleansed from any other seede, of purpose to prove whether they would change their natures into Darnell and haver-grasse, or whether these were natural seedes of their owne kinde, found that much Darnell rose among the choise Wheate, and much Egilops or haver-grasse among the Barley; whereby it seemeth he doth confirme that current opinion, that these and other graines and seede will change into others either better or worse; but surely I could never meete that countrie or husband man that could certainly prove it (although some have averred verbally and earnestly) that there was any such metamorphosis."

In what direction we should search for an explanation of higher fertility in one form of a cereal or other seed, than in some other closely allied form, may not be easily determined. But there can be no doubt of the existence of the principle in animal as well as vegetable life. I have seen the two-rowed

cosmical materials. But whether the relationship between one form of vegetable life and other forms is a biogenetic or a cosmical relationship—that is, whether one form of life originates from other forms of life, or whether those causes which are capable of originating one form of life are capable of originating all forms of life—is not settled by the acceptance of evolution.

In all probability the causes which bring about whatever change from one form to another does actually take place, are dependent on the cosmical processes in current operation, and make no appreciable show even in the lapse of many human generations. We know that the form of the ear of a Wheat already exists in the embryo from which it is to grow. In the forty or sixty embryos standing in a Kubanka spike coming to maturity in the autumn sunshine, exist forty or sixty microscopic ears of the Kubanka form and not of some other form. And if they are there in virtue of existing cosmical forces, whence are the forces which shall alter them? The form of a plant cannot be permanently altered but by the alteration of that collocation of cosmical influences which gives it whatever statical permanence it possesses. A mere physiological amplification or de-

animals, merely going round the sun, like the hands of a clock, to tell the number of the years; they are living organisms and are being carried round, not by barren projections, but by the very forces and forms of matter which require this carrying round to work out the evolution of planetary globes. The evolution and the life of plants and animals are intelligible only on the assumption of the current evolution of their platform. The earth does not go round the sun for nothing or by way of holiday; it is carried round the sun by forces perpetually present, for the very purpose of being enlarged from the actual materials thrown out in the sun's decomposition. And these contentions do nothing but complete the logic of the sense of seeing. But never till this view becomes accepted science is it possible that our eyes should be opened to the creative drama now being played before us. And never can this view become accepted science, till the curtain of a specific ether with its fictitious scenery be drawn aside, and it be seen that the common matter which appeals to sensation has forms which appeal to all the senses, necessarily demanded by the very fact of their evolution. *A. Stephen Wilson, North Kinnmundy, Summerhill, by Aberdeen.*

FIG. 33.—CONSERVATORY AND BILLIARD-ROOM AT THEYDON GROVE, EPPING. (SEE P. 172.)

variety of Barley called Italian, which has a thick-set ear, planted in the same conditions as the two-rowed variety called Chevalier, which has a thin-set ear, and the latter producing from fifty to eighty ears, while the former did not go beyond twenty and thirty. Higher fertility is therefore a *vera causa* in the supplanting of one form of Wheat by another, and may be seen in operation and studied in the lifetime of a man.

I have thus placed high fertility, or a high reproductive power, as the chief cause why one form of Wheat, in certain circumstances, exterminates other less prolific forms, and seems to transmute these other forms into its own. But doubtless there is sometimes a concurrence of favouring causes. In the case before us, the Saxonka form of Wheat is not only more prolific, except on rich virgin steppe land, it also comes sooner to maturity; the seeds are more easily shaken out of the pales by wind, so as to produce self-seeding; and it has the capacity of living on less food than the Kubanka. It is brought to the front, not by the transmutation of other forms, but by that combination of cosmical forces which selects one line of vitality in preference to another; life is most prevalent on the easiest lines of vitality, and the more prevalent forms of life are probably those which are most in harmony with current rearrangements of

duction, a physiological resultant or sum, is not a biomorphic evolution. We have not yet got beyond the notion that such periods as our seasons, or the long journey of the major axis of our planet's orbit round the heavens, are mere dead cycles. There are no cycles, and the motions taking place are but marks of the life of the evolution which has brought our Wheats to their present form. Such experiments as the present have no philosophical interest except in whatever degree they help to clarify our vision as to the current creative processes going on around our doors.

It is now twenty-five years since, in a small book called *The Unity of Matter* (1855), I made the contention that the interpretation of Nature logically demands that the phenomena of sight, like the phenomena of the other senses, should presuppose, not a specific ether filling all space, but an appropriate form (an ethereal form) of the common fund of matter which appeals to other senses than vision; and that consequently a transfer of matter from the great solar decomposition into the structure of the planets, for the very purpose of carrying them to higher stages of evolution, is the very work which is on hand, the very explanation of what all this cosmical stir is about. The planets are not dead and finished supports of living plants and

### Foreign Correspondence.

KING WILLIAM'S TOWN, SOUTH AFRICA: Dec. 27, 1879.—*Grevillea robusta*.—We have for about four months experienced a very severe drought, which still continues, and the manner in which a well-known favourite of the sub-tropical garden at home has withstood such a trial induces me to say a word in its favour. I allude to *Grevillea robusta*, of which we have some fine specimens from 40 to 50 feet in height of about ten years' growth. Notwithstanding that they have been for some time covered with their very showy orange-coloured racemes of bloom, and are now heavily laden with seed—the most exhausting period of a tree's existence—they do not appear to be suffering in the least, their truly elegant and graceful foliage having that rich dark-green hue which is characteristic of robust health, though they have no artificial watering, and are growing at too great a distance from any water for the roots to reach.

I think it is certainly worth planting extensively in this, at present, desert-like country, which, but for the long-continued droughts we suffer from, would be one vast garden. I do not know what is the quality of the timber, but if any of the readers of the

*Gardeners' Chronicle* who have seen it used in Australia or elsewhere would enlighten me on this point I should be much obliged.

*Casuarina equisetifolia*.—There is one other beautiful tree which has stood equally well—the *Casuarina equisetifolia*, or Beefwood—a native of the South Sea Islands; this has about the same rate of growth as the *Grevillea*, with a clean, straight stem, and graceful foliage, which is well described by its specific name.

*Acacias*.—Two other Australian trees which make noble specimens here are *Acacia dealbata*, the Silver Wattle, and *Acacia Melanoxylon*, the Blackwood, but of these many would have died had they not been supplied with water. This latter is the favourite tree for street planting in this district, and where there is a small stream of water constantly running down each side of the roadway, which is not uncommon, there is not a finer tree for the purpose—a really well-furnished shady avenue being obtained, under these favourable circumstances, in five or seven years, the trees being planted when one year old.

*Oaks*.—There is a nice avenue in the garden of Oaks (var. *pedunculata*). The Oak does extremely well here, but most of the leaves at present have quite a white appearance—the effects of hot winds which we experienced on the 24th and 17th inst., when the thermometer registered 150° in the sun and 108° in the shade (Fahrenheit).

The Gums, *Eucalyptus globulus*, and other species of course far outstrip any of these in rapidity of growth, and stand well in either wet or dry situations when once established, but they are not to be compared with any one of the above for handsome appearance.

There are other things worthy of notice, but I must conclude this time with the wish that it had been possible to have exchanged a little of our weather for some of the surplus rain you have had during the past season. *J. C. Nelson, Curator, Botanic Garden, King William's Town, British Kaffraria, Dec. 27.*

BOSTON, MASS., U.S.A.: *Two-flowered Cypripedium insigne*.—I do not know whether it is a common thing with your cultivators to grow specimens of this pretty old plant with two flowers on each stem; it is occasionally seen in this way in some of our collections, but we believe it is rarely, if ever, that every stem on a single plant produces two flowers. Such a specimen was recently exhibited before the Massachusetts Horticultural Society, January 3, by Mr. J. Tailby of Wellesley. The plant was in an 8-inch pot, had nine stems, and every stem produced two flowers, one of them springing from the sheath at the base of the first flower. Such a specimen was thought so remarkable that Mr. Tailby was requested to give some account of his treatment, and at the last meeting, January 10, the subject for discussion was this *Cypripedium*. Mr. Tailby gave a detailed statement of his mode of culture, but it differed in nothing from that which is customary except in the material in which it was potted. This was sphagnum and coarse sand only, with plenty of liquid manure during its growth. Mr. Tailby thought he had done all this by his treatment of the plant, and believed he could produce three flowers on a stem. Other cultivators thought it only an accidental circumstance, and could not be done with the same plant again. This remains to be seen. As a novelty in culture it was certainly quite remarkable, and I should be glad to know if it is a common occurrence. *C. A. Hovey, Jan. 11.*

## Florists' Flowers.

**DAHLIAS FROM SEED.**—Some of our Dahlia raisers must have reaped a short harvest of seed during the unpropitious autumn of 1879. It was not so much that the flowers did not produce seeds as that the season proved so late; the seeds had scarcely time to develop, and the persistent autumnal rains caused many of the matured seeds to rot. Still, some were obtained, and though the seedling Dahlias raised in 1880 will not be so numerous, in all probability, as in previous years, the floral succession will not be broken, and some yearling plants will be surely forthcoming to reward the labours of the florist.

Messrs. Keynes & Co., Castle Street Nurseries, Salisbury, the foremost raisers of Dahlias in the present day, plant out every year about 15,000 seedling Dahlias for trial. It is only the very finest flowers—distinguished by symmetry, colour, and

perfection of petal as well as of centre, that are permitted to carry seed. As the petals decay they fall from the flowers, and if any adhere they are removed, so that they may not become vehicles for conveying rot to the seeds. In wet weather the pods are gone over occasionally and the moisture squeezed out of them, for it is the practice to leave them on the plants till frost sets in, in order that the seeds should become as fully developed as possible. When the pods are cut they are removed with stems and tied in bunches, a dozen or so in a bunch, and left hanging in a drying place two or three days, and then opened, for it is found if this be too long delayed the seeds will suffer. The seeds when taken from the pods are dried, and then made up into packets of a hundred or so, and put away in a drawer till wanted, but the seeds should not be packed away till dry.

The time to sow is at the end of March. The seeds are sown in shallow pans or well-drained pots placed in a brisk, moist heat, when they soon germinate, and if grown on carefully increase rapidly in size. It was a part of the late Mr. Keynes' practice to place the pans containing the soil for the seed in heat a day or two previously, to get it thoroughly warmed before sowing. Mr. Keynes found that the best seed—that which produced good flowers—was generally very thin, and he said he cared little for plump seeds, the progeny was invariably disappointing.

Those who deal with but few seedlings can pot them off so soon as large enough, and grow them on into size. In dealing with an enormous number, they can be pricked off into store-pots, pans, or boxes, or put out into a warm frame, and kept till planting-out time. They are then planted out in a piece of good ground, previously deeply dug and well manured and prepared for their reception. The Dahlias are put out in lines, which are some 20 inches apart, and the plants themselves 6 inches apart in the lines. A very large number of the inferior varieties bloom early, and they are at once pulled up by the roots and thrown away. Any promising flowers are marked and a description taken of them. Out of the large number of seedlings Messrs. Keynes & Co. raise in a year, they are satisfied if they obtain from fifty to sixty promising flowers, and these are propagated from the following year, and well cultivated, so that their capabilities can be displayed to the utmost. A seedling is always grown for two years before it is sent out, in order that any change of character may be made apparent. Sometimes a flower that had shown itself in high-class character till the time for sending out will deteriorate after being distributed, and become of little or no value for exhibition purposes. In 1852 Mr. C. Turner, of Slough, purchased from Mr. George Wheeler, of Warminster, for the large sum of £105, the stock of Queen Victoria, a flower of rare merit at that time, having a rich yellow ground, the petals handsomely tipped with carmine-crimson, and of symmetrical build. At the end of 1854 it was said of this promising variety:—"Queen Victoria has been exhibited on one occasion only, when it created quite a sensation. Shall we be going too far if we venture to predict that, as a show flower, we have 'looked our last' on this variety?" The prediction came true, the blooms came hopelessly hard-eyed, and the variety had to be thrown out of cultivation.
